

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## LIFE BELOW THE SURFACE.

INCIDENTS AND ACCIDENTS

BEYOND THE LIGHT OF DAY; STARTLING ADVENTURES IN ALL PARTS OF THE  
WORLD; MINES AND THE MODE OF WORKING THEM; UNDER-CURRENTS  
OF SOCIETY; GAMBLING AND ITS HORRORS; CAVERNS AND THEIR  
MYSTERIES; THE DARK WAYS OF WICKEDNESS; PRISONS  
AND THEIR SECRETS; DOWN IN THE DEPTHS OF  
THE SEA; STRANGE STORIES OF THE  
DETECTION OF CRIME.

BY

THOMAS W. KNOX.

AUTHOR OF "CAMP-FIRE AND COTTON-FIELD;" "OVERLAND THROUGH ASIA,"  
"THE BOY-EXILES," ETC.

---

HARTFORD:  
THE J. B. BURR PUBLISHING CO.  
1874.

**Entered, according to Act of Congress, in the year 1873,  
By J. B. BURR & HYDE,  
In the Office of the Librarian of Congress, at Washington.**

## P R E F A C E .

---

IN presenting this volume to the public the author would say that it has been his endeavor to make a book in which he could describe the life, not only of the miner, but of all who work under ground — whether literally or metaphorically. By interspersing the story with numerous anecdotes and incidents he has hoped to render its perusal less fatiguing than it might be had he restricted his labors to collecting a mass of dry details, and making a liberal use of technical terms. A glance at the table of contents will show how far he has travelled out of the beaten track in his effort to throw light upon dark subjects, and draw attention to a topic that might be wearisome if treated in its most restricted form. He has not confined himself to any one part of the globe, and the most of the incidents which he narrates are now for the first time given to the public.

The author has not hastily performed his work. Neither has he relied solely upon his own efforts and information, as he well knows that no one person, however industrious, can gather all that may be known upon any important subject. Remembering the adage that two heads are better than one, and supplementing it with the assertion that ten heads are better than two, he has employed all means in his power, and secured the assistance of others, in order to make this book as comprehensive as possible. He has consulted many books on mining matters and kindred subjects, and devoted much time to a careful investigation of the works of various scientific and popular writers. He has been

specially indebted to Professor Simonin, the author of *La Vie Souterraine*, and has relied upon him for many facts and figures, especially in reference to the coal mines of France and other countries. Numerous books of travel have been examined, files of newspapers have been searched, and many individuals, familiar with subjects which it was proposed to treat, have been consulted in the author's wanderings after light. He trusts that his labors will not prove to have been in vain.

Several literary gentlemen have aided the author in his enterprise. He is permitted to mention, as among these, Mr. Junius Henri Browne, of New York, and the late Colonel Albert S. Evans, of San Francisco.

In preparing the matter for the press, it has been found convenient to make use of words borrowed from the French and other languages, and also of terms more or less technical in their character. They are not numerous, and are so well understood either by context or by popular use that a glossary is not considered necessary.

The author takes this opportunity to thank the newspaper press and the public for the generous reception accorded to his previous publications, and, in the language of the business card of the period, he hopes to merit a continuance of the same.

T. W. K.

ASTOR HOUSE, NEW YORK,  
May, 1873.

# CONTENTS.

## IV.

## OPERATIONS AT HELLGATE.

HELLGATE AND SANDY HOOK. — ENTRANCES TO NEW YORK HARBOR. — THE HELLEGAT AND ITS MEANING. — STORIES OF THE OLD VOYAGERS. — EDITORIAL JOKES. — MAILLEFERT'S OPERATIONS. — DEEPENING THE CHANNEL. — GENERAL NEWTON. — THE AUTHOR ON AN EXCURSION. — BLOWING UP COENTIES' REEF. — HOW IT IS DONE. — AN ACCIDENT WITH NITROGLYCERINE. — THE AUTHOR'S NARROW ESCAPE. — DIVER'S EXPERIENCE. — ASTONISHING THE FISHES. — RECEPTION AT HALLETT'S POINT. — GOING UNDER THE REEF. — THE MEN AT WORK. — AN INUNDATION. — HOW THE REEF IS TO BE REMOVED. — SURVEYING IN THE WATER. — A GRAND EXPLOSION. . . . . 63

## V.

## BORINGS AND SHAFTS.

HOW COAL MINES ARE DISCOVERED. — OUTCROPPINGS. — SCIENTIFIC RESEARCHES. — HOW A MARLBE QUARRY WAS FOUND. — BORING A WELL, AND WHAT CAME OF IT. — A LOCAL BEBATING SOCIETY. — INTIMATE RELATIONS OF COAL MINES AND THE STEAM ENGINE. — STRIKING OIL. — "DAD'S STRUCK ILE." — THE UNHAPPY MAIDEN'S FATE. — COAL INSTEAD OF WATER. — THE TOOLS TO BE USED. — A DEEP HOLE. — TERRIBLE ACCIDENT, AND A MINER'S COOLNESS. — SINKING SHAFTS. — AN INGENIOUS APPARATUS. — ACCIDENTS IN SHAFTS. — REQUIREMENTS OF THE LAW. . . . . 79

## VI.

## ACCIDENTS IN SHAFTS.

ADVENTURE OF THE AUTHOR DESCENDING A SHAFT. — A MINUTE OF PERIL. — LIFTED THROUGH A SHAFT BY ONE LEG. — A COLLISION IN MID-AIR. — SENSATIONS OF THE DESCENT. — A MINER'S VIEWS OF DANGER. — PICTURESQUE SCENE AT A DESCENT. — OFFERING PRAYERS. — SCENE AT A RUSSIAN MINE. — SAFETY CAGES. — THEIR CONSTRUCTION. — A LUDICROUS INCIDENT. — HOW A MAN FAILED TO KEEP AN ENGAGEMENT. — DOWN IN THE SALT MINES OF POLAND. — A PERILOUS DESCENT. — "PLENTY MORE MEN." — ACCIDENT NEAR SCRANTON. — "PUTTERS." — HOW GIRLS WERE USED IN SCOTLAND. — MAN ENGINES. — THE LEVELS. — AN ACCIDENT CAUSED BY RATS. . . . . 91

## VII.

## SPECULATIONS IN NEVADA MINES.

MINING SPECULATIONS. — SWINDLERS IN NEW YORK AND BOSTON. — THE AUTHOR'S EXPERIENCE. — HOW HE WAS CAUGHT. — THE HOOK AND THE WAY

TO BAIT IT. — LIMITED INVESTMENT. — THE ADVENTURER'S STORY. — FACTS AND FIGURES. — THE ROMANCE, AND THE SUBSEQUENT REALITY. — ONE HUNDRED PER CENT. A MONTH. — IRISH DIVIDENDS. — EXPLOSION OF THE BUBBLE. — THE VICTIMS AND THEIR FATE. — NANKEEN TROUSERS IN WINTER. — AN ADVENTURER'S EXPERIENCE IN LONDON. — HOW HE CAUGHT A CAPITALIST. — HELD BY THE GLITTERING EYE. . . . 106

## VIII.

## BURGLARS AND BURGLARIES.

REMARKABLE BURGLARIES. — UNDER GROUND FOR DISHONEST PURPOSES. — WONDERFUL ADROITNESS OF BURGLARS. — A REMARKABLE ROBBERY. — OCCUPATION OF A LAWYER'S OFFICE. — LABOR UNDER DIFFICULTIES. — A TROUBLESOME POLICEMAN. — STRANGE SCENE IN COURT. — THE CULPRIT'S REPLY. — ROBBERY BY COUNTERFEIT POLICEMEN. — THE OCEAN BANK ROBBERY. — RAPID AND THOROUGH WORK. — AN ASTONISHED WATCHMAN. — BAFFLING THE POLICE. . . . 116

## IX.

## ADVENTURES OF DIVERS.

GOING UNDER WATER. — PEARL DIVING. — COSTUME OF THE DIVERS. — HOW THEY DESCEND. — OBTAINING THE PEARL OYSTERS. — DIVING-BELLS. — HOW THEY ARE MADE. — ADVANTAGES AND DISADVANTAGES. — ADVENTURES IN DIVING-BELLS. — SUBMARINE ARMOR. — ITS CONSTRUCTION AND USE. — A DIVER'S ADVENTURE. — A HORRIBLE SIGHT. — THE DIVER'S STORY. — A PEARL DIVER AND A SHARK. — A NARROW ESCAPE. — STRATEGY IN THE WATER. . . . 129

## X.

## EXPLOSIONS IN MINES.

THICKNESS OF COAL SEAMS. — STUPIDITY OF A TURKISH MINING SUPERINTENDENT. — THE RESULT. — BLASTING IN MINES. — HOW IT IS DONE. — TERRIBLE ACCIDENTS. — MINES ON FIRE. — SCENES OF DEVIATION. — EFFECT OF SUBTERRANEAN FIRE. — EXPLOSIONS OF FIRE-DAMP. — HORRIBLE ACCIDENTS. — STORIES OF SURVIVORS. — LOSS OF LIFE. — SCENE IN A WELSH MINE. — EXPLOSIONS IN ENGLISH AND AMERICAN MINES. — MODES OF RELIEF. — STORY OF TWO BROTHERS. — HOW THEY WERE SAVED. — THE SAFETY-LAMP. — ITS CONSTRUCTION. — THE FIRE-WALLS OF CHINA. — THE PENITENT AND CANNONEER. . . . 140

## XI.

## A DAY IN POMPEII.

A VISIT TO POMPEII — NEAPOLITAN HACKMEN. — AN INTERESTING ADVENTURE. — HOW TO AVOID A QUARREL. — BEGGARS. — BEGGARY AS A FINE ART. — A PICTURESQUE SCENE. — MAKING MACARONI. — TRICKS OF AN OLD ROOSTER. — POMPEII. — ITS HISTORY. — DISCOVERY OF THE BURIED CITY. — A SCENE IN THE STREETS. — AN ANCIENT BAKERY. — HOW THE MILLS WERE TURNED. — INVESTIGATING AN OVEN. — A WONDERFUL DISCOVERY. — PRESENT CONDITION OF THE HOUSES. — ADVERTISING IN OLD TIMES. — POMPEIIAN PERSONALS. — A PICTURE OF THE DESTRUCTION. — OBSCENE OBJECTS IN THE CITY. . . . . 152

## XII.

## VESUVIUS AND ITS ERUPTIONS.

THE GREAT ERUPTION OF VESUVIUS. — WHAT IT DID. — THREE CITIES WIPED OUT — LAVA AND ITS CHARACTER. — GOING TO THE MOUNTAIN. — SKIRMISHING WITH GUIDES AND BEGGARS. — ARCHITECTURAL STEEDS. — A HORSE WITH A HAND RAIL AROUND HIM. — COAT-HOOKS TO LET. — A MOTLEY CROWD. — HOW AN AMERICAN WAS MOUNTED. — A NEW MODE OF SPURRING. — THE ROAD FROM RESINA. — BURNING LAVA. — CROSSING THE LAVA BEDS. — CLIMBING ON FOOT. — HAPS AND MISHAPS. — AN ENGLISHMAN'S ACCIDENT. — LIGHTING A CIGAR AT THE CRATER. — SUFFOCATED BY SULPHUR FUMES. — DOWN AMONG THE ASHES. — A LONG FALL AND SLIDE. — IN HERCULANEUM. — UNDERGROUND BENEATH THE CITY. — "LOOK HERE." — HOW THE CITY WAS DISCOVERED. — THE ERUPTION OF 1872. — HORRIBLE SCENES. — EXTENT OF THE DESTRUCTION. . . . . 169

## XIII.

## PERILS OF THE MINER.

NARROW ESCAPE OF THE AUTHOR. — CAUGHT IN A LEVEL. — SETTLING OF THE ROOF. — BREAKING TIMBERS. — A PERILOUS PASSAGE. — FALLING OF A ROOF. — THREATENING DANGERS. — ADVENTURE OF GIRAUD, THE WELL-DIGGER. — CAUGHT IN A FALL OF EARTH. — THREE WEEKS WITH A CORPSE. — ONE MONTH WITHOUT FOOD. — HOW HE WAS RESCUED. — A MINER COVERED WITH COAL. — HIS RESCUE. — AN IRISHMAN'S JOKE. — INUNDATION. — CURIOUS THEORIES OF THE MINERS. — EFFECT OF STRIKING A VEIN OF WATER. — DRAWING THE MEN IN A MINE. — THE SEA BREAKING IN. — CLOSING THE SHAFT. — A TERRIBLE STORY. — EXPERIENCE OF A FRENCH ENGINEER. — CASUALTIES AND THEIR NUMBER. — SUFFOCATION OF THREE HUNDRED AND SIXTY ONE MEN IN ONE MINE. . . . . 188

## XIV.

## INUNDATION AT LALLE.

INUNDATION OF A MINE ON THE LOIRE. — HOW THE MEN WERE SAVED. — SONG OF THE PUPILS OF THE MINING SCHOOL AT ST. ETIENNE. — TERRIBLE FLOOD OF A MINE AT LALLE. — BREAKING IN OF A RIVER. — COURAGE OF AUBERTO, A WORKMAN. — SAVING SIX LIVES. — PLAN FOR RESCUE. — DISCOVERING THE WHEREABOUTS OF THE PRISONERS. — ONE MONTH'S WORK IN THREE DAYS. — OPENING THE DRIFT-WAYS. — SIXTY FEET OF TUNNELLING. — IN THE DARKNESS WITH A CORPSE. — STORY OF THE RESCUED. — THIRTEEN DAYS OF PERIL. — FINDING THE BODIES OF THE DEAD. — ONE HUNDRED AND FIVE MEN DROWNED. — SAVING A CHILD. — EATING WOOD AND LEATHER TO SAVE LIFE. — A HORRIBLE SIGHT. . 199

## XV.

## THE WIELICZKA SALT MINES.

THE GREAT WIELICZKA SALT MINES, THE LARGEST IN THE WORLD. — THEIR HISTORY. — EXTENT AND PRODUCT. — DESCENT INTO AND EXPLORATION OF THEM. — WHAT IS TO BE SEEN. — MINERS AT WORK BLINDFOLDED. — WONDERFUL CHAMBERS. — GLOOM CONVERTED INTO SPLENDOR. — BANQUETS IN THE BOWELS OF THE EARTH. — THE INFERNAL LAKE. — HUMAN DEMONS. — AWFUL APPARITIONS. — EXTRAORDINARY NARRATIVES. . . 211

## XVI.

## CORAL CAVES IN THE PACIFIC.

ISLANDS OF THE PACIFIC OCEAN. — CORAL REEFS, AND THEIR FORMATION. — ROMANTIC STORY OF A CAVERN. — HOW IT WAS DISCOVERED. — AN ELOPEMENT, AND EXERCISE IN DIVING. — LOVE AND TURTLES. — A FEEJEEAN VENUS. — A DISTRACTED FATHER, AND WHAT HE DID. — WAR AND CANNIBALS. — A BATTLE IN THE WATER. — KILLED BY SHARKS. — A MAIDEN'S GRIEF. — THE PERIL OF A LOVER. — VICTORY AND MAGNANIMITY. — SURPRISING A FATHER-IN-LAW. — END OF A SUBMARINE COURTSHIP. — "BLESS YOU, MY CHILDREN, BLESS YOU." . . . 229

## XVII.

## DUNGEONS.

LIFE IN THEM. — ANCIENT DUNGEONS. — THE PRISON OF ST. PAUL. — THE DUCAL PALACE. — "SOTTO PIOMBI." — THE POZZI. — SHUT UP IN THE DARK CELLS. — A NIGHT OF HORROR. — A GUIDE'S BLUNDER. — DUNGEONS OF ST. PETERSBURG. — PETER THE GREAT TORTURING HIS SON. — A PRINCESS DROWNED IN PRISON. . . . . 239

## XVIII.

## I.

### BELOW THE SURFACE.

DIFFUSION OF KNOWLEDGE. — WHAT THE WORLD BELIEVES. — MUNGO PARK IN AFRICA. — WHY THE NATIVES PITIED HIM. — EXTENT OF UNDERGROUND LIFE. — DISTRIBUTION OF THE EARTH'S WEALTH. — VALUE OF MINES. — THEIR EXTENT AND IMPORTANCE. — COAL AND IRON. — MYSTERIES OF MINES. — EXPERIENCE WITH A NOVICE. — CHANGES OF SEASONS TO A MINER. — DANGERS IN MINES. — LIFE IN CAVERNS. — UNDERGROUND IN METAPHOR. — SOCIAL MINING. — OBJECT OF THIS VOLUME.

In these days of fast presses, cheap books and newspapers, lightning telegraphs, and other disseminators of intelligence, there may be those who doubt the correctness of the adage which says, "One half the world does not know how the other half lives." Human nature is inquisitive. We are constantly seeking information regarding the affairs of others, and we generally manage in some way to obtain what we seek. We store our minds with useful and useless knowledge of the manners and customs of people in other lands, and of the private lives and histories of our near neighbors. Very often the material we thus lay aside in our mental storehouses does not particularly concern us, but, like Mrs. Toodles, in her purchase of a door-plate bearing the name of Thompson with a p, we think it will be handy to have at some future day, and so we keep it. With a fair devotion to inquiries, and a well-cultivated memory, a life of threescore and ten years ought, at this day, to acquaint its possessor with a general knowledge of the how and why of the existence of at least half the inhabitants of the globe.

But it may be set down as an axiom, that one half the world does not live as the other half does. People's tastes differ, and there are very few who would wish to live exactly like others, especially if those to whom the choice is offered are richer than the others. There are many who would not change places with their wealthy neighbors, and it is more than probable that their wealthy neighbors would not change places with them. The majority of sailors are not happy when on shore, but are constantly sighing for a wet sheet and a flowing sea, while the majority of landsmen have no desire for such hydropathic experience. When Mungo Park travelled in Africa, the natives expressed great pity for him because he had lost his color; they constantly mourned over the unhappy lot of the white man, and would have been quite unwilling to change complexions with him. Mungo received their sympathy with a countenance becomingly solemn, but the chances are more than even that what they regarded as a misfortune was by him considered a blessing. "Give me a bed of ice and a pillow of snow," said a moribund Laplander in Italy, "and I shall die happy." A refrigerating couch of this kind would be comfortless in the extreme to a countryman of Pauline Borghese.

A comparatively small portion of the human race lives, or would wish to live, beneath the surface of the globe. Most of us rarely go there voluntarily, and our first visits of any important duration are made after we have shuffled off this mortal coil and invoked the aid of the sexton. Then we are carried there without protest, and the earth is filled above us in sufficient depth to guard us against ordinary intrusions. We may be certain that none of our friends will come in living flesh to join us, and when death brings them to our side their slumbers will be as long and peaceful as our own. The earth, beneath its surface, is regarded by many, as the dwelling-place of Death, to be contemplated with a shudder, and to be visited only when life has left us.

But have they ever considered how much of life there is which the light of day does not reveal? The plants in our

gardens have their roots in the rich soil prepared for their sustenance ; remove those roots, and the plants fall and die. The trees of the forest spread their branches and unfold their leaves to sun and storm, but there are other branches spread below which sometimes extend more widely than those above. Through these lower limbs, hidden from the light of the sun and sheltered from the peltings of the pitiless storm, life comes to the trunk and to the upper branches. Lay bare these lower branches, and tear them from the earth, and the tree soon withers and perishes. The grass carpets the meadow, the flowers adorn the hill-sides, wheat and corn grow in the fields, the trees spread their shading limbs and drop their fruits in their season, and without these the world would be desolate. But all have their existence underground, and they cling as tenaciously to the bosom of Mother Earth as the men who walk among or upon them cling to that mysterious element which we call life.

A great portion of the wealth of the globe lies beneath its surface. Gold and silver form the circulating medium of all civilized and many savage people. Their possession is wealth, as the lack of them is poverty ; their coming brings happiness, and their departure leaves misery. From the earth they are taken, and in their pursuit men undergo many privations and suffer many hardships. The diamond that sparkles on delicate fingers has been washed from the accumulations which many centuries had piled above it. Iron, copper, tin, and other metals are sought by the light of the miner's lamp, far away from the rays of the sun, and sometimes in long tunnels pushed beneath the ever-restless ocean. Ages and ages ago the hand of Nature deposited beds of coal in every quarter of the globe, and to-day they afford light and heat to millions of the human race. Down, down, hundreds and thousands of feet below the surface of the earth these coal-beds are spread, sometimes over areas many miles in extent, and promising a supply of fuel for many centuries to come. Thousands of men find profitable employment in these mines ; and but for their labors, those of us who live above the surface would often suffer the pangs of cold.

As the coal burns brightly in our grates and fills our rooms with heat, do we think of the many centuries it has been awaiting our use, and of the toil that has placed it in our control? As we look at the great network of railways, spreading over our continent, bringing north and south, east and west, nearer together, annihilating time and space (and sometimes annihilating people), do we think that but for the mines of coal and iron our country to-day would be little better than it was half a century ago, and much of its area, now rich in commercial and agricultural prosperity, would be little else than a wilderness? To coal and iron the world owes much of its present advancement, and both these substances come from beneath the surface of the earth.

The most valuable minerals, and those which employ the greatest amount of capital, are of comparatively recent exploitation. Iron has done more good to the world than gold, and is many times more valuable; but gold was known and used long before iron was discovered. Coal is more valuable than copper, and gold, and diamonds; the world could go on without these last, as other minerals could take their places, but nothing now known could take the place of coal. From many parts of the globe the forest primeval has been removed, and countries that a few hundred years ago were thickly wooded are now almost denuded of timber. Should the working of coal mines cease to-day, there would speedily ensue a scarcity of fuel, and, if prolonged, this scarcity would result in much suffering and death. The exploitation of coal is one of the great interests of the British Isles, and is of no inconsiderable importance in the United States. More than two thirds of the mining enterprise of the world is devoted to it; yet this substance, possessing no beauty, and to a casual observer devoid of all merit, is included among the most recently discovered minerals. "Time's noblest offspring is its last."

To most people the underground life of the miner is a mystery. Comparatively few of those who walk the earth to-day have ever been farther within it than to the bottom of a cellar; and in many localities even this experience has been denied to

the inhabitants, for the reason that no cellars are found there. If an enumeration were made to-day of all persons in the United States who have ever been underground more than fifty feet from the surface, and more than one hour at a time, the number would be found surprisingly small. I once accompanied a gentleman from Boston in a descent into a mine a hundred feet in depth, and having a single gallery about eighty feet long, leading from the foot of the shaft. It was an old story to me, but a new one to my Boston friend, who clung to the rope of our bucket as convulsively as a drowning man would clutch a life buoy. When we reached the bottom, and crept along the low gallery, his heart beat violently, and he several times wished himself safe above ground. When we finished our exploration, and returned to the upper air, I asked him what he thought of the mine.

"Most wonderful thing I ever saw," he replied. "I never knew much about mines, and didn't suppose they were so deep. Wonderful, certainly."

"What would you think," I asked, "if I should take you into a mine twenty times as deep as this, and having miles of galleries underground, where you could walk a whole day without going through all of them?"

His face assumed the most puzzled expression I ever saw on a human being, and he was speechless for a full minute. When he regained his voice, he said,—

"You might tell me of such a mine, and I should be obliged to believe you, though I can hardly conceive one could be made so large. But as for taking me into such a place, you could never do it without tying me and carrying me there. Catch me in such a place as that, never."

I told him the story of the boy who went from home for the first time in his life to accompany his father to a grist-mill, about three miles away. When the boy returned, he was thoughtful for a long time, and finally remarked that he never supposed the world was so large.

The miner's life is one of vicissitudes and dangers. He is shut out from the light of day, and depends upon his lamp or

candle, instead of the sun and moon. Shut up in the earth, all is night to him; and whether the sun shines or is obscured by clouds, whether the moon is in the heavens, surrounded by twinkling stars, or the whole dome above is wrapped in darkness, makes little difference to him. All is night, and without his artificial light, all is blackest darkness. The changes that follow the earth's daily revolutions are unknown to the miner as he performs his work, and if he remained continually below, the seasons might come and go without his knowledge. Summer's heat and winter's frost do not reach him; there is for him but one season — the season that has endured for millions of years, and may endure for millions of years to come. The temperature of the surrounding earth, unless varied by that of the air driven to him by the machinery of his mine, or by the heat of his lamp, is the temperature in which he performs his labors. Day and night, spring and autumn, new moon and full moon, may come and go, but they extend not their influence to the depths of the mine.

There are dangers from falls of rock and earth, which may cause immediate death, or enclose their victims in a living tomb. There are dangers from water, which may enter suddenly, flood the mine, and drown all who cannot reach the opening in time to escape. There are dangers from the atmosphere, which may become foul, and leave him who breathes it lying dead, far away from those who would gladly assist him, but would lose their lives should they go to his rescue. His light grows dim, and warns him of his peril; as he starts for a place of safety the light goes out, and in blackest darkness he falls and dies, unless speedily rescued. There are dangers from fire, where the atmosphere becomes charged with inflammable gas; it is lighted by an accident, and an explosion follows, in which dozens and sometimes hundreds of men are killed. There are dangers from fire outside the mine, as in the horrible affair of Avondale. There are dangers from the breaking of ropes, and the derangement of machinery, from the carelessness of those whose duty it is to exercise the utmost caution, and from other causes to be hereafter enumerated.

And yet with all these perils there is no lack of men ready to meet them, as there is no lack of men ready to meet the perils and dangers of all branches of industry. Laborers can always be found for any honest employment, and too often for employment quite outside the bounds of honesty.

The earliest life underground was in caves of natural formation. All over the globe there are caverns where men have lived, sometimes under concealment, sometimes for sanitary reasons, and sometimes because they saved the labor of constructing houses. Some of these caverns are of great dimensions, and could furnish shelter for thousands of men, while others are adapted to the wants of only a few persons. Many caverns and caves are not available as dwelling-places, but are visited only from motives of curiosity on the part of travellers, or from a desire for gain on the part of those who seek whatever may be valuable. Many caves have histories romantic or tragic, and some of them combine romance and tragedy in about equal proportions. Tales of love and war, of fidelity and treachery, and of all the contending passions and experiences of human nature, can be found in the histories of these excavations which have been made by no mortal hands.

Metaphorically, there is a great deal of underground life above the surface of the earth. Men devote time, and patience, and study to the acquisition of wealth by measures that are as far removed from the light of honesty as the tunnel the miner drives beneath the mountain is removed from the light of the sun. One builds a reputation which another burrows beneath and destroys, as the engineers at Hell Gate undertook to destroy the rocky reef which sunk the ships of many a navigator, from the days of Hendrick Hudson to the present. Hope springs eternal in the human breast, but it is not always hope for better things.

Dishonest men hope for wealth, they care not how obtained, and in its pursuit they frequently imitate the labors of the miner. Shafts are sunk and tunnels are driven; the pick, the drill, and the powder-blast perform their work; operations are

silently and secretly conducted, and all unknown to the outer world; dangers of falls of earth, of floods of water, of choke-damp, and fire-damp, are unheeded, and by and by the prize may be obtained. A great city, in its moral or immoral life, is cut and seamed with subterranean excavations more extensive than those of the richest coal-fields of England or Belgium. Wall Street is a mining centre greater than the whole of Pennsylvania, and to one who knows it intimately it reveals daily more shafts and tunnels than can be found in Nevada or Colorado. The career of a politician is not unlike that of the miner, though it is frequently much more difficult to follow. The miner may be tracked and found, but there is many a politician whose devious windings would baffle the keenest detective that ever lived.

To describe underground life in its many phases is the object of this volume. The experience of the miner is full of adventures of an exciting character; so exciting, indeed, that there is no occasion to use fiction in place of fact. The hardships, the difficulties, and the dangers that surround him who labors beneath the earth's surface might form the basis of a story more interesting than the most skilfully constructed romance ever printed. It is an old adage, that Truth is stranger than Fiction: the experience of the miner affords better illustrations of the correctness of this adage than does that of any other laborer. Especially is this the case if we consider Underground Life in its metaphoric as well as in its literal sense, and note the devious and hidden ways in which many of our fellow-men pass the greater part of their existence.

AUSTIN, NEVADA, A WESTERN MINING TOWN.

## II.

### DISCOVERY OF COAL.

SAVAGE THEORIES ABOUT COAL. — EXPERIENCE OF A SIBERIAN EXPLORING PARTY. — BURNING BLACK STONES. — MINERAL FUEL AMONG THE ANCIENTS. — THEIR MOTIVE POWER. — CHINESE TRADITIONS. — CHINESE GAS WELLS. — HISTORY OF COAL IN ENGLAND. — A ROYAL EDICT. — CURIOUS STORY OF THE MINER OF PLENEVAUX. — EXTENT OF COAL FIELDS THROUGHOUT THE GLOBE. — THE QUAKER AND THE YANKEE PEDLER. — THE FIRST ANTHRACITE. — BELLINGHAM BAY AND THE CHINOOKS. — HOW COAL WAS FORMED. — INTERVIEWING A REPTILE. — THEORIES OF THE ANCIENTS. — RIVERS OF OIL OF VITRIOL. — ANCIENT AND MODERN FIRE WORSHIPPERS.

IN the autumn of 1865, a small party connected with the survey of a telegraph route through North-eastern Asia, was landed at the mouth of the Anadyr River, near Behring's Straits. Another party was landed in Kamchatka, and proceeded over land towards the north. They made constant inquiries about the Anadyr party, and at last learned from a band of wandering aboriginals that some white men had been left by a fire ship (steamer) near the mouth of the river, and were living in a small house which they had constructed partly of boards, partly of bushes, and partly of earth. The savages described them as the most wonderful white men they had ever seen. "They have," said one of the savages, "an iron box, and they burn black stones in it to make a fire." These savages had never seen a stove, and they had never seen coal. To their untutored minds the work of the white men was something wonderful.

It is probable that the comparatively recent discovery of mineral coal is due in a great measure to its close resemblance to stone. A savage or civilized man knows that an ordinary stone, whether white, red, blue, green, or gray, will not burn; then why should he suppose that a black stone

will burn? Until a comparatively recent date there has been no great demand for coal as fuel. Many parts of the world at the present day are covered with immense forests, and for a hundred and perhaps thousands of years there will be no occasion in these localities to make use of the mineral fuel.

It is supposed that the Greeks and Romans had some knowledge of fossil fuel, but they made very little use of it, partly for the reason that they did not know the proper way to burn it, and partly because the forests in those days furnished all the fuel needed for industrial purposes. There were no manufactories and smelting establishments, and the working of metals was carried on in a very primitive way. Wood and charcoal were the only fuel, and most of the countries inhabited at that early day were favored with a warm climate, that for the most part of the year was comfortable enough by day, while blankets and other bed-clothing gave sufficient warmth by night. The laws of heat were not known; the pressure of vapor was not even thought of, or suspected; and mechanical force was derived from wind, from water, and from animated beings.

When the winds did not blow the galleys were rowed by convicts, and in the absence of a stream of water, animals, and sometimes men, turned the mill.

Occasionally in building aqueducts, large beds of coal were laid bare, but no attention was paid to them. In making one aqueduct, a branch of a canal was cut through a bed of rock, and at the bottom of that bed a valuable seam of coal was found, but nobody appears to have troubled his head about it. It is supposed by most writers that the discovery of coal occurred in the East. The Chinese have been credited with the discovery and invention of nearly everything in the world except the discovery of America and the invention of the electric telegraph. It is pretty certain that they were acquainted with mineral fuel from a very remote antiquity. They knew how to work it, and apply it to industrial uses, such as baking porcelain, drying tea, and the like. The Chinese, for hundreds of years, used to bake porcelain with

mineral coal. It is only recently that mineral coal has been substituted for charcoal for this very same purpose in France, and it has been found to be quite economical.

The Chinese knew how to collect the gases which came from coal, and they used them for illuminating. The accounts of the early missionaries state that from time immemorial the Chinese used to bore into the earth in search of gas, and when they found it they conveyed it in pipes to the places where it was wanted. Gas was not used for illuminating in Europe until quite recently.

Historians also say that for many centuries mines of coal have been worked in the Celestial Empire, but that the working was in a very barbarous fashion. Many of their coal mines consist of open cuttings; when they went underground they took but little care to construct drains or support the subterranean ways, and they took no precaution whatever against explosions of fire-damp, which often proved fatal. Their working of mines to-day is in the same barbarous fashion of centuries ago, and one might be pardoned for thinking, like the boy who was trying to learn the alphabet, that it was hardly worth while to go through so much to accomplish so little.

In England there are evidences to show that coal was known to the Romans, and possibly to the Britons before the Roman invasion; but it was only worked at the outcrops of the coal seams. No mention is made of coal until the time of Henry II. In 1259 a charter was granted to the Freemen of Newcastle, giving them the liberty "to dig for cole," and a few years later coal was carried to London.

In 1306 Parliament petitioned the king to prevent the importation of coal, and Edward I. issued a proclamation forbidding the use of mineral fuel. Coal was worked to some extent in the thirteenth, fourteenth, fifteenth, and sixteenth centuries, and by the beginning of the seventeenth century the English coal mines were in full operation. In 1615 four thousand English ships were employed in the coal trade. The coal mines of Belgium were opened about the

same time as those of England. The Belgian coal miners tell a curious story of the discovery of coal, in the twelfth century, at the village of Plenevaux, near Liege. One of the old chroniclers gives the account as follows:—

“Houillos, a farrier, at Plenevaux, was so poor as not to be able to earn enough for his wants, not having sometimes bread enough to give to his wife and children. One day, being without work, he almost made up his mind to put an end to his life, when an old man, with a white beard, entered his shop. They entered into conversation. Houillos told him his troubles; that, being a disciple of St. Eloi, he worked in iron, blowing the bellows himself to save the expense of an assistant. He could easily realize some advantages if charcoal was not so dear, as it was that which ruined him.

“The good old man was moved even to tears. ‘My friend,’ said he to the farrier, ‘go to the neighboring mountain, dig up the ground, and you will find a black earth suitable for the forge.’

“No sooner said than done. Houillos went to the spot pointed out, found the earth as predicted, and having thrown it into the fire, proceeded to forge a horseshoe at one heating. Transported with joy, he would not keep the precious discovery to himself, but communicated it to his neighbors, and even to his brother farriers. A grateful posterity has bestowed his name to coal, which is called, in French, *Houille*.

“His memory is still cherished by all the miners of Liege, who frequently tell the story of the honest collier, or of the old coal miner, as they delight in calling him. The miners say it was an angel who showed him the spot where the coal was.”

It is not positively known when the first discovery of coal was made in the United States. Some historians say that it was before the Revolutionary war, while others say it was since that time. It is certain that coal mining has not been extensively prosecuted on the American continent until within the past fifty years.

There is an old story told somewhere of a discovery of coal in

IMPRESSIONS OF PLANTS FOUND IN COAL.

DISCOVERY OF ANTHRACITE COAL IN PENNSYLVANIA.

Pennsylvania by one of the Quaker settlers in the mountains, not far from where Scranton now stands. According to the story-teller, — but I cannot vouch for his correctness, — the Quaker settler, who was familiar with coal in England, discovered a peculiar stone, which seemed to him almost identical with the substance which he had used in England for fuel. He carried some of it home, and threw it in the fire. He found that it became red, and was consumed, but that it would only ignite when there was a very hot fire of wood around it. The coal with which he had been familiar would burn quite readily, and gave off a thick black smoke; but the substance which he had discovered gave neither smoke nor flame. He wondered at this, and concluded that the substance which he found was worthless.

One day a traveller, whom the story-teller converts into a Yankee pedler, came along. As they sat by the evening fire, the Quaker told him of the peculiar region they were in, and of the remarkable stones which he had discovered. He threw a few fragments upon the fire, and in a little while they became red and were consumed.

The traveller insisted that the substance was valuable; that it was probably good coal, but the great difficulty was to make it burn. After gossiping a while about the matter, the traveller went to bed.

During the night he pondered over the matter, and in the morning asked his Quaker friend to take him to the spot where he had found the black stone. The spot was shown him; he examined the substance carefully. The Quaker carried to the house a considerable quantity of the substance, and then the Yankee said, —

“I think we can make this stuff burn if we can only draw a fire through it. Now, what we want to do is to fix up something so as to make the fire go where we want it to.”

The Quaker assented to the proposition, and asked if it were possible.

The Yankee said, “Yes. I know how it can be done; but before I tell you I want to buy half of the land where you found that stone.”

A bargain was struck very speedily, and the Yankee hunted around the establishment, and found a piece of sheet iron, which he fashioned into a blower. He then built up a small, narrow fireplace, and fitted his blower to the front. "The next thing," said he, "is to make something like a grate;" and they took some rods of iron and fashioned them into a rude grate.

"Now," said the Yankee to the Quaker, "build a good fire of wood, so that it will fill the bottom of that grate."

The Quaker followed the directions, and when the fire was well started, the Yankee threw a peck or so of the coal on the top and put up the blower. The fire was drawn directly among the fragments of coal; in a little while the blower was removed, and the coal was found to be a red, burning mass, which threw off an intense heat.

Both were delighted with the discovery; and thus was opened the first anthracite coal mine in America.

A story was once told to me, on the Pacific coast, concerning the discovery of coal at Bellingham Bay, in British Columbia. The narrator said that a party of men connected with the Hudson Bay Company's service, was at one time in the camp of a family of Chinook Indians. The Indians told them that a few days before, in a locality which they had visited, they had attempted to build a fire. The wind was blowing, and in order to shield their fire they piled some stones around it. Among these were two or three large black stones, which they had picked up on the surface. Great was their astonishment, when the fire was under way, to see these black stones ignite and burn. They thought it something mysterious, and immediately ascribed it to the work of the devil, just as a great many savage and civilized people are inclined to attribute anything they do not understand to His Satanic Majesty. Next day they guided the white men to the spot. It was found that a vein of coal outcropped upon the surface, and gave sure indications of a rich deposit below.

The annual production of coal throughout the entire world

is roughly estimated at about two hundred millions of tons. More than half of this coal is produced in Great Britain. About twenty millions of tons are mined in North America, and the rest mainly in Belgium, France, and Prussia. The production of other countries is comparatively insignificant. Coal is the most valuable mineral substance known. The amount of coal taken from the earth every year is double the value of all the gold, silver, and diamonds annually produced. In the great World's Fair of London in 1851, when the famous Kohinoor diamond attracted thousands of curious spectators, there was one day a lump of coal placed near the case containing the Kohinoor. The lump bore this brief label: "This is the *real* Kohinoor diamond."

America to-day is of far less importance as a coal producer than Great Britain, but she is destined to become eventually the great coal producer of the world. At the present time there is much anxiety in England about the exhaustion in a few hundred years of the coal fields in the British Isles. The United Kingdom contains nine thousand square miles of coal fields; France, Belgium, Spain, Prussia, and other German states, together, about two thousand seven hundred square miles of coal fields; other countries, not including America, contain about twenty-nine thousand, while North America, including the British colonies, contains about one hundred and eighty thousand square miles of coal fields. It will thus be seen that the area of the North American coal fields is four times as great as all those of the other countries of the globe. Of this immense extent of coal deposits, a very small portion has yet been touched, and consequently for thousands of years to come our country can supply the world.

Coal was formed at a very remote geological period. Scientific men differ as to the exact age of this substance, Their differences are trivial, however, being only a few millions of years; but they all agree that at the time coal was formed there were wide jungles and swamps that covered a large portion of the earth's surface. The atmosphere was very moist, and probably contained a much larger proportion of

carbonic acid than at the present time. This gas is one which especially promotes the growth of plants. It is, and was, probably unfavorable to the existence of animal life; and it has been suggested that the gradual withdrawal of the carbonic acid by the growth of vegetation of that period slowly purified the atmosphere, and brought it to the condition in which we now find it. The earth at that time was not fitted for the habitation of man. If man had existed at that period, he would have needed fins in the place of hands and feet, and would have required lungs like those of fishes, instead of those which he now possesses. There was an abundant population of reptiles and of insects, and there was a liberal supply of fishes.

Many of these fishes, reptiles, and insects are unknown at the present day. They performed their work, if work they had to do, and disappeared. Their remains are found in the coal seams and in the rocks which lie above or beneath the coal, and form an interesting subject of study.

Some of the reptiles were enormously large. Remains have been found of a lizard more than one hundred feet long, with an open countenance, that could have taken in an ordinary man about as easily as a chicken swallows a fly. The skeletons of these reptiles are found, and I think that most people who examine these skeletons are inclined to give a sigh of relief when they remember that such creatures are now extinct. They would be very disagreeable travelling companions, and one might be very much disinclined to meet them in a narrow lane on a dark night.

Some years ago I examined the skeleton of a reptile discovered in the Mississippi Valley, and though the bones were cold and motionless, I had the wish to keep at a respectful distance from them. He had a mouth that reminded one of the extension top of a patent carriage; and when his jaw was pushed back, it seemed to me that he could have walked down his own throat without the slightest difficulty.

The most plausible and reasonable theory of the formation of coal seems to be that it is for the most part the remains of vegetable matter which had become decomposed and changed

to mineral on the spot where it remained and is now found. The fibrous tissues of the aquatic vegetation flourished like a thick carpet on the moist surface. It became mingled and matted together, as we now find turf and peat in peat bogs, and in swamps and marshes. On the borders of great lakes, which in time were built up and became swamps, these plains extended, and underwent slow depression. Layers of sand and other substances were carried down below the level of the sea, which we now find among and alternating with the coal seams in the shape of beds of shales and sandstones. Then another system of lagoons formed above them, and allowed new jungles to spring up and new marshes to be formed. These were in turn depressed and covered by the waters. In this way, step by step, the coal beds were built up. According to geologists, each coal seam represents a depressed swamp, while the intervening strata of sandstone, and shale, and clay, mark the various sediments which were brought together by the action of the waters.

The coal beds contain many impressions of plants and portions of plants, so that geologists have been able to determine the nature of the vegetation of that period. There are a great many mosses and ferns, some of the latter having thick, broad stems, and long and heavy leaves. One geologist says there are one hundred and seventy-seven specimens of plants found in single coal beds. He says there are no palms, nor grasses, nor flowering plants; and for this reason he considers that the coal beds were formed from plants of a marshy growth.

The layers of peat, after being covered by shales, sandstone, and limestone, were compressed beneath the enormous weight of the over-lying strata, and while undergoing this compression, there was a sort of distillation and purifying process going on. In this way the plants and peat, originally loosely matted together, became more and more compressed, and by means of the heat and pressure were entirely decomposed. Ultimately the substance was turned into what we now find it, and the coal was stored up for future ages.

The ancients had curious theories in regard to the forma-

tion of coal. They regarded it as streams of bitumen, which had become petrified, or had impregnated certain very porous kinds of rock. Another theory which they entertained was, that forests had been carbonized on the spot where they grew, or had been transformed by streams of sulphurous acid, which possesses the property of hardening and carbonizing wood. It is easy to attribute the origin of coal to the agency of rivers of bitumen, and oil of vitriol; but it is not easy to say where those rivers came from.

The Chinese have a theory that coal is a species of plant of which the seed was deposited in the earth ages and ages ago, and that it grew and spread in different parts of the empire where it is now found, in order that the Chinese of to-day might have a sufficient supply of fuel. They attribute the streams of inflammable gas, which they collect and utilize, to the breathings of an immense monster below the surface of the earth, and in some localities they call him the first cousin of the God of Fire. The God of Fire is one of the Chinese deities. He occupies a prominent place in the temples, and is worshipped with great solemnity. In other parts of the world these streams of gas are worshipped, and in localities along the coast of the Caspian Sea, streams of burning gas are constantly rising, and their sources are known as sacred wells. They are visited by thousands of devotees every year, and are regarded with the greatest reverence.

Wells of similar character exist in the United States, but they are mostly of artificial origin. They are found in the vicinity of Oil Creek, and that region of Western Pennsylvania which has been baptized as Petrolia. Thousands of American devotees can be found in the vicinity of these wells, and many of them owe their fortunes to the modern God of Fire; but it is doubtful if many of them worship the wells with that religious devotion and reverence which are found among the fire worshippers of the far east.

### III.

#### THE CAVERNS OF NAPLES.

EXCAVATIONS NEAR NAPLES. — POZZUOLI. — VISIT TO THE CAVE OF THE CUMEAN SIBYL. — ACCIDENT TO AN ENGLISH TRAVELLER. — HUMAN PACK-HORSES. — DARKNESS AND TORCHES. — THE LAKE OF AVERNUS. — DROWNED IN BOILING WATER. — A DANGEROUS WALK. — IN NERO'S PRISON. — INSTRUMENTS OF TORTURE. — USE OF THE RACK. — THE IRON BEDSTEAD. — BROILING A MAN ALIVE. — TREATMENT OF PRISONERS. — AN ANCIENT FUNERAL. — VIRGIL'S TOMB. — CONSTRUCTING WINE CELLARS. — NOVEL PLAN OF ROBBERY.

THE traveller who visits Naples has abundant opportunities for making underground explorations in the neighborhood of that city. A few of the places he can examine are of natural origin—the Blue Grotto, for example; but by far the greater part of them are artificial. A most interesting journey can be made to Pozzuoli and its immediate neighborhood. With a longing desire to see some of the underground curiosities that have made that part of Italy famous, I arranged a tour in that direction before I had fairly settled myself at the hotel. We made a party of three, all Americans, and all as impatient and uneasy as our race is said to be when travelling on the continent. A skirmish with a horde of rapacious coachmen secured us a carriage, and we drove out of Naples by the road which skirts the bay in the direction of Rome.

Arriving in the vicinity of the famous places, we were beset by guides, who almost climbed into the carriage in their eagerness to secure an engagement. We picked out the cleanest of the lot, or rather the least dirty, and mounted him upon the box by the side of the driver, where he sat in all the dignity of an emperor. He spoke a confused jumble of English, French, and Italian, which was no language in particular, but might be anything in general. His first move-

ment was to stop at a wayside house, from which a woman emerged bringing us half a dozen candles or torches of twisted rags and tallow, each of them as large as one's wrist, and about three feet long. We objected to so many, but the guide assured us they would all be needed. I was inclined to doubt his statement, from my knowledge of the rascality of guides in general; but he met me with the promise, "Me them will pay for if not they be wanted, Si, signor. You verrez will."

Of course we could not refuse after this guarantee. I paid for the torches with a silent resolution to make the fellow eat what were left over; and, as the tallow was bad, and the rags were worse, there was good reason to believe they would not make an agreeable dinner.

Soon after making this purchase, the work of sight-seeing began. Each place we visited had a man at the entrance, and not one of us could go inside without paying for the privilege. There were always a half dozen idle fellows hanging about ready to sell cameos and other curiosities which had been dug up in the vicinity, as they solemnly avowed; in reality the cameos were of modern manufacture, and made in Rome or Naples. The speculators would begin by asking fifty francs for a cameo which was worth about five, and which they would sell for five if they could not get any more. If we safely ran the gantlet through these avaricious tradesmen, we were beset by local guides who wanted to lead us, and we generally found it desirable to employ some of them in order to see what the place contained. In one instance these guides acted as pack-horses, and I can testify that one of them, at least, had all that he wanted to carry; and this is the way it happened.

At the cave of the Cumean Sibyl, where the Emperor Nero and other famous men of the olden time were accustomed to go to hear the prophecies on which their fate depended, we found a larger crowd than usual. A party of Americans were just emerging as we entered, and one of them intimated that the place laid over anything he had yet seen. Our torches

**BAY OF NAPLES.**

**NAPLES WAGON.**

were lighted, and we went forward quite a distance, through a tunnel eight or ten feet wide, out of which a smaller tunnel descended. Down this tunnel we walked until we came to the edge of a black, repulsive pool, over which the light shone very dimly. There was considerable smoke hanging over the water, and altogether the place was about as gloomy as anything I had ever seen. For all that could be discovered, the pool might be a thousand feet deep, and any number of miles across; to venture upon it might be like venturing upon the Atlantic Ocean, or any other great body of water. I noticed that the guides had their trousers rolled to the knee, and were barefooted. They fearlessly entered the water; two of them carried the torches, and three others backed themselves to the edge where there was a sort of stepping-stone.

"What is to be done now?" we asked of our private guide.

"Montez ze backs ze men of," he replied. "You they carry porteez will to Grotto del Sibyl."

We hesitated to trust ourselves with these fellows, who might drown us, or throw us into a hole a few thousand feet deep, and leave us to come up again through the crater of Mount Vesuvius. But finally we concluded to try it, and so we mounted our two-legged steeds and rode off.

It happened that I was the heaviest of our party, and it also happened that the man who took me did not weigh as much as I did by at least fifty pounds. He trembled beneath me like a plateful of jelly in the hands of an intoxicated waiter, and I expected every moment he would drop me into the water. We went out from the shore into the smoky darkness, and in less than a minute we were completely at sea. Water was beneath and around us, and there was a black sky above that we could almost touch. No horizon was visible, and altogether we seemed to be in a world about ten feet in diameter, and without sun, moon, or stars.

Our porters splashed along in water about two feet deep, and I thought much more of the liability of my pack animal to stumble than I did of the Cumean Sibyl and her oracles.

Nero was less in my mind than the garlic-eating Italian beneath me, and I was much less interested in the Roman kings than in a certain subject of Victor Emanuel. Our trio exchanged comments on this novel mode of travelling, and for the time we had very little appreciation of the wonderful history of Rome and her dependencies.

As near as my recollection serves, we had about five minutes of this sort of travel, when the head of our procession came to a halt before a recess in the wall, which our leader described as the Sibyl's Bath. It seems that before delivering her oracles, she used to take a bath, on the principle, doubtless, that cleanliness is next to godliness, and the purer her skin the more likely would the gods be to aid her with their inspiration. The artists represent her as a pretty woman, and of course she was well aware that frequent bathing had a tendency to preserve her good looks.

The couch or bench where she reclined when delivering her oracles was pointed out, and as it then appeared, it was anything but comfortable. The presence of the water in the cave was explained to be something modern, and not at all in fashion when the Sibyl used to be at home to visitors of wealth and distinction. She used to keep her floor dry and well swept, and probably she had a little sideboard with a cold ham or two and a bottle of wine. Nero was a frequent caller, both in fashionable and unfashionable hours, and used to send her valuable presents. Mrs. Nero was jealous, but the old gentleman was in a position to do pretty much as he liked, and didn't mind her scolding. One of my companions showed me a scrap of paper, which he said he found just inside the entrance to the cave, while I was paying off the guides. It ran as follows:—

May 10, 4 P. M.

DEAREST SIB: Expect me at eight. The old lady is going out this evening, and won't miss me. Have the tea ready, and send out for a bottle of Cliquot. I will bring a mince pie and some Limburger cheese; also a new pair of ear-rings and a chignon.

Your loving

NERO.

I suspected that the note was a forgery, as it was written in English, and the paper had the water-mark of 1866. I called my friend's attention to these slight discrepancies, and he at once put the paper in his pocket, and said nothing more about it.

After looking at the couch of the Sibyl we started back to our landing-place. Just as we neared it we met another party going in. One of the porters of the new party was evidently weak in the knees, for he stumbled just as he passed me, and went down like a handful of mud. The gentleman he carried was dropped into the water, and fell flat, as though intending to take a swim. He slowly rose to his feet, and after blowing the water from his mouth with a noise like the spouting of a whale, he ventured several remarks that were nowise complimentary to his porter or to the place. He appeared somewhat excited. His language showed him to be English, but there was nothing in it to indicate that he was a member in good and regular standing of the Church of England. He did not finish his journey to the bath and couch of the Sibyl, but followed us to the shore, where he wrung himself out, and then retired to his carriage to be hung up to dry. With a heartlessness peculiar to many travellers, he refused to pay the porter for his services. It is fortunate that the latter did not understand English, as he would have been offended at the remarks which were made about him.

From the Sibyl's Cave we went to the famous Lake of Avernus, which was described by Virgil long before anybody who reads this book was familiar with a single word of Latin. Near the lake is the famous passage into the mountain about which Virgil wrote:—

*"Facilis descensus Averni. Sed revocare gradum, hic opus, hic labor est."*

We paid our admission fee, and then prepared according to the directions of the guide. We laid aside our coats and vests, removed our collars, neck-ties, and hats, and altogether put ourselves in a condition quite improper in polite society. A boy stood ready to precede us in a costume consisting of a pair

of pantaloons and a tin pail. A fresh egg was now shown us, and we examined it to see that it was quite cold and raw. The boy then took the egg and a torch, and went into a tunnel like the one at the Sibyl's Cave. A blast of hot air met us at the entrance, as though it came from a furnace, and I thought of Nebuchadnezzar and the treat that he used to have for his visitors. On and on we went, and also down and down. Old Virgil was right when he said that the descent was easy, for we went down with the grace of so many oysters entering the mouth of a champagne bottle. Hotter and hotter grew the air, and before we were half way down I remembered some business that I had neglected when I left America. I wanted to go back to look after it, but my friends argued that it would keep a little longer, and I had better go on. So we continued down into the bowels of the mountain, over a slippery pathway and in a temperature as agreeable as that of the stoker's room on a steamship.

We reached the end at last, and the boy stooped to the edge of a pool of water and placed the egg within it. We could see a thin vapor rising from the surface, and readily imagined that it was steam. The boy was careful of his hands, more careful than was necessary, since he might have added to the interest of the occasion by scalding them, and then hiring another boy to take his place. There were plenty of boys outside who could be hired cheap, and if a dozen were killed daily by scalding, or rendered helpless, it would have made no serious diminution of the Italian population.

We stood there a couple of minutes, and then the boy took the tin pail and scooped up the egg and a quart or two of water. He then started back, and scrambled quite nimbly up the steep and slippery path. It was a difficult ascent to make, and we acknowledged that Virgil's head was level when he told about the labor required to retrace one's steps from Avernus. We perspired like a man who has just learned that he is the father of triplets, and by the time we completed the journey, our clothing was pretty thoroughly saturated. The boy was accustomed to it, as the old lady's eels were to being skinned,

and the hide on his shirtless back looked like the outside of a long-used pocket-book. The egg was thoroughly cooked, and the water in the pail was of a scalding temperature, altogether too hot to put one's hand into. The egg cost us half a franc, and so did the boy: one of us ate the egg with a little salt, but we declined to eat the boy with or without salt, and he did not urge us.

The guide told us that one day an Englishman went down the "descensus Averni," and on arriving at the hot water, he stepped around so carelessly that he slipped and fell in. His cries and shrieks rang through the tunnel; he was pulled out as quickly as possible, but he was so badly scalded that he died in a few hours. Several accidents have happened there by persons scalding their hands and feet, but the character of the place is such, that people are likely to be careful; otherwise there would be frequent casualties to record.

We visited the ruins of temples that were erected to I don't know how many deities, and the next subterranean exploration that we made was at Nero's Prison, as the guide and the guide-books call it. We left our carriage and went on foot up a narrow lane, and along a path where beggars followed and beset us at every turn; notwithstanding their importunity, they did not extract any money from us, though they appeared in all the conditions in which beggars could possibly present themselves. Nero must have been a charming personage if one could judge of him by looking at the place where he used to shut up those who offended him. It was a subterranean affair, and we were obliged to light our torches to explore it. We were led through winding passages into cells that were anything but comfortable, the guide stopping every moment to explain to us the nature of each one of the cells, and the uses to which they were put. They were small enough to render it utterly improbable that a man would exert his legs very actively in running, after he was once shut in, and as for light and ventilation, they were quite in keeping with the size of the apartments.

I inquired about the character of the food which Nero used

to furnish to the occupants of his boarding-house, and was told that it was not of a luxurious character. Nero had no *table d'hôte*, but used to send the meals to the rooms of his guests. None of them are alive now, and their early death is to be attributed in many cases to the treatment they received. At the time they resided there, oysters had not been invented, and there is nothing on record to show that the delicious conglomerate which we call hash had made its appearance. Some of the patrons used to express a desire to live on the European plan, and take their meals outside ; but the proprietor would never permit it. And it must be said, to his credit, that his establishment was to a certain extent a free lunch concern, as he never charged anything for board and lodging. Everything was gratis, and of course the patrons who complained must have been mean fellows, who couldn't be satisfied, no matter what you might do for them.

The furniture of the place was very simple. It had been mostly removed when we were there, but it consisted originally of a bundle of straw on the ground and a double lock on the door. There used to be a gymnasium, where they kept a choice lot of racks, thumb-screws, and other luxurious arrangements. Life in the private rooms used to be monotonous, and in order to render it interesting, Nero would take his patrons into the gymnasium to amuse them. Some of them he would play a joke upon by tying them down on a rack and then winding up the machine so that a man of five feet eight would often be converted into six feet two. When he had been played with in this way, they would turn him loose, though releasing him did no good, as he was generally dead before they let him off.

The gymnasium had another arrangement, patented by Mr. Procrustes, which was intended to equalize all men, and make them of a uniform height. This invention, based on the principles of mechanical communism, was a bedstead of iron, and there were various individuals who enjoyed the treat of being placed upon it. A poet has alluded to it as follows : —

NERO'S GYMNAZIUM.

"This iron bedstead they do fetch  
To try our hopes upon.  
If we're too short we must be stretched,  
Cut off if we're too long."

When they laid out a man on this couch, if its length corresponded with his, he was immediately removed before he had time to go to sleep. If he was short, both in money and in stature, they elongated him until he could touch headboard and footboard at the same time; and if he was a tall fellow, they shortened him at the feet with a large pair of shears that were kept for the purpose. When a hundred men had been measured on this bed and placed in a row, they were found to be of the same elevation. A good many of them died soon afterwards, but people were numerous in those days, and the dead ones were not missed by those who didn't know anything about them.

Down in the kitchen, Nero had a gridiron resembling a garden gate, or a section of an iron fence. He had so many cooks that all of them could not be constantly employed, and so he busied himself to devise ways to employ them. He found that the gridiron was just the thing, and when his cooks were idle he used to take one of his lodgers down stairs and promise him a good roast. The lodger would be thinking of a nice turkey or a leg of mutton when Nero said "roast" to him, and as the private table was not very good, he was always ready to go below. When they got down stairs Nero would tip the wink to the cooks, who would seize the lodger and tie him on the gridiron. They then built a fire under him, and Nero carried on the joke by standing alongside with a big ladle and pouring hot oil over his guest. When he was done brown, and turned over and done on the other side, they would let him off to enjoy the fun of seeing the sell played on the next man. No doubt he would have enjoyed it had he not been dead long before they got through with him.

When we returned to Naples, we went by another route than the one we had taken in the morning. At one place our way led through a tunnel cut into the solid earth, and said to

be more than two thousand years old. It has worn down greatly since it was first opened ; the marks of the axles of carts and wagons are visible along its sides ten or twelve feet above the present floor. It is lighted by torches placed at regular intervals along the walls, and is an important thoroughfare for people going between Naples and certain villages and towns to the north of it. At the end nearest to Naples we were taken to what is supposed to be the Tomb of Virgil, though its authenticity is considerably in doubt. It certainly is not much of a tomb, and many a man not half so talented or famous as Virgil has been lodged after death in far more beautiful quarters than these.

The peculiar nature of the earth composing the hills around Naples has greatly facilitated the construction of tunnels and caves. It is almost identical with that of the bluffs of Vicksburg — easy to cut, and at the same time sufficiently firm to prevent falling in. No roofing or arching of any kind is needed, and the tools ordinarily used in excavations are all that are required. Consequently every man who has a hill on his farm can construct a spacious wine cellar at little expense ; and if he has a friendly neighbor over the hill, they can easily cut their way through, and save the trouble of climbing when they want to visit each other.

I heard of Neapolitan thieves who sometimes find out a well-stored wine cellar in the side of a small hill, and carefully observe its position. Then they erect a small house on the other side, and begin a small tunnel. They cart the dirt away at night, and after a month or so enter the cellar and steal enough wine to pay them handsomely for their trouble.

## IV.

### OPERATIONS AT HELLGATE.

HELLGATE AND SANDY HOOK. — ENTRANCES TO NEW YORK HARBOR. — THE HELLEGAT AND ITS MEANING. — STORIES OF THE OLD VOYAGERS. — EDITORIAL JOKES. — MAILLEFERT'S OPERATIONS. — DEEPENING THE CHANNEL. — GENERAL NEWTON. — THE AUTHOR ON AN EXCURSION. — BLOWING UP COENTIES' REEF. — HOW IT IS DONE. — AN ACCIDENT WITH NITRO-GLYCERINE. — THE AUTHOR'S NARROW ESCAPE. — DIVER'S EXPERIENCE. — ASTONISHING THE FISHES. — RECEPTION AT HALLETT'S POINT. — GOING UNDER THE REEF. — THE MEN AT WORK. — AN INUNDATION. — HOW THE REEF IS TO BE REMOVED. — SURVEYING IN THE WATER. — A GRAND EXPLOSION.

FROM the Atlantic Ocean there are two entrances into the harbor of New York; one by way of Sandy Hook, and the other through Long Island Sound and the East River. For a steamer coming from Liverpool, the nearest entrance is through Long Island Sound. The Sandy Hook entrance is obstructed by sand bars; the channel is tortuous, and accidents are not uncommon. The entrance to Long Island Sound is broad and easy, but between the Sound and the East River there is a very dangerous passage, which extends, however, less than a mile. This dangerous passage is popularly known as Hellgate; the early Dutch navigators gave the place its name. Tradition says that a Dutch skipper, named Adrian Blok, called it the *Hellegat Riviere*, after a small stream in Flanders, the place of his nativity. There is nothing sulphurous in the name, Hellegat, which is said, by one writer, to mean "Beautiful Pass;" somehow, the transposition of the word into Hellgate, has given it an infernal aspect.

The early historians of Manhattan and its vicinity described the Hellegat as a very dangerous place; one of the earliest writers speaks of it as follows: "which being a narrow passage, there runneth a violent stream both upon flood

and ebb, and in the middle lyeth some islands of rocks, which the current sets so violently upon, that it threatens present shipwreck; and upon the flood is a large whirlpool, which continually sends forth a hideous roaring, enough to affright any stranger from passing that way, and to wait for some Charon to conduct him through, yet to those who are well acquainted, little or no danger; yet a place of great defence against any enemy coming in that way, which a small fortification would absolutely prevent."

Washington Irving humorously says of it, "At low water it is as pacific a stream as you would wish to see. But as the tide rises it begins to fret; at half tide it roars with might and main, like a bull bellowing for more drink; but when the tide is full it relapses into quiet, and for a time sleeps as soundly as an alderman after dinner. In fact, it may be compared to a quarrelsome toper, who is a peaceable fellow enough when he has no liquor at all, or when he has a skinful, but who, when half-seas over, plays the very devil."

Occasionally, certain witty editors of New York and Boston engage in little wordy contests in regard to the improvement of Hellgate: a Boston editor will say the widening and deepening of Hellgate will improve the entrance to New York! An editor of Manhattan Island will respond that the widening and deepening of Hellgate improves the road to Boston. Neither seems inclined to admit the existence of as much immorality in his own city as in the abiding-place of the other.

The removal of the rocks that lie in this passage between East River and Long Island Sound has been a subject of great anxiety with merchants of New York, and it seems a little strange that from the time of the settlement of New York until less than thirty years ago, very little had been done towards this work.

As late as 1845, the channel had not even been surveyed; and it was not until the Office of the Coast Survey was re-organized, in 1847, that a careful examination of this perilous

VIEW OF HELLGATE FROM NEGRO POINT.

GENERAL VIEW OF WORKS AT HALLETT'S POINT.

channel was undertaken. The first survey was made under the supervision of Lieutenant (now Rear Admiral) Charles H. Davis, towards the close of 1847. He made his report in February of the following year, giving a careful description of the rocks and currents of Hellgate, and suggesting a plan for the removal of the most serious obstructions. Nothing was done until the following year, when a new survey was made. A map was published, and in March, 1851, steps were taken to remove certain small but dangerous rocks by the process of blasting. The engineer in charge of this work was a Frenchman named Maillefert; he proposed to remove the rocks by exploding charges of powder against them.

The plan dispensed altogether with the slow and difficult process of drilling; he exploded his powder directly upon the rock, on the theory that the pressure of the water above the gas formed by the burning powder, would offer sufficient resistance to throw considerable force against the rock. His first blast was made on Pot Rock, and removed about four feet from its highest point. The plan was successful as long as the rocks were in a state of projection; but after these projections had been removed, and the explosions were made against a solid flat surface, they failed almost completely.

After this French engineer ended his operations, new surveys were made, and it was found that the channel, though greatly improved, was far from complete or satisfactory. Other surveys followed, and various plans were proposed; but the breaking out of the war for a time put a stop to the labors. In 1866 Brevet Major General Newton was sent by the War Department to examine the obstructions of Hellgate, and to arrange for their removal. In the following year he made his report, giving estimates of the time and money required to make a safe and easy passage-way for ships of all sizes: he proposed to remove, by blasting, the obstructions known as Pot Rock, Frying Pan, Way's Reef, Shell Drake, Heeltap Rock, Negro Point, Scaly Rock, Hallett's Point, and certain other rocks of smaller size.

He estimated that the channel could be made an average

depth of twenty-five feet below low-water mark; that the work could be completed in six years, at a cost of about six million dollars.

Another plan included the removal of these rocks and four others in ten years' time, at a cost of nine millions of dollars; and he presented another plan, by which some of the middle rocks should remain as they were; and the most serious obstruction, known as Hallett's Point, could be removed in three years, at a cost of three millions.

Hallett's Point is the most dangerous obstruction in Hell-gate. From shore to shore the distance is about six hundred feet; the reef extends more than three hundred feet from one shore, so that the actual width of the channel is reduced to three hundred feet.

The water boils furiously over this reef, and turns a large part of the tide upon the Gridiron Rock, frequently throwing ships upon it. The process of drilling and blasting was considered too slow and ineffectual, and it was proposed to remove the rock by sinking a shaft upon the shore, undermining the entire reef, leaving pillars to support the rock until the work of undermining was all completed, when, by a single explosion, these pillars could be blown away, the whole reef would fall, and the dangerous obstructions to the commerce of New York would be removed.

One pleasant day, in 1871, I was one of a party to visit the scene of General Newton's operations. Our party embarked on a small steamer at the Barge Office, and proceeded up the East River, stopping on the way to examine the operations in progress for the removal of what is known as Coenties' Reef. This reef is about six hundred feet from Pier No. 8, on the East River, and lies directly in the busiest part of the harbor of New York, almost in the track of the ferry boats between New York and Brooklyn, and has always been considered very troublesome and dangerous. Attempts have been made at various times to remove this reef, but none of them were successful until the plan of General Newton was tried. The reef is about 250 feet long, and is 130 feet wide in its broad-

est part. We found a large scow anchored above the reef, and were politely taken on board. The scow is very broad and heavy, and is firmly anchored, so that ships or steamers that run against it can be very little damaged.

In two or three instances, vessels that have come in collision with the scow have retired considerably damaged, while the large and unwieldy craft remains unharmed.

As we went on board we were taken to the centre of the scow, where there was a circular well about thirty feet across; and in this well there was a dome, which could be raised and lowered by means of machinery. At the top of the dome there was a "telescope," twelve feet in diameter, that could be extended or shortened in order to accommodate itself to the condition of the tide. The plan of working was to anchor the scow over the place where the rock was to be drilled, and then to lower the dome until it touched the rock. As soon as one part of it struck the rock, rods were pushed out from the side of the dome to rest upon the reef, and perform the work of feet: they readily adapted themselves to the inequalities of the rock, and as soon as they were fastened in their place the dome was almost immovable.

Inside the dome there were places for lowering drills, and working them, by means of machinery. The drilling engineer were run by steam, and the drills, nine in number, were operated simultaneously; the nine holes that they made were in a circle of about twenty feet in diameter. The drill penetrated the rock from six inches to two feet an hour, according to its hardness. When a round of holes was made, the scow was hauled off, the holes were filled with charges of nitro-glycerine in tin cans, and everything was made ready for a blast.

The work of blasting has to be done very rapidly, for the reason that a diver can only go down to arrange the charges at the period of slack water. Everything is made ready at the turn of the tide, and the very instant that the tide falls the holes are charged.

We were not in time to witness a blast; and on two other occasions, when I went to see an explosion, the performance

did not come off; some slight accident had happened, so that the slack water period had passed before everything was ready.

When the round of holes has been charged, the diver goes down. The pump to supply him with air is kept at work; the charges are lowered into the water one after the other, and placed in the holes where they belong. When he has arranged everything, he gives a signal and is drawn above. The boats then back away from the reef sufficiently far to be out of the way of the explosion.

The nine charges are fired simultaneously by means of electricity. The double wire, insulated with gutta-percha, extends into a small cartridge of powder, which is placed in the top of each charge of nitro-glycerine. The ends of the wire are brought quite near each other, and between them a small slip of platinum is soldered. The current of electricity, passing through the wires, heats this platinum to redness, and sets fire to the powder around it. The powder explodes, and its explosion sets fire to the nitro-glycerine. As the battery which furnishes the electricity is on board the boat, the current is thrown into each pair of wires simultaneously and thus the explosions occur at exactly the same moment.

A column of water shoots up into the air, the rock is torn and broken, and there is a general disturbance of the water all round it: ships and boats are warned, by means of a red flag, to keep at a safe distance. It generally happens that a good many fishes that have been swimming around the rock at the time of the explosion are killed, and rise to the surface; those that are not killed are very much astonished, and swim away with great rapidity.

The experience of a diver going down to arrange the charges is not highly agreeable. If he remains longer than the period of slack water, he finds the current so strong that it almost carries him off his feet; and it frequently becomes necessary for him to be drawn to the surface and abandon his work until the next turn of the tide. Should an explosion occur while he is below, it would be pretty certain to cause his death.

The substance which he handles is not the safest in the world, but the engineers seem to be agreed that it is much better in every way than gunpowder. They say that accidents which have occurred from the use of nitro-glycerine have been caused by careless or ignorant handling, and that many accidents to which powder is liable will not occur with nitro-glycerine.

General Newton explained to us that a few days before our visit a slight accident occurred, which would have proved fatal had they been using powder. At that time they were using fulminating caps instead of electricity; one of the fulminating caps was ignited, and set fire to the charge of powder: the case was broken and the nitro-glycerine was spilled about, but nothing serious happened. Had they been using gunpowder instead, the consequences would have been fatal.

In all the blasting operations in New York harbor at the present time, and in many other places, nitro-glycerine takes the place of powder; it is much more powerful in its effect, a single charge of it breaking and shattering a rock much more than gunpowder. It has the advantage, too, of extending its force completely to the bottom of the hole, whereas gunpowder very frequently acts only part way down the hole.

My individual experience of nitro-glycerine has not been of the most pleasing character. In 1866 I sailed from New York for San Francisco by way of Panama; when we reached Aspinwall we crossed the Isthmus to take the Pacific steamer at Panama. It was nearly sunset when we climbed up the gangway, and stood upon her deck; an hour later, the tug with our baggage, and with the express freight and mails, came out. I was standing near the gangway when the baggage and express matter came on board, and I think, though I will not be positive about it, — and some of my acquaintances say it is very unlikely, — that I assisted in taking a few of the boxes over the rail. Everything was stowed away, and about ten o'clock at night we steamed down the Bay of Panama, and were on our way to San Francisco. We reached the latter city in safety on a Saturday morning, and I was intro-

duced to a very large number of gentlemen, and most hospitably entertained.

Two or three days later, I was walking up Montgomery Street, and met a friend on his way to lunch at a well-known Club House: I would have accepted his invitation to lunch, only it happened that I had just breakfasted; and, bidding him good morning, or good afternoon, I walked slowly towards the Occidental Hotel. I had been there but a very few minutes before I heard a loud report, which jarred the whole building, and set people flying through all the corridors to ascertain what was the matter. I went out, and walked up the street the way I had come. The office of Wells, Fargo, & Co's Express was, if I remember correctly, two blocks away from the hotel. It turned out that the explosion which had jarred all that part of the city, was in the office of the Express Company.

To tell the story briefly, seventeen persons were killed, among them some of my personal friends, and as many more had been wounded. The Club House, where I was very near taking my lunch, had been blown up, and several persons who were sitting at the lunch-table were among the injured.

Among the boxes which had been on the steamer with me from New York to San Francisco, had been passed over the rail of the steamer at Panama, and which I had assisted in handling, there were two cases of nitro-glycerine.

One of these cases had exploded at the express office, its contents not being known, and consequently it had not been carefully handled, and in exploding it had set fire to the other. The force was sufficiently strong to cause a marvellous deal of damage, in and around the express company's building, to break hundreds, if not thousands, of panes of glass, some of them three or four hundred yards away; and all agreed that if those cases had blown up on our steamer we never would have been heard of afterwards.

"Suppose, now," said one of my fellow-travellers,— "suppose, now, those cases had exploded when we were taking them in at Panama. Why, the steamer would have gone, one half to the

bottom, and the other half up in the air, and some of us might have come down a thousand miles away."

A week or two after this explosion at San Francisco, there was one quite like it at Aspinwall, doing an amount of damage equal to, if not greater than the explosion at San Francisco. Since that time I have had a wholesome fear of nitroglycerine, and am always inclined to keep at a respectful distance from it. It may be a very good thing in its way, it may be entirely safe if properly handled, but I greatly prefer that it should not be in my way, and that somebody else should handle it.

From Coenties' Reef we went to Hallett's Point, and were landed under the supervision of the general in charge. We were delivered over to the hands of the superintendent, Mr. Reitheimer, who entertained us very pleasantly, and showed great politeness to the ladies and gentlemen of the party, especially to the ladies. He explained all about the works, and opened a mysterious case. In a very short time our heads were full of tunnels, drifts, headings, drills, champagne, nitroglycerine, reefs, derricks, pale sherry, and all that sort of thing. He showed us his plans and specifications, and then induced us to step into a wooden box slung at the end of a derrick, and be lowered away into a pit of fifty or sixty feet in depth.

This pit formed a shaft which had been sunk on shore to begin the operations upon the reef. From the shaft a series of tunnels extended very much like one's outstretched fingers. Between the tunnels there were smaller tunnels, running from one to the other, leaving pillars to support the rock and the water above. A strong dam had been built around the mouth of the pit to prevent the water from flooding it. The tunnels or headings, as they are technically called, have been designated by names instead of numbers. Most of the men working there are Cornish miners, and they are not fond of numerical designations. The superintendent originally called the central heading Number One, but it is now known as Farragut Heading. The others in order after it are Madison, Hum-

phrey, Hoffman, Sherman, Jefferson, Grant, McClellan, Franklin, and Jackson.

At the centre of the reef, the heading which is the highest is known as Grant Heading. Nine feet of rock is left to form a roof. The rock is not very hard, but it is full of seams and fissures, through which the water is constantly dripping. The narrow seams are closed by blocking, and when a wide seam is struck, it has to be closed outside.

In one case the miners came upon a horizontal seam, through which the water poured at the rate of six hundred gallons a minute, and before the flow could be stopped, the miners were standing in three or four feet of water. Bags of clay are kept in readiness on the edge of the coffer dam, over each heading, so that, whenever a seam is found, it can be closed as quickly as possible.

After we were lowered into the pit, we dodged the streams of water as well as we could, and went inside. The walking was not of the best, as the bottom of the tunnel was full of water, and rough fragments of rock were lying everywhere. Men were at work in the headings, drilling holes in the rock, and preparing them for a blast. They had penetrated to a distance of nearly one hundred and fifty feet from the entrance, and were obliged to work by the light of candles. Three or four of them were working in each heading. They were operating the drills by hand, but it was proposed to introduce drills operated by means of compressed air.

Work in those headings was not highly pleasant, as the water was constantly dripping in; and nearly every one engaged there was as thoroughly drenched as he would have been if some one had thrown him into the river. The miners are generally wet through when their day's work is ended, and their labor cannot be considered very healthful.

Of course almost our first inquiry was in regard to accidents. We were told that very few had occurred. It is a rule of the superintendent, when a blast fails, for some reason, to go off, the charge in the hole shall not be disturbed; but a new hole shall be bored alongside the old one. A miner on

VIEW OF SHAFT FROM THE DAM.

THE SHAFT, SHOWING HEADINGS.

one occasion violated this rule by attempting to draw the charge, and lost his arm in consequence.

The floor of the mine is in most places about thirty feet below low-water mark. The roof of rock overhead is nine feet in thickness, which would leave only twenty-one feet of water after the reef has fallen. It is the intention, when the headings have been driven far enough, to sink the floor eight or nine feet below its present level, so that when the explosion takes place, there will be nearly thirty feet of water above the fallen mass of rock. The water that comes through the seams is removed by means of steam-pumps, and sometimes the pumps are required to work very rapidly.

A very delicate piece of work, in connection with this mining operation, is that performed by the engineers and surveyors. It is necessary to know the exact condition of the surface of the rock above each heading, in order that the miners can push their work in safety. Careful soundings are made over every foot of the surface of the reef. The exact bearings of every sounding are taken. A tube is lowered down to the rock, and an iron rod is placed inside of this tube. By means of this rod the nature of the rock below is determined. Blows are struck with the rod, and from the sound of the blows a surveyor can understand whether the rock on which the tube rests is a detached piece or belongs to the entire reef. Over fifteen thousand of these soundings have been made.

All the nitro-glycerine used for the explosion, is made on the premises, and only so much is made as is required from day to day. The laboratory, as they call the place where this explosive material is manufactured, is an old boat-house, a little distance from the main works. It contains a bench covered with dry plaster of Paris to absorb any drippings of nitro-glycerine, a refrigerating chest, and cans in which the materials are kept. No one is allowed to handle the material unless perfectly conversant with its use, and every precaution is taken to prevent accidents.

One of these days the people of New York can be treated to an exhibition similar to that which was given some time

ago in San Francisco. There will be a grand explosion at Hallett's Point. When the whole reef has been undermined, and the floor of the mine has been lowered to a sufficient depth, the pillars that support the roof will be honey-combed with holes to receive charges of nitro-glycerine, and cans of the explosive material will be scattered about in the different headings. The electric wires will run from the battery at a safe distance, and at a given signal the connection will be made.

The waters of Hellgate will be thrown high in the air, and that reef which has stood so long an obstruction to navigation, and a detriment to the commerce of the greatest city of the United States, will disappear. The waters of Hellgate will cease their bubbling and boiling over that dangerous rock, and the great ships and steamers on their way from Europe will enter the harbor, avoiding the shoals of Sandy Hook, and making their way through Long Island Sound and the East River to a safe and convenient anchorage.

## V.

### BORINGS AND SHAFTS.

HOW COAL MINES ARE DISCOVERED. — OUTCROPPINGS. — SCIENTIFIC RESEARCHES. — HOW A MARBLE QUARRY WAS FOUND. — BORING A WELL, AND WHAT CAME OF IT. — A LOCAL DEBATING SOCIETY. — INTIMATE RELATIONS OF COAL MINES AND THE STEAM ENGINE. — STRIKING OIL. — "DAD'S STRUCK ILE." — THE UNHAPPY MAIDEN'S FATE. — COAL INSTEAD OF WATER. — THE TOOLS TO BE USED. — A DEEP HOLE. — TERRIBLE ACCIDENT, AND A MINER'S COOLNESS. — SINKING SHAFTS. — AN INGENIOUS APPARATUS. — ACCIDENTS IN SHAFTS. — REQUIREMENTS OF THE LAW.

UNTIL the beginning of the present century coal mines were discovered more by accident than in any other way. The coal seams make their appearance at the surface, that is, they "crop out," or "come to grass," as the miners say. Coal on the surface is generally of a poor character, for the reason that it has been for many hundreds of years subject to the action of the elements; but on digging down a few feet, or a few dozen feet, the quality is found to be greatly improved. When coal is thus found at the surface, a preliminary examination is conducted by cutting trenches, galleries, and pits, and if the conditions are favorable, the actual working of the mine can begin. Sometimes the mine is operated by a few cuttings, like the works of an ordinary stone quarry.

Most coal mines have been discovered and opened in this way; but when the coal is concealed beneath the soil, and nothing is observed on the surface, it is discovered by chance, or by geological indications. At the present day many coal mines are discovered by means of railway cuttings, or in sinking wells. Other mines are discovered in this way. Some twenty years ago, while a railway was constructing in Vermont, the workmen came upon a bed of marble, and it was found to be quite extensive. Speculators bought the land in

the vicinity, and thus the Vermont marble quarry came into existence.

In 1813 a well was sunk at La Sarthe, in France. Amongst the rubbish a black earth was noticed, which was sent to a provincial debating society at Le Mans. An extraordinary meeting of the society was called, and somebody suggested that this black earth might be coal. It was immediately tried in the stove in the room where the meeting was held, and it was found that the earth burned readily. An investigation followed. Careful examinations were made, and valuable coal mines were opened in the vicinity.

Some of the mines in the United States have been discovered in places where burrowing animals had thrown up the earth. Decomposed coal retains its original blackness; in several instances where it was found in the earth thus thrown up, careful observations were made, and work was immediately begun in search of coal. Some valuable mines have been opened in this way.

Many of the coal mines in France and Belgium, and also in other countries, have been found in consequence of the explorations of geologists. In the year 1716 a very skilful coal miner in Belgium made a series of explorations, and discovered very valuable mines. Under his direction they were explored for several years, but the works were at length abandoned, in consequence of the accumulation of water. In all parts of the world miners have always found great difficulty in proceeding in consequence of the interruptions caused by water, and until the steam engine was invented there was an absence of sufficient power for its removal.

In the eighteenth century deep pits in the Newcastle coal fields were filled with water, and it was necessary to drain these pits before the coal could be taken out. The ordinary pump was not sufficient for the purpose, and a more powerful engine became necessary. Inventions seem to come at a time when they are most needed. When the necessity for a powerful pump was greatest, the steam engine was invented. Savery, Newcomen, and Watt succeeded each other. Captain

ENTRANCE TO A COAL MINE.

INTERIOR OF A COAL MINE.

Savery constructed one of his "fire engines" to lift water from one of the Cornish mines; but the power of the engine was not great, and the quantity of water raised was exceedingly small.

Newcomen invented the atmospheric steam engine, in which the piston was lifted by steam, and when this was condensed the piston was forced to the bottom of the cylinder by the pressure of the atmosphere. Afterwards Watt improved upon the engine, and overcame the difficulty of removing the vast accumulations of water in the deep mines, about the middle of the eighteenth century.

There is a curious relation between coal mines and the steam engine. The latter was invented among the former, and without its application to pumping purposes the invention would have been to a great extent worthless, for by means of the very substance raised from the mines the engine is kept in motion. The mines thus furnished the material with which the engine is operated, and only with the aid of the engine can the coal mines be properly worked.

In the petroleum regions of America the borings and pumpings are frequently conducted by means of the gas which rises from the earth. Very often a steam engine is run without any other fuel than a stream of natural gas, conveyed beneath the boiler, and fed through a proper distributing apparatus.

To the coal mine we are also indebted for that great boon of modern civilization, the railway.

Coal is a heavy, bulky article, selling at a low price. Not only must it be removed from the earth, but it must be carried at a cheap rate, and often for long distances. Where there is no water communication the roads are the only mode of conveyance. Originally common earth roads were used, and the coal was carried in ordinary carts. These roads were improved, and, after a time, were in the condition of stone causeways, or macadamized tracks. Afterwards wooden tracks were used, over which the wheels would roll more easily than upon ordinary roads. These wooden tracks were at first placed in the underground ways of the mines, and afterwards extended to the ways above ground.

But wood is not durable ; it soon rots and wears away. The wooden tracks were subsequently replaced by others of cast iron ; originally these were grooved, but subsequently they were furnished with a lateral flange. Afterwards wrought iron was substituted for cast iron. In the first instance strips of cast iron were placed upon wooden rails, forming the old-fashioned strap rail. Afterwards was invented the ordinary rail as we now find it. The flange was removed from the rail, and placed upon the wheel, and thus, step by step, the modern railway came into existence.

Something more was wanted. Cars were propelled by means of horse or man power. It was necessary to apply the steam engine to the work of transportation. Trefethick, a Cornish miner, constructed a locomotive with a simple boiler, like that of a stationary engine ; but the heating surface and the motive power were too small. It was not then supposed that the wheels would turn upon a smooth rail and move forward, and so the driving wheel was toothed and worked in a rack. The speed was less than that of a carriage drawn by horses. George Stephenson, an old coal miner, completed the locomotive.

Seguin, in France, about the same time, invented the tubes which run through the locomotive boiler, and afford a passage to the flames. They greatly increased the evaporating surface, and consequently the production of steam. Stephenson discharged into the chimney the steam which had acted upon the piston, and thus gave a great draft to the furnaces. The locomotive was then complete, and since that day it has only been improved in its details.

We have wandered a little from the search for coal to speak of the steam engine, the locomotive, and the railway.

Many coal mines have been discovered by borings in search of artesian springs. About thirty years ago, in one of the French provinces, a well was being bored, and, quite unexpectedly, the boring tools revealed the presence of coal. As soon as this became known, everybody went to work searching, not for water, but for coal. In a region sixty miles long

by twelve or fifteen wide, the ground was perforated like a sieve, by a series of borings which were laid down on a plan that seemed to resemble a constellation of stars on a celestial map. Everywhere coal was found, and altogether one hundred thousand acres of coal fields were added to the wealth of France. Nearly thirty companies were organized to work the new mines. Since the discovery about fifty pits have been sunk, some of them to a depth of five hundred yards. In 1851 the mines produced five thousand tons of coal. At the present day their product is not far from twenty millions of tons. All this originated in a search for water.

The process of boring for coal is very much like, in fact almost identical with, boring for petroleum. The boring rods are of wood, or iron, and are screwed together as the work proceeds. The primitive instrument is a steel chisel, or bit, which strikes the rock and wears it away, precisely as an ordinary drill makes a hole in a stone ledge. Boring machinery may be operated by steam power or by hand. In the primitive way, a triangle, or pair of shears, supports the rods, and has an ordinary windlass, by which they may be raised or lowered.

One of the inconveniences attending the ordinary process of boring is, that the rock is pulverized, and nothing but little fragments of dust and mud are brought to the surface. Sometimes it is difficult to determine whether the stones through which the borer has passed are the proper ones to indicate the existence of coal, or whether the black matter comes from coal or shales. All these disadvantages have been overcome by means of a new instrument, which is in general use. A gouge in the form of a hollow cylinder is employed, furnished at the base with a row of teeth, or with several cutting blades of cast steel, and sometimes with a row of diamonds. It is worked like an ordinary borer or auger, and cuts a solid column or cylinder out of the rock as regular in shape as if it had been turned in a lathe.

When this cylinder has been cut to a sufficient length, it is

broken off by means of the gonge bit, or grapnel, which seizes it and brings it to the surface. The boring tool will cut a hole eight inches in diameter, leaving a pillar of rock in the centre which can be broken off at any desired length and brought to daylight. By means of this rock, the fossils in the stone may be studied, together with the structure of the strata, and all its peculiarities. Beautiful specimens of rock are frequently obtained in this way from great depths. Some borings have been made to a depth of nearly two thousand feet, with a diameter varying from eight to twenty inches.

As the boring tool reaches the depth at which the workmen expect to find coal, the operations are conducted with the greatest interest. Every motion of the rod is carefully watched, and when the fragments of rock or earth are brought to the surface, they are examined with great care. When the coal is discovered there is much rejoicing, as it is then certain that the prize has been gained. It is the same in boring for coal as for oil. When a man in Western Pennsylvania has "struck oil," and, according to the local expression, "struck it rich," he feels that his fortune is made. More than one man has thus raised himself above his fellows when his search for coal was rewarded with success. An old story, which has been told many times, and will bear telling a good many times more, is not inapplicable here.

During the period of the first oil excitement in Pennsylvania, a young man, whom the story represents to have been poor but honest, was paying his attentions to a maiden of his neighborhood. The maiden received his addresses, and the pair were engaged to be married. The father of the damsel was an oil seeker, and one day his search for oil was successful. That evening the young man visited his lady love. She received him coldly. He asked the meaning of the coolness, and she curtly replied, "I can't marry you."

"Why?" asked the young man, eagerly.

"Well," said the girl, "I *can't* marry you; dad has struck ile."

The young man went away sorrowing, for he had not great possessions. As the story goes, the damsel, who had been thus suddenly lifted from poverty to wealth in consequence of her father's oil discovery, remained unmarried for several months, but finally gave her hand to an engaging stranger from New York, who dissipated the family fortune as rapidly as it had been obtained.

In 1853 some wealthy gentlemen sought for coal near Creuzot, in France. The spot was carefully selected, and for four years the work went on. The tools penetrated to a depth of more than three thousand feet. This is probably one of the deepest borings ever made. An unforeseen accident stopped the work at that point.

The bore-hole was less than an inch in diameter, and was made by means of a steel chisel fastened into wooden rods, which were screwed together. The boring tool one day became broken at the bottom of the hole. All kinds of grappling implements were lowered to take hold of it, but none of them succeeded. The chisel seemed to be firmly lodged at the bottom, and resisted every attempt to withdraw it. After six months of effort the work was abandoned. One of the parties interested offered to subscribe half a million francs to be given to any one who would invent an instrument that could withdraw the chisel.

Several days after the abandonment of the enterprise, the foreman of the work mounted the staging and made another effort to raise the broken tool. The whole power of the steam engine was exerted in pulling the ends of the rods, when suddenly the rope gave way. The man's hand was caught and crushed between the rod and one of the planks through which it passed. He stood there and shouted to the man to saw off the rod in order to release him. Then holding the remains of the ruined hand in the uninjured one, he walked to Creuzot, three miles away, and without uttering a word of complaint, underwent amputation at the wrist.

After the coal is discovered, whether through surface indications or by borings, the preliminary working begins by

means of a shaft and levels. Generally the first step is to sink a shaft or pit. When the ground is soft, the pit must be walled with brick, stone, or timber, as fast as the descent is made. When the pit is sunk through limestone and sandstone, the progress is slow, but the walls sustain themselves, and do not require either masonry or timbering. A great inconvenience in sinking a shaft arises from springs and small streams of water. In many places where this inconvenience occurs, the shaft is fitted with a wooden lining, or tubbing, as it is called, which is made of thick staves somewhat resembling those of casks, the joints being carefully fitted, in order to keep out all water, and to withstand great pressure. Sometimes this tubbing is made of iron, wrought or cast. Where the ground is loose, or composed of sand and water, the tubbing is forced down from the top, or sinks by its own weight. When this tubbing consists of masonry, it is built in a circle at the surface, and as fast as the earth is removed the masonry sinks. A fresh circle is added at the surface, and thus the work goes on. It was in this way that Brunel constructed the shafts which formed the descent into the Thames Tunnel. Sometimes shafts are sunk under water, and in such case they are lowered in a perpendicular position until the ends strike the bottom, and then the water is pumped out. An ingenious apparatus raises the mud from the bottom, and a pump is kept at work to remove the water.

Sometimes, in sinking a shaft through quicksand, the water runs in faster than any ordinary mode of drainage will remove it. M. Triger, an ingenious Frenchman, invented a machine by which the water could be pumped out. The cylinders of iron were five or six feet in diameter, and he divided them into three compartments, as nearly air-tight as possible. He forced compressed air into the lower one, and enclosed the workman inside. The man was thus in a sort of diving-bell. The compressed air, being forced against the bottom of the shaft, prevented the great mass of water from filtering through the sand. The small quantity which filtered in was, by the force of the compressed air, driven through the sand pipe

communicating with the surface. "Imagine an army of mice," the inventor graphically said to M. Simonin, "and a cat suddenly to make her appearance, and you would have the picture of water reaching the bottom of our shafts through a thousand holes in the ground, if the presence of the air is lowered, and returning suddenly to the surface as soon as the air recovers its tension."

The rubbish and running sands are removed in buckets by hand, or by means of a rope passing through a pulley. Trappdoors communicate from one stage to the other, by means of which the buckets are removed without any serious loss of the compressed air. Shafts may be sunk through quicksands in this way to a depth of eighty or one hundred feet without difficulty. The laborers who pass their time in the compressed air work as easily as in the open atmosphere. Some of them, however, cannot remain there long, especially if they have the drum of the ear very delicate, or are in the habit of drinking to excess. The pressure of air in the chambers rarely exceeds three or four atmospheres.

This apparatus is frequently used for laying the foundation of bridges in the beds of rivers, where there are deep quicksands. The famous bridge of Kehl, near Strasbourg, was constructed in this way, and the engineers say that without some such apparatus the construction of the bridge would have been impossible.

If a shaft has been sunk and properly supported, — that is to say, timbered or walled, — it is generally divided into compartments. The shafts are generally from fifteen to twenty feet in diameter, and consequently there is plenty of space for dividing them. One of the compartments will serve for the tubs, cages, or buckets, in which the coal is raised. Another is for pumps to draw off the water, and sometimes where the miners go up and down by ladders a compartment is made especially for them.

In all cases one compartment in the shaft serves as an airway or chimney, whether the draft is free or not. In some countries the law requires that there shall be more than one

shaft, or opening, to every mine, while in other countries no such law exists. Many of the owners of mines are abandoning the single shaft system, and gradually supplying their mines with more than one entrance. Many terrible accidents, accompanied by a great loss of life, might have been avoided had the mines been constructed with more than one entrance or shaft. A striking example of this is in the terrible calamity at Avondale, a few years ago. The most approved arrangement of shafts for a large mine where there is explosive gas, and where water is to be pumped, is to sink one shaft for the pumps, another for raising coals, and a third for ventilation. At the bottom of the third one a large furnace is always kept burning.

In some of the mines there may be half a dozen shafts. Those through which the coal is drawn are called the winding pits, those where the pumps are fitted are called pumping pits, those where the men go up and down, are called labor shafts, and those for the passage of air are known as air shafts.

In many mining regions there is a class of pits that have been abandoned in consequence of the coal beneath being worked out. Sometimes these pits are made use of for purposes of ventilation. Proper care is not always taken of these abandoned holes, and they form dangerous precipices, through which a careless person may easily fall and be killed. Strangers strolling in the vicinity of mines occasionally step into these shafts and disappear, to be seen no more alive.

## VI.

### ACCIDENTS IN SHAFTS.

ADVENTURE OF THE AUTHOR DESCENDING A SHAFT. — A MINUTE OF PERIL. — LIFTED THROUGH A SHAFT BY ONE LEG. — A COLLISION IN MID-AIR. — SENSATIONS OF THE DESCENT. — A MINER'S VIEWS OF DANGER. — PICTURESQUE SCENE AT A DESCENT. — OFFERING PRAYERS. — SCENE AT A RUSSIAN MINE. — SAFETY CAGES. — THEIR CONSTRUCTION. — A LUDICROUS INCIDENT. — HOW A MAN FAILED TO KEEP AN ENGAGEMENT. — DOWN IN THE SALT MINES OF POLAND. — A PERILOUS DESCENT. — "PLENTY MORE MEN." — ACCIDENT NEAR SCRANTON. — "PUTTERS." — HOW GIRLS WERE USED IN SCOTLAND. — MAN ENGINES. — THE LEVELS. — AN ACCIDENT CAUSED BY RATS.

My first journey down the shaft of a mine had of course a novelty about it, and also partook of the sensational.

It was not a coal mine into which I descended, but a copper mine. We stepped into a basket suspended by a hempen rope, and our conductor gave the signal to start. The engineer slacked away the rope somehow, and we descended rapidly. It seemed to me very much like falling out of a balloon.

I never have fallen out of a balloon, and therefore cannot say positively whether the sensation was like it or not. I have been up in a balloon, and the sensation of going rapidly upward through the air is very much like that of going rapidly downward into the earth.

Down, down, down we went; and though the time was short, it seemed to me pretty long. I had heard that there was generally at the bottom of the shaft of a mine a pool of water, which is called, in technical language, a "sump."

I had a suspicion that we might be plunged into it, and asked our conductor if there was any danger.

"O, no danger at all!" he replied. "All that can happen to  
(91)

you is, that if you get into the sump you will get drenched ; and then, if you do not like it, you can be drawn to the surface so rapidly, that every thread on you will be dried out again."

This proposed process of wetting and drying did not please me, and I intimated an emphatic hope that the engineer knew his business, and would stop at the proper time.

The descent was not quite eight hundred feet, but it seemed to me at least eight thousand. Every little while we passed a hole, through which the light glimmered, and we could see, though only for the instant, into the various portions of the mine. In one place, a miner was standing at the end of a level, and standing, too, very carelessly on the edge, and we narrowly escaped brushing him off. Had we brushed against him, and thrown him from his perch to the bottom, he would not have been worth three cents a pound after being picked up.

When we reached the bottom, the basket was in a sort of basin, with a flooring of plank just even with its edge. Miners were standing there with lanterns in their hands, or with candles stuck into their hats, and they assisted us to scramble off.

We had sufficient time to get out — or seemed to have ; but one of the party, who had crouched to the bottom of the basket, was a long time gathering his limbs together, and picking himself up. He did not pick up fast enough. The engineer waited what he thought was a proper time for us to get out, and then the basket began to move upward just as the dilatory man was putting a leg over its side. As the basket moved up, he was partly in and partly outside, and there was a prospect of witnessing a very pretty accident on his account.

He was a distinguished stranger, and it would never do to have a person of his prominence killed there. Our conductor seized the signal-rope and gave it a violent pull, which caused the engineer to send the basket back again, and wait until everything was ready. The dilatory visitor scrambled out of

the basket, and gave a sigh of relief when he stood upon the planking.

The shaft of a mine is a very good place for accidents. Many of these occur from the carelessness of the miner, or the engineers, and sometimes from their incompetency. By the old system, baskets or buckets were raised or lowered by the winding or unwinding of a rope. Of late years, a cage, travelling in guides, is used, which is much safer than the old system. The miners are careless in consequence of their long acquaintance with the mines. Familiarity breeds contempt, with dangers as with everything else.

The first descent into a mine generally raises the pulse, and very often seriously alarms the visitor. The miners will stand carelessly on the edge of a bucket; but the strangers generally seat themselves at the bottom, and it is sometimes necessary to turn the bucket upside down on reaching the floor of the mine before they can be induced to come out.

The shaft always appears smaller than it really is on account of the darkness. It is never well lighted, and very often the glimmer of the lamps is just sufficient to make darkness visible.

Visitors are always subjects of merriment to the miners. They show more or less fear in all their movements, especially in ascending and descending; but the miners go up and down the shaft laughing and talking, just as the soldier goes under fire and faces the storms of bullets.

The sight of the miners going down is a curious one. The men stand ready around the mouth of the shaft, and at the sound of the bell they crowd into the tubs or cages, or go down the ladders. Their voices can be heard a moment, and then they gradually become fainter and fainter, till lost in the distance. In some mines on the continent of Europe, prayers are offered by the miners before going down; in most mines, however, this is neglected, but many of the men cross themselves on leaving the upper air, and breathe a short prayer to St. Barbe, the great patron saint of the miners.

It is interesting to note the sudden pause in the conversation, to see the hands making the sign of the cross, the lips of

the hardy miners moving, and then, a moment after, to hear them break forth again, and talking as merrily as ever.

I remember, on one occasion, visiting a mine in Russia, where the men gathered at the mouth of the pit seemed engaged in some sort of a dispute. Their voices were loud, and many of the tones were angry. Suddenly a bell was sounded, and in an instant every cap was removed, and every man went through the Russian ceremonial of crossing himself. This ceremony over, caps were restored to the heads of the owners, and the conversation was resumed as loudly and excitedly as ever.

I have seen a soldier standing at his post, as a sentry, when the bell sounded, or the gun was fired, telling the hour of sunset. As the flag descended from the staff, the soldier supported his musket with his left arm, while with his right hand he performed the ceremonial which had been taught him by the church.

The shaft is frequently called the miners' tomb; and it is said that the Belgians have intentionally named it *The Grave (La Fosse)*.

In some mines, so many accidents have occurred in the shaft, that the men never enter it without fear. Great improvements have been made in the mode of ascending or descending, and at the present day the apparatus is considered nearly perfect.

The first improvement for the protection of men ascending and descending, was to cover the tubs with a roof, or bonnet, so that falling materials would injure nobody. Besides this, the heads of the men are shielded by hats made of sheet iron or stout leather. An indicator is kept in front of the engine man, so that he knows precisely the position of the tub; and if there are two tubs in the shaft, one ascending and the other descending, he may know when they pass on their way. In some coal mines the tubs or cages are double-decked, and some of them have four tiers or decks.

The greatest improvement is in the use of safety cages. These consist literally of cages with a strong top to protect

**DESCENDING A SHAFT.**

the persons inside against the stone or other falling substances, and with wooden guides at the side with which the roller wheels of the cages come in contact.

If anything falls, the top of the cage protects the men. If the rope breaks, a spring above the cage is set free, and catches in the guide, bringing the cage to a stand-still suddenly. A great many accidents have been prevented by this contrivance.

Some of the safety cages, instead of wooden guides at the sides, are provided with long, stout strips of cast or wrought iron. If the rope breaks, a spring at the top is suddenly thrown out, and catches in one of these notches. Safety cages of an improved pattern are in use in many of the principal hotels of America, as well as in mines. They have been manufactured comparatively but a few years. Soon after the Gould and Curry mine, in Nevada, was opened, one of these cages was placed in the principal shaft. The owners of the mine were doubtful of its powers, and the owner of the machine set about convincing them. When everything was ready, he loaded the cage with a ton of stone, then stepped on its top, and standing there suspended several hundred feet above the bottom, he deliberately cut the rope. A shudder ran through the crowd of spectators who were standing around; but their terror was of short duration. The stout springs were thrown out, and the cage did not descend six inches, after the severance of the rope, before it came to a stop.

Ludicrous incidents sometimes occur in these hoisting machines. In one of the hotels in New York, not many months ago, the machinery one day became deranged while the elevator was in use. It was full of passengers, and was between two floors in such a way that nobody could get in or out. It required an hour and a half to arrange the machinery, and in this hour and a half a dozen persons were closely confined in the cage. Such a combination of growls was never before heard in so small a space at one time in that hotel.

It was about half past two o'clock in the afternoon when the elevator stopped. One man had a note to pay before three o'clock. He did not pay it. One lady in the elevator had

left a friend in the parlor, and promised to be down again in five minutes, "as soon as she could arrange her bonnet." She did not keep her promise with her friend. Another man was very thirsty, and was on his way to his room to order up a drink. His thirst continued. And so through all the dozen persons who were detained in the elevator. Every one had an important engagement, or a special reason for being in a hurry, when hurrying was of no earthly use.

In some of the mines of Europe there are neither safety cages, tubs, nor baskets. At the salt mines of Wielizka, in Austrian Poland, the miners go down at the end of a long rope, to which several loops are fastened. Each loop has a band across it to support the back. The miner seats himself in one of these loops, leans against the band to support his back, clings to the rope with one hand, and holds his candle in the other. Half a dozen men form a bunch in this way, and sometimes there is another bunch above them. At a little distance the groups very much resemble a living chandelier. Not only miners, but visitors, are lowered in this way, and the descent is very trying to a nervous person.

A traveller who went into the Wielizka mines in this way says he asked if men did not sometimes fall out of the loops. "O, yes," replied the person addressed; "but this is of no consequence. Men are abundant about here, and when one is killed there is always somebody ready to take his place."

Until quite recently, — that is, until the introduction of the safety cages, — accidents from collisions were quite common. Sometimes two tubs of coal are fastened to a rope, not one above the other, but side by side. One day, at a Belgian mine, where they were accustomed to send up the coal in this way, as two men were going down the shaft in a bucket, they came in collision with the ascending coal. Both men were standing, one of them holding the lamp and the other clinging to the chains. The shock of the collision unhooked their tub, and they were left, three hundred feet from the bottom, holding on to the rope. This shock caused the ascending coal buckets to tilt, and large blocks of coal were

thrown out and fell down the shaft. They clung convulsively to the rope, and by a marvellous piece of good fortune, neither of them was injured. They reached the termination of their journey, and the instant that they touched the bottom of the shaft both of them fainted.

Just as one of the same men, at another time, was getting ready to go up the shaft, the engineer started the rope too suddenly. The tub was partly overturned, and the man, with one leg hanging in the tub and with his head downwards, was hoisted nearly a hundred feet up the shaft. By this time an alarm was raised, and they managed to stop the engine and bring the miner back again.

In mines where there are several shafts, there is generally a positive rule against the miners ascending through the pits where the coal is raised. The rule, however, is frequently disregarded, and sometimes the disobedience of the men leads to their death. Occasionally, when the miner is ascending in this way, a lump of coal falls upon and seriously injures or kills him.

At one of the mines near Scranton, not long ago, two miners were ascending in this way, and a block of stone fell from the wall, killing one of them, and injuring the other so that he lived but a few days. In some of the English mines they used to have a system of descent something like the Polish one. Two men were side by side, each of them passing a leg through an iron chain, which was fastened to a rope, and formed a seat. Accidents in this mode of descent frequently occurred, sometimes from carelessness, and sometimes from a man coming in contact with some unexpected obstacle. This mode is never used at the present day, excepting in very shallow pits. Frequently the man would be thrown to the bottom of the shaft and dashed to pieces, full in the sight of his terrified companions, who could not render the least assistance.

In old times coal was taken out of the mines, not by means of hoisting apparatus, but by bearers. Carrying a staff, and with their feet bare, they were obliged every day to carry a

certain number of loads up the inclined road leading to the surface, supporting their burdens on the staff while stopping to rest. The roads were slippery and rough, and the employment was very dangerous.

In some English and Scotch mines, and also in some of the French mines, where the seams of coal are thin, boys, who are called "putters," are employed to draw small carts along a railway. They fasten themselves to the cart with belts around their waists, and draw it along, going sometimes on their hands and feet where the road is wet and rough. Sometimes one of them pulls the cart while the other pushes it. In some of the Scotch mines girls formerly performed this work; but of late the laws do not allow women to work underground.

Girls used to carry on their backs a basket fastened to a leather strap which passed around their foreheads. A lamp was attached to the strap, and in this way they carried their loads up the long ladders and through the inclines, sometimes a distance of several hundred feet. If a strap broke, a block of coal fell, or a bearer missed her footing, those below were seriously hurt, and many fatal accidents occurred. This primitive mode of raising coal was abolished by law. The owners of the mines had become so careless in regard to the management of their laborers that the government was obliged to interfere.

For the past forty or fifty years movable ladders have been used in many mines both in Europe and America, though less extensively in this country than in the former. In England they are called "man-engines," and are constructed on a principle of reciprocal motion of two parallel rods. The rods are placed about fifteen inches apart, and steps and handles are so arranged as to be at about the ordinary height of a man. By the action of the steam engine one of the rods is raised to a certain height, while the other is lowered for the same distance. During the movement of the crank over its turning point, the miner goes from the step on which he stands to the opposite step. Another stroke of the engine is made, and the

rod moves in the opposite direction, and is followed by a fresh movement of the miner. Whether he goes up or down, the man rises or descends without any fatigue, and the journey is made in a very short time.

Many of these engines have been abandoned for the safety cage. The rate at which the men were lifted by them was seventy-two feet a minute, or a little less time than would be required for ascending by the rope. Another machine in use in Belgium and France is a single rod, and in place of the steps there are fixed platforms holding two men each. The length of stroke of the machine is about nine feet, and it will make twelve or fifteen strokes a minute.

The man travelling by it must be very watchful. He must pass from the movable ladder to the landing stage or platform, and watch for a new stroke or step upon the ladder. To avoid accidents he must use great caution, and no hesitation. The slightest embarrassment may cause a very serious accident, and the sudden return motion may kill the traveller on the spot.

From the bottom of the shaft of a mine the men scatter in various directions to their work, or are distributed among the different levels. A shaft is perpendicular, while the level is horizontal. The dangers in the shaft have already been described. Strictly speaking, no dangers of the same sort are liable to occur in the levels. True, there may be falls of rock or coal, or whatever other substance forms the roof of the mine; but they generally occur in consequence of the carelessness of some person on the same level, and not above or below.

Levels are described by their names, though they are not always in a strictly horizontal position. Sometimes they dip at considerable angles, owing to the formation of the rock, or the position of the substances to be mined. They are made of various heights, though generally of not more than six feet. The materials used for lining the shaft — that is, brick, timber, or stone — are likewise employed in the levels, and the modes of strengthening in both cases are very nearly the

same. Where the work is intended to last more than six or eight years, it is generally set up with stone, and not timbered. Where it is intended to last a long time, and especially if the rock through which it runs is of a yielding nature, it is strongly arched with masonry.

Sometimes it is necessary to make an arch below as well as above, for the reason that the flooring of the mine is apt to swell up in consequence of the pressure from below. Masonry used in levels is very much like ordinary masonry, and requires no especial description.

For timbering levels there are three timbers—two uprights and a head-piece. Sometimes there is a fourth piece, placed at the bottom, known as the sleeper, or sill. This is used, however, only when the flooring is soft, or consists of a substance that is apt to bulge up.

The pressure from above, as well as the lateral pressure, frequently bends and breaks the timbers. This bending and breaking of the timbers, occasioned by the settling of the earth, are rarely sudden in their occurrence. At first there will be observed a slight bending of the timbers; the next day the bending will be seen to be greater; and sometimes a month, or even six months, may pass before the timbers are sufficiently curved to break. Frequently levels that have been made five or six feet in height will, in the course of a few months, be reduced to a height of not more than three feet. The timbers will be bent around in all directions, and it requires considerable nerve to pass between them.

Where the mines are moist, the timbers soon become covered with fungus, and a vegetable peculiar to the interior of the mine makes its appearance. Sometimes it is not unlike light cottony material; occasionally it is snow-white, and again like tanned leather, or of a bright yellow color. The timber, when rotting, has an odor like that of creosote, and is familiar to everybody who has passed any time in deep mines.

Rats abound in mines, and are frequently very numerous. They make themselves at home, and are as comfortable as possible. While the miners are at their dinners, they frequently

play around them, and appear on friendly relations with them. Occasionally, they become so hungry that whenever a candle is placed in the wall, and the miner's back is turned, the rats will rush forward and seize the prize at the risk of being burned.

Sometimes rats are the cause of accidents. Some years ago an explosion occurred at a mine in Wales, when several men lost their lives. There was one pit which was known to be full of explosive gas, and the men were warned to be very careful of their movements with their lamps. A lamp, in which the glass was surrounded with iron netting, was placed on a shelf in the part of the mine where the men were at work. The miners were a few yards away, when they noticed half a dozen rats clambering about the lamp, and saw them tip it over. It fell from the shelf and struck a lump of coal. A hole was made through the wire gauze, the lamp was broken, and a terrible explosion of gas followed.

### SPECULATIONS IN NEVADA MINES.

**MINING SPECULATIONS. — SWINDLERS IN NEW YORK AND BOSTON. — THE AUTHOR'S EXPERIENCE. — HOW HE WAS CAUGHT. — THE HOOK AND THE WAY TO BAIT IT. — LIMITED INVESTMENT. — THE ADVENTURER'S STORY. — FACTS AND FIGURES. — THE ROMANCE, AND THE SUBSEQUENT REALITY. — ONE HUNDRED PER CENT. A MONTH. — IRISH DIVIDENDS. — EXPLOSION OF THE BUBBLE. — THE VICTIMS AND THEIR FATE. — NANKEEN TROUSERS IN WINTER. — AN ADVENTURER'S EXPERIENCE IN LONDON. — HOW HE CAUGHT A CAPITALIST. — HELD BY THE GLITTERING EYE.**

AMONG the various mining operations, there are many in which there are tunnels, and levels, and shafts of a metaphoric as well as of a literal character. This is peculiarly the case in our great cities: copper mines on Lake Superior, gold mines in Colorado and California, silver mines in Nevada and Utah, iron mines in Pennsylvania and elsewhere, have been exploited, in many instances, much more successfully in New York and Boston than at the places where they are located, or supposed to be located. In many instances, the mines which are sold have no existence whatever; millions of dollars have been paid in New York, Boston, Philadelphia, and other cities, for mines which had no existence, or next to none.

Some years ago, it was my fortune to become infected with the silver mining fever. It was at a time when speculators from the far West and the Pacific coast were abundant, and their operations upon the credulous and unsophisticated natives of Manhattan Island were wonderful to behold, and became disagreeable to remember. What poor innocents we were! I had had some experience with gold mines, and other mines, and I knew, or ought to have known, that honesty did not abound among their manipulators to any alarming extent.

**NEW YORK SPECULATORS AT THE MINES.**

**DEMONSTRATING THE VALUE OF A SILVER MINE.**

Most of those who came to New York with mines for sale were men of pleasing, though rough exterior, and their tongues were as flexible as the hair-spring of a watch. They could talk the ears from a donkey without moving a muscle; and the strangest part of it was, that the donkey would, generally, lose his aural appendages without knowing it: he would listen, and would deliberate, and, like the woman who deliberates, he would be lost. His hand (on the supposition that a donkey possesses hands) would go down to his pockets, and he would place the money — whether honestly or dishonestly acquired nobody knew — into the hands of the beguiling speculator; and the speculator thereupon would retire to the fastnesses of his hotel, and waste the substance of the verdant New Yorker in riotous living.

I was introduced to one of these adventurers, who owned a silver mine of wonderful richness. Figures were exhibited, and a plan of the mine was spread before us: it was a gorgeous parchment. The mine, with its dips, and spurs, and angles, was carefully delineated.

There was a picture of a crushing mill in full operation, and there was all the machinery portrayed on that parchment for running a first-class mine. A dozen of us were invited to meet the speculator the next day in a cosy little office where we could see specimens from the mines.

The speculator was there at the appointed hour. We came, we saw, and *he* conquered: there was a fortune before us.

"Gentlemen," said the speculator, "this is the finest mine within forty miles of Frogtown." Frogtown was the name of the city nearest to the great mine; I believe he called it the Revenue mine — good name, that, to enterprising men who wanted to increase their revenue.

"Gentlemen," he continued, "before this mine was discovered a good many people around Frogtown talked of moving away, but as soon as it was opened nobody wanted to leave. The population has increased a thousand per cent. in three months, and it will continue to increase quite as fast; in a year from now we will have a population of fifty thousand,

and we can employ three thousand men at least in and around the Revenue. I won't sell the whole of it, gentlemen; you have not money enough in New York to buy the whole of this mine; but what I want is to raise money to develop it. There is a mine there worth a hundred millions of dollars, at the very least; but you see it may be worth millions of dollars, and at the same time it will want money to develop it."

"I don't exactly understand," said I, "why you came all the way to New York to get money if the mine is so rich."

"Why, the thing is very plain," said he; "the people that came there have a use for all their money. Money is readily worth twenty-five per cent. a month at Frogtown, and it is hard to get it at that; men can do so much better there."

"I have in mind, now, a man who came there over six months ago with two thousand dollars; he has invested it in such a way that it is returning him four thousand dollars a month. Any man who knows anything about the business there, will readily put in his money where it will make him a fortune: it is the best place in the world for investing money."

"That does not answer the question," said another: "why can't you get the money in some place near Frogtown, from people who know about your mine, and know how rich it is? and, any way, if you have so valuable a mine, why do you want to raise money?"

The Frogtown adventurer smiled a sarcastic smile, as if amused at the ignorance of the questioner. The smile was brief, but convincing, and gave full weight to the statement which followed it.

"Suppose now," said he, "that you are in a house where you had a clear title to anything you discover. Going through the cellar of the house, you find an iron chest: you strike that chest, and you are sure you hear money rattle inside of it. You attempt to lift it, but find it too heavy: now what do you want to do? Plainly you want to open the chest; but it is firmly locked and is very solid. You look around for some implement with which you can break it open, but nothing of the sort can be found. There may be other men standing around,

but nobody among them has any tools that will help you. You look all through the house, but not a tool can be discovered: plainly you must go out of that house to find something that will help you to get at your money.

"Now, that is exactly the fix that we are in: our mine is the money chest, Frogtown is the cellar, and Nevada is the house. To open that mine, to make the shafts and to get the machinery, we must have money. The silver is there, plenty of it; but before we can put it into the market we must dig it out and refine it, and that is exactly the position. Your money chest will be of no use to you until it is opened, neither is the mine of any use until it is at work. You might have a property worth a million of dollars and not have a shilling to buy your breakfast with."

He repeated that winning smile, and we were convinced.

He continued, "I will not sell the whole mine for all the money in New York, but I am ready to put it into a stock company, and sell half of it for sixty thousand dollars; and as soon as the money is paid in, we can go to work and develop the mine. It will return you, gentlemen, a hundred per cent. a month on your investment, and it will begin to pay dividends within three months, and the dividends, gentlemen, will be paid in coin, dollar for dollar."

This was better still; gold was then at a high premium, or, what amounted to the same thing, greenbacks were at a heavy discount. Twelve hundred per cent. a year in coin was something not to be despised. We thought we ought to get more for our investment, but were willing to begin at that rate.

We made up the company, and were only allowed to put in one thousand dollars each. The speculator was a philanthropist: he wished to benefit as many as possible of his fellow-men; he would not consent that so great a blessing should be enjoyed by a few. "I want," said he, "as many men as possible to have an interest in this matter. I want to show everybody that I am dealing fairly and honorably; and to satisfy you that everything is correct, I have plenty of references."

He mentioned several gentlemen more or less well known.

Among them was one who, by a lucky circumstance, was in the very building where we were assembled. He was sent for, and came to our meeting.

He confirmed all that had been said by the rosy-lipped speculator; in fact, he confirmed a great deal more than had been said by the latter. Our thoughts, as we listened to him, were like those of the Queen of Sheba when she looked at the bank account of King Solomon.

We hastened to pay our money and secure our shares of the greatest silver mine of this or any other age. In a few days we obtained the certificates of our stock. They were beautiful specimens of the lithographer's art, and nearly as large as a first-class morning newspaper. Of course there could be no doubt of the genuineness of an undertaking that was set forth on certificates like these.

Time passed on; that is to say, a few weeks passed on. We visited the office of the company every day or two, and heard nothing but the most glowing accounts. We heard daily of unfortunate and grief-stricken individuals who had been left out in the cold, who were seeking frantically to obtain some of the Revenue stock, but found, to their sorrow, that none was to be had. Each of us had invested his one thousand dollars, and was not allowed to invest more. Those miserable beings who had not been in on the ground floor, and were anxious to buy, were offering, — so we were told, — a hundred per cent. advance for shares, but none of us would sell. We scorned to double our money when we should soon begin to receive every month an amount equal to our investment. Never did a bull-dog cling with more tenacity to the under jaw of another bull-dog than we clung to the stock of the Revenue.

But soon our picture of coming wealth began to lose its brightness. Our first dividend was an Irish one. As soon as the sixty thousand dollars were paid in, we were told that the sixty thousand dollars had gone for the purchase of the mine; that is to say, our half interest in it. Thirty thousand dollars were now needed for the purchase of a mill. Of what use would be a mine without a mill?

We admitted the force of this reasoning, and, not without much grumbling, we raised the money to purchase the mill. With the innocence of toothless and milk-imbibing infants we supposed that the purchase of a mill would put our mine in a paying condition.

The mill was bought, and then we were told that money was required for transporting it from San Francisco to Frogtown. About that time I began to see a hole through the ladder, and concluded there was a large-sized cat in that beautiful meal tub. I determined to send no more good money after bad money, and refused to pay any more assessments.

Some of my friends, however, who had gone into the enterprise, determined to stick to it. They paid the money on their share, or as much as was required for the transportation of the mill. When this was done, there was a call for more money to purchase a steam engine. Then the confounded engine had to be transported from San Francisco to Frogtown. More money. Then a mill site had to be purchased. More money. Then the mill site must be prepared for setting up the mill and machinery. More money. Next, the mill must be set up. More money. Next, a wood ranche must be bought; you could not run a mill without fuel. More money. Next, a shaft must be opened. More money. Next, a road must be built from the mine to the mill. More money. Next, chemicals must be bought for extracting the silver from the crushed ore. More money. And so it went on.

One after another my friends dropped out of the enterprise, and if they had not dropped out, I believe that every month would have brought forth some new device for tapping their pockets. Every one of them who stuck to the speculation longer than I did, became as financially dry as the middle of the Desert of Sahara.

"I tell you what it is," said one of them; "I have speculated in this silver mine all summer, and now I must wear nankeen pants and gaiter shoes all winter. A sitting of draw poker with one of those Mississippi fellows, who 'does not know anything about the game,' but somehow cleans you out before

you leave the table, is nothing compared to speculating in a silver mine."

I fancy that a great many men could tell a story very much like this. The game was cautiously and carefully played. We were baited with that very gaudy fly which only allowed us to put in a thousand dollars each. We did not see the point at first, but we saw it afterwards.

When a man has invested a small sum of money he is more likely to let the swindler go unprosecuted than if his investment is a large one. Had we invested five, ten, or twenty thousand each in the enterprise, according to our financial condition, we should have devoted time, and trouble, and money to the prosecution of the speculator and his fellow-conspirators; but as our investment was comparatively small, we allowed the matter to drop. And then we were more readily deluded than if a larger sum had been demanded.

Swindling in mining speculations has become an exact science, and to carry on a swindle successfully requires a good knowledge of human nature, and of the expense of lawsuits.

The Revenue silver mine never paid a dollar to anybody, except to the man who sold it. A small quantity of machinery, and a steam engine, of about four dog power, were transported to Frogtown and set up; but they were seized afterwards, and held for a claim of the San Francisco iron merchant.

A shaft was sunk — that is, a hole was dug — about six feet deep, where there was no more prospect of finding silver than in the back yard of a Fourth Ward boarding-house. The deepest and most profitable shaft of the Revenue silver mine was sunk in the pockets of those who bought it.

As for the speculator, I believe he subsequently died in Nevada. As John Phoenix would say, "He was one day addressing a large audience, and when his speech was concluded, he dropped from the end of the wagon where he was standing, and the rope which fastened him to the tree being too short, he fell, and broke his neck." At any rate, I saw his name one day in a paragraph from a territorial newspaper, which read about as follows: —

"John Smith, equine abductor, was treated to a neck-tie sociable yesterday morning at sunrise, under the largest tree that could be found in the vicinity. The boys got up a nice surprise party for him."

The day of mining speculation of this sort has not passed away, but the capitalists of New York and other eastern cities have had their eyes opened, and are not so easily taken in as they were of old.

Some of the enterprising speculators have transferred the scene of their operations to Europe, and are making very profitable shafts and tunnels in the money bags of the capitalists of the old world. I know some of them who have gone there with mining claims, which they have represented to be worth millions of dollars, though not really worth ten cents, and they have returned to America with a goodly amount of capital.

I once heard one of these gentlemen tell his experience with a heavy capitalist in London. "The old fellow," said he, "was very cautious. I had a talk with him two or three times, and finally brought him some magnificent specimens. He looked at them very quietly, and then asked, —

"'How much of this stuff is there?'

"'O,' said I, carelessly, "any quantity of it. There are five or six thousand tons of it in sight — right on the surface of the ground. The vein is ten feet wide. We have a claim five hundred yards long, and we think it is at least two thousand feet deep, and the farther down you go, the richer it gets.'

"The old fellow took the specimens once more, and I saw his eyes glisten. I knew then that I had him. The next day I sold him the mine, and got the money. Once I had got it, you bet I took a train for Paris; and I have not been in London since."

## VIII.

### BURGLARS AND BURGLARIES.

REMARKABLE BURGLARIES. — UNDER GROUND FOR DISHONEST PURPOSES. —  
WONDERFUL ADROITNESS OF BURGLARS. — A REMARKABLE ROBBERY. —  
OCCUPATION OF A LAWYER'S OFFICE. — LABOR UNDER DIFFICULTIES. — A  
TROUBLESOME POLICEMAN. — STRANGE SCENE IN COURT. — THE CULPRIT'S  
REPLY. — ROBBERY BY COUNTERFEIT POLICEMEN. — THE OCEAN BANK ROB-  
BERY. — RAPID AND THOROUGH WORK. — AN ASTONISHED WATCHMAN. —  
BAFFLING THE POLICE.

LABOR under ground may be performed for a bad, as well as for a good purpose. It may be for dishonest gain, or it may be to secure a place of concealment for stolen treasures, or for those who steal them. In the performance of this kind of labor, men will frequently display ability and enterprise sufficient to insure them a good living and ultimate independence in an honest calling. They overcome obstacles of great magnitude; constantly risk their lives and liberty, and frequently fail to obtain any reward; their enterprises are hazardous; and where they promise great returns, they very often fail to redeem the promise. Men who plan great robberies frequently show the qualities that would make them prominent in an honest pursuit; they may spend half their lives in prison, when they might be honored and respected if they chose to be so; but they deliberately decide that honesty is not the best policy, and accept the career, which is certain to cover them with dishonor.

Some years ago there was a skilful and successful robbery of a jewelry store in Manchester, England. The store was entered between Saturday afternoon and Monday morning; the safe was opened and goods of a great value were taken; the occupants of the store had bought their safe only a few

months before ; it had been warranted fire and burglar proof, and they at once brought suit against the makers of the safe to recover the value of the goods that were stolen.

When the trial came on, one of the counsel stated that a man, then in prison for another offence, had acknowledged to a share in the robbery of the jewellers. With the consent of both parties the man was brought into court to testify to the robbery, and say how it was performed. As he entered the room everybody became silent, and all eyes were turned towards him.

They had expected a low, mean-looking fellow, with the face of a bull-dog, and the general appearance of a brute. Instead of such a man, they saw one whose bearing was erect, and whose face denoted intelligence. He took his place in the witness box, and when everything was ready he began his story. He gave the history of the robbery at length, and detailed each step of the proceedings. His manner was captivating, and at times he displayed enthusiasm and eloquence that would have fitted him for the position and honors of an advocate.

"We watched the store for more than a month," said he, "so as to learn the habits of everybody around it. We found they shut up Saturday, and no one went near the place till Monday morning, and so we fixed on Saturday night and Sunday as the best time to work. There was a lawyer's office over the store, and the lawyer went away about three o'clock in the afternoon, and didn't come back till ten the next morning. Sunday he didn't come at all, and so we were sure of him.

"We went into his office every day for a week before we went to work ; but of course we didn't touch anything. We laid out all our plans in his office, and smoked his cigars, and I will do him the credit to say they were excellent. As soon as he was gone that Saturday, we went into his office, took up the carpet, and then lifted the boards in the floor. We made a hole three feet square down to the laths and plaster of the ceiling of the jewelry store. Then we waited till the store

was shut; and it hadn't been shut five minutes before we had a little hole in the ceiling large enough to push down a tightly closed umbrella.

"We got the umbrella down, and then opened it, so that it would catch all the rubbish, and thus prevent our making any noise. When we were ready to go into the store, we had to arrange things so as to work systematically. We had laid all our plans for this beforehand.

"A gas-light was kept burning in the store, and there was a hole in the shutter, so that anybody could look in. A policeman passed the store once in every fifteen minutes; it was his duty to look in every time, and I can say for him that he did his duty. The man who was to work at the safe had to lie on his side in full view of the peep-hole; but by rolling over twice he could get under a counter and be out of sight.

"There were five of us in all. One was to work at the safe, with a string tied to his toe. This string was held by a man who sat on the edge of the hole in the lawyer's office. Then a man was at the lawyer's window, and another was walking up and down the opposite side of the street. The fifth man took turns at the safe, so that we should lose no time in resting.

"When the policeman was coming, the man in the street made a signal to the man at the lawyer's window. This one signalled the fellow at the hole, and pulled the string gently. The man at the safe then rolled under the counter; he staid there till the policeman had looked in and gone along, when the signals were repeated, and he rolled out and went to work again.

"We lost five minutes out of every fifteen in this way, and at one time we thought we should have to give up. We got into the safe, though a little after midnight; and then it didn't take long to empty it of all we could carry. We were out of the store by one o'clock Monday morning, and took an early train to London."

The burglar then went on to give a description of the process of opening a safe. He said that it was a rule with skilful

burglars that any safe could be opened, provided there was a place anywhere for the insertion of a wedge. "If we can get a wedge in anywhere," said he, "the safe is bound to open, even though the first wedge is no thicker than the blade of a knife.

"All we want besides proper tools is plenty of time, and there never was a safe manufactured that cannot be opened if you give us time."

He then described the advantages and disadvantages of the safes made by different manufacturers.

"A's safe can be opened by a skilful man in twenty hours; B's in fifteen hours; C's in eleven hours; D's in nine hours; and as for E's," mentioning one that had recently come into notice, "we consider it no more than an ordinary trunk, as we can open it in half an hour.

"There is no safe made that cannot be opened inside of thirty hours, and if we can be sure of not being disturbed for that time, we are certain of our game. Any safe will answer its purpose, provided the intervals of visiting the place where it is kept are never so great as the time required to open it."

As the man finished his story, and was taken from the court to go to prison, the judge asked him why he did not abandon burglary and live honestly. "Your story," said the judge, "shows that you possess sufficient intelligence and ability to make you a master mechanic in a very short time, and if you would lead a respectable life you could be sure of a good living."

The burglar turned to the judge, and replied with great earnestness, "I am as proud of my profession as you are of yours, and have no desire to leave it. I stand high in it, and the praise and admiration of my associates are just as dear to me as the praise and admiration of a shopful of mechanics would be to their master. Besides, we run risks that mechanics do not; we must have the skill to baffle the police, and save ourselves from arrest, while the mechanic needs nothing of the kind. The greater our danger, the greater is the respect shown to us; and one reason why we

love our profession is, because there is so much danger in it. And any skilful and experienced burglar will tell you so."

The man went back to prison to serve out his sentence for the crime of which he was convicted. Doubtless the notoriety he had obtained by his appearance in court was of great assistance in consoling him for his imprisonment. He was proud of his accomplishments as a burglar, and seemed to take his incarceration more as an honor than a disgrace.

In this country there have been several robberies of the higher sort, such as entitle the perpetrators to great praise for their skill, although it was shown in a bad cause. Among these may be included the famous Philadelphia Bank robbery, a few years ago, where the burglars actually informed the bank officers that an attempt was to be made against them. They proceeded in this wise:—

One afternoon, a little before the close of business hours, a man in the uniform of a policeman entered the bank and asked for the cashier. On meeting that official, he stated that he had been sent by the police captain of the precinct, whom he named, to warn them that there was reason to suspect that an attempt would be made that evening to rob the bank. He said an extra policeman would be detailed to watch the bank, and another extra man would be placed on the beat. The cashier thanked the man for the information, and told him to give his compliments to the captain. The man then departed, and the bank officers, after notifying their private watchman, closed the establishment and went home.

Of course the private watchman was on the alert, and kept a sharp lookout. About ten o'clock a policeman appeared, and asked if there had been any suspicious movements around there. The watchman said there had been none; and while they were talking another policeman appeared, and joined them in conversation. The first was the extra to watch the bank, and the second was the extra on the beat. The watchman opened the door of the bank, and allowed them to enter, so that they could see the approaching thieves without being seen.

THE PHILADELPHIA BANK ROBBERY.

When the three were fairly inside, there was a sudden change in the state of affairs. The door was closed, the watchman was knocked down, bound, gagged, and carried to the president's room, where he was seated in a comfortable arm-chair. One of the men drew a pistol and sat in front of him; the other opened the outer door, blew a small whistle, and in a minute half a dozen men, as nearly as the watchman could judge, entered the building. The door was closed behind them, and the party went at work to open the safe.

Swiftly, and as silently as possible, their work was performed. The watchman, from the place where he was bound, could not see, but he could hear, and he knew they were at work with drills, blow-pipes, wedges, and the other implements of the burglar's trade. Hour after hour passed, the watchman, bound and gagged, being guarded by his vigilant keeper. In telling the story subsequently, he said he was civilly treated by the man who guarded him. At his request the cords that held his arms were loosened, and the gag in his mouth was placed where it would least inconvenience him. Whenever he complained of thirst, his keeper gave him a glass of water from a pitcher in the room.

An hour or so before daylight the robbers opened the safe, and secured their plunder. Hastily packing it into the bags that had contained their tools, they departed, leaving their tools behind, and leaving the watchman securely fastened in his chair. He was ordered not to stir for an hour: bound as he was, he could not stir until some one came to his assistance, so that the parting injunction of the thieves was entirely superfluous. The amount of their plunder was never positively made known to the public, but was understood to be not less than two hundred thousand dollars—a very fair compensation for the work of a single night.

Of the many successful bank robberies that have taken place on this continent, the Ocean Bank burglary ranks among the foremost for its ingenuity and skill, and for being a complete puzzle to the most experienced detectives of the city of New York. Although an investigation by the police

authorities was begun within a few hours after the discovery of the robbery, no clew was ever obtained, or, at any rate, given to the public, of the perpetrators; and to this day the whole matter has been involved in mystery, and probably will ever remain so.

The maxim of war, that the reduction of every place, however strong, is possible, must be equally true in the art of thievery. It is evident that no vault can be made impregnable; no lock can be contrived by human ingenuity, with all its mechanical appliances, that will prove superior to other human ingenuity; no system of watching can make property entirely safe against the patience and acuteness of men who give good faculties to the science of stealing.

The premises occupied by the Ocean Bank were at the corner of Greenwich and Fulton Streets, New York, a locality much frequented by day and night. One would imagine that an attempt at robbery in this locality must be detected very quickly, provided the policemen and the watchers employed around the neighboring stores performed their duty. The robbery occurred between one and three o'clock on the morning of the 28th of June, 1869. It appears that there was no regular inside watchman employed by the bank, but they had an out-door man employed to watch the premises.

It is supposed that the robbery was planned many weeks before it took place, and one or more persons familiar with the thorough workings of the bank were suspected of being, to some extent at least, participators in the enterprise.

The basement of the premises in question was occupied by a Mr. William Okell, a gentleman well known in the city, and doing business as a broker. Having more room than he required for carrying on his business, he rented out several small offices for business purposes. In the early part of June, a man giving the name of Charles K. Cole, and representing himself as an agent for an insurance company in Chicago, engaged one of these rooms; and to him is given the credit of planning the robbery, in connection with others.

Immediately above the office rented to Cole was the

president's private office, and through the ceiling of this office an entrance was made sufficient to admit a man's body. From the subsequent examination by the detectives, it appears that holes were drilled through this ceiling from above and below, as the Brussels carpet in the president's room contained no holes, which would not have been the case had the drilling been done entirely from the basement.

It was urged by some that this drilling through the ceiling and large beams must have occupied weeks, while other experienced officers asserted that it could have been accomplished in a few hours. One of the severed beams was four inches thick by fourteen in width. Some believed that an entrance was effected through the side door, and that the person or persons had a good knowledge of the employees, where the safes were, the contents of the vault and safes, and the key to the combination lock.

The discovery of the robbery was made by the colored man up stairs, on Monday morning, when he opened the bank, in his usual way, to clean the offices. He detected a strong smell of powder, and went into the rear office to find out the cause of it. There he was astonished at the view which met his Ethiopian eyes.

On the floor of this office were the vaults and safes. Here he observed several caps of different descriptions, six or eight in number; overcoats, blouses, and overalls, such as are used by machinists; oil-cloths, rubber shoes, saws, bits, awls, jack-screws, drills, lanterns, and every other kind of implement used by expert thieves. The instruments were gathered together and taken into the possession of the police, and a cabinet of four hundred pieces was made of them.

The vault and safes were found to have been broken open; United States bonds were lying scattered about, as well as large quantities of coin and currency, mixed with which were small wedges, railway bonds, copper coin, augers, chisels, flasks of powder, any quantity of cigar stumps, which showed that the burglars took the situation very coolly, pieces of chilled iron, fuses, gold certificates, and other valuable securities.

Just outside the vault was placed a very heavy bag of gold, which had been lifted out ; but owing, probably, to its great weight, it was abandoned. Tin boxes had been burst open and thrown in all directions, as well as the securities which they had contained, and everything betokened the utmost recklessness in ransacking the safes. When all this disorder and chaos met the porter's gaze, he became half bewildered, and did not know how to act ; he thought he might be arrested for what had been done by others, and for a few minutes he contemplated flight. He had been through the rooms at one o'clock A. M., on the same morning, and found everything secure, so that it was plain the robbery had been done in a very short time. He, at last, raised an alarm that the bank had been entered, and in a short time Captain Steers, of the twenty-seventh precinct, took possession of the bank until the officers arrived.

When the robbery became known, the city was thrown into intense excitement, as it was rumored that over one million of money and securities had been stolen. The bank was quickly besieged by depositors and other interested parties, together with the usual assembly of curiosity-seekers. The depositors were perfectly uncontrollable ; and at one time it seemed that they were going to lay hands on money, or securities, found outside the vault, and make themselves secure against loss. The police, however, kept them at bay, and kept them out of the building. At length the bank officials appeared on the scene, in company with the bank's legal adviser ; and after a short time they issued a statement that only about twenty thousand dollars had been stolen.

This report kept down the excitement, but the depositors really did not know whether they were safe, or utterly ruined. The detectives took charge of the case, but, as stated at the outset, they were unable to cope with the matured plans of the thieves, and did not succeed in bringing any of them to the bar of justice.

The vault was in the president's room, at the rear of the premises. It was defended by an iron door, having a combi-

nation lock. This door was blown open with the gunpowder which had attracted the porter's attention. The door being opened, everything in the safe was accessible. The keys to the second door hung on the inside of the one that had been thrust open by the action of the powder, and it is hardly necessary to say that the thieves made good use of them.

The third door was forced open with a powerful screw, the force used being sufficient to depress the floor under the door. Here were two safes; one contained the securities of the depositors, and the other the property of the bank.

The boxes of the depositors appeared to be the principal attraction for the thieves, and paper securities were preferred to the gold which stared them in the face. These boxes were completely overhauled, and securities to the amount of about five hundred thousand dollars were abstracted; one depositor having lost as much as fifty thousand dollars, for which the bank was in no way responsible.

About thirty thousand dollars belonging to the bank, in checks and currency, were stolen. The thieves overhauled some thirty thousand dollars in Clearing House currency, which could have been negotiated, as well as thirty thousand dollars in gold coin; but which they did not touch.

The detectives went to work, and it was said that one or more of the bank's officials were suspected, and closely watched for some time subsequent to the robbery. Two men, who were said to be the most daring and accomplished bank thieves in the city, were suspected; but no trace could be obtained of their having been seen near the Ocean Bank. These men were supposed to have committed a robbery, just previously, at the National Bank of New Windsor, of something like one hundred thousand dollars. A number of expert English burglars had also arrived a short time before the robbery, but nothing could be brought against them.

On the third day after the burglary, a patrolman, in Elizabeth Street, about three o'clock A. M., met two young lads whom he knew. Suspecting they were up for no good at that hour of the morning, he spoke to them. They informed him that

there was a large trunk standing on the sidewalk, opposite No. 8 Elizabeth Street. He went to the number indicated, and there found the trunk, as they had described. On it was a card directed to Captain Jourdan (late superintendent of police), of the sixth ward. The trunk and the two boys were taken to the station-house.

When Captain Jourdan was summoned, and the trunk was opened, it was found to contain unnegotiable securities, to the amount of three hundred thousand dollars, which had been stolen from the Ocean Bank. The property consisted of bonds, checks, securities, and currency, together with legal documents, such as conveyances and mortgages; but no clew could possibly be obtained as to the sender of the trunk.

The total loss sustained by the bank proved to be about twenty-five thousand dollars, out of the bulk of the valuables and money stolen; but as the property returned to Captain Jourdan principally belonged to the depositors, their loss was estimated to be something near half a million of dollars.

The various implements found at the bank were valued at two thousand dollars, and were of the very finest finish; some of the pieces were worth as much as two hundred dollars, and three hundred dollars each.

Altogether, it was one of the most skilful, ingenious, and well-planned robberies ever committed in this country. The most singular part of the robbery is that, although an outside watchman was employed to guard the premises, no one was seen to enter the bank, or the basement of the building; neither was any one seen to leave the premises at any time of the night or morning when the robbery took place.

## IX.

### ADVENTURES OF DIVERS.

GOING UNDER WATER. — PEARL DIVING. — COSTUME OF THE DIVERS. — HOW THEY DESCEND. — OBTAINING THE PEARL OYSTERS. — DIVING-BELLS. — HOW THEY ARE MADE. — ADVANTAGES AND DISADVANTAGES. — ADVENTURES IN DIVING-BELLS. — SUBMARINE ARMOR. — ITS CONSTRUCTION AND USE. — A DIVER'S ADVENTURE. — A HORRIBLE SIGHT. — THE DIVER'S STORY. — A PEARL DIVER AND A SHARK. — A NARROW ESCAPE. — STRATEGY IN THE WATER.

To go under the water is pretty nearly as difficult as to go under the earth. Man is not made to live in the water, although he has been known to pass many hours there without touching land. A great many persons seem to have a dread of water in any shape. They rarely bathe, and never drink the liquid when they can obtain anything stronger. It frequently becomes necessary for men to go beneath the surface of the water, exploring the wrecks of ships, and searching for valuable things that are to be found with a varying quantity of fathoms above them. In the East Indies, and in South America, and other parts of the world, the primitive form of diving without any apparatus whatever has been popular for many hundreds of years. The pearl divers of the East are dressed in a costume somewhat resembling that of the famous Greek Slave, minus her fetters. The diver, when preparing to go below, arms himself with a pick, with which to break away the pearl oysters. He is provided with a stone weighing forty or fifty pounds, and attached to a rope several feet in length. Filling his lungs with air, he grasps the rope in his hand, and then jumps from the side of the boat into the water. The weight of the stone carries him down. When he reaches the bottom, he detaches the oysters from the rocks, places them in a bag at his side, and then rises with

his prize to the surface. Ordinarily he does not remain more than a minute, or a minute and a half, below the surface, though instances have been known of pearl divers who would remain as long as four or five minutes under the water. Of course he can only remain as long as the air which has been taken into his lungs will last him, and every one who tries to hold his breath knows that this cannot be for a long time.

The diver generally closes his nostrils with a split stick, or something of the sort, to prevent the entrance of the water, and he is very careful to keep his mouth tightly shut. Water and air do not mix well in one's lungs, and no man has ever yet invented a system of breathing water instead of air. At the depth to which the pearl diver descends, the pressure of the water causes a very unpleasant sensation in the ears, and before he has made many subaqueous journeys the drum of the ear is generally broken. The breakage of the ear-drum causes no serious injury beyond rendering the person who has undergone it hard of hearing, and instances have been known of divers becoming entirely deaf in consequence of the injury to their ears.

As an improvement upon the primitive form of diving, the Diving-Bell was invented. It is called a bell on account of its shape, and not in consequence of any sonorous quality. It is constructed in the general shape of a bell, or an inverted tumbler; it is lowered, mouth downwards, into the water by means of ropes attached to a ship, a boat, or the arm of a derrick projecting over the water. Generally, however, it is let down from a ship's side. The earliest diving-bells had no arrangement for supplying them with air. After the quantity within the bell was exhausted, the diver gave a signal by means of a rope, and the bell was drawn to the surface. At present the diving-bell has a flexible rubber tube attached to it, by which it is constantly supplied with fresh air, so that a diver may remain several hours under water without suffering for want of a pure atmosphere. The foul air is let out through a valve in the top of the bell, and is constantly rising in the shape of little bubbles. The pure air is forced down by

PEARL DIVING IN THE EAST INDIES.

means of a pump, which must be kept in steady operation. As long as this pump is at work, and the bubbles are rising from the bell, those above can be assured that everything is satisfactory; but let the bubbles cease to rise, and it is instantly known that something is going wrong.

As the bell descends below the surface, the pressure of the air becomes very great, being equal to the pressure of the water. A dense atmosphere of this sort has many peculiarities. It is easy enough to breathe, but the pressure on the drum of the ear is frequently inconvenient. An ordinary whisper will sound as loud as the customary tones of the voice, and if there are two persons in the bell, and one of them speaks as he would naturally speak in the open air, he will seem to the other to be shouting with the full power of his lungs. A slight blow upon any metallic substance within the bell will sound like a very heavy one, and any noise that would cause no inconvenience in the open air may become absolutely painful in the dense atmosphere in the inside of a diving-bell.

A diving-bell must be made very heavy to carry it downward, and large weights are generally placed around its mouth. A shelf inside serves as a seat for the occupant, and when it is lowered to the bottom, the ground can be leisurely surveyed or examined for whatever object the diver has in view. Sometimes, when two persons descend in a bell, one of them may leave the bell by diving into the water, and then returning, but he cannot go very far. Submarine armor, however, enables him to go quite a distance away from the bell, and return at his leisure. Submarine armor possesses many advantages over the ordinary diving-bell. A man encased in a submarine suit can remain under water for a long time, and move about pretty much as he likes.

Submarine armor consists of a water-proof suit, completely encasing the body of the wearer. It is put on in two sections; the trousers have shoes attached to them, with heavy leaden soles, and at the waist they are firmly fastened to a metallic ring. The upper part of the suit covers the arms, the head,

and the chest, and the lower part of it is fastened to a ring which exactly meets the other. The upper part of the suit is put on, and after it the second, or lower part. The two rings are then fastened together by means of screws, and a thin band of rubber upon them excludes both air and water. The head of the diver is enclosed in a helmet made of brass or other metal, and having a thick plate of glass in front. Air is conveyed inside this helmet by means of a rubber tube, and an air pump must be kept in constant operation, to supply the man in armor with the necessary amount of air. The foul air escapes through a valve in the top, just as it escapes from the top of the diving-bell. A suit of clothing of this sort does not add to the beauty of its wearer; it is very cumbersome, and I greatly doubt if it ever becomes fashionable for an afternoon promenade on Broadway. The helmet might answer very well as a disguise, for the reason that the face of the wearer is almost, and generally quite, invisible.

When a diver is properly encased in his armor, he is swung off from the side of the boat or ship, and sinks into the water. The leaden soles upon his shoes carry him straight down, and serve to keep his feet in the proper place and position. The tube supplies him with air, and he can walk about and use his hands freely. He can handle the pick and shovel, and can enter the cabin of a sunken ship; in fact, he can go in any place where the flexible tube can be made to follow; but all the time he is below, the pump must maintain a steady motion, and the valve in the top of his helmet must work freely. A slight accident may cause his death: should any of the machinery of the pump give way, or some careless person on the ship step upon the tube as it lies along the deck, the diver might lose his life. It sometimes happens that on being drawn to the surface the diver is found dead. Some slight accident has cut off his supply of air, and cutting off the air has deprived him of life.

Sunken ships have been explored by means of this diving armor, and sometimes large amounts of treasure are recovered through its use. In some cases miners have prosecuted their

operations under water by means of this apparatus. A few years since an expedition was fitted out to examine a wreck of a ship which was sunk more than half a century ago on the coast of South America. She was known to have a great deal of treasure on board. Operations had been undertaken frequently by means of common divers and diving-bells to recover this treasure, but none of the enterprises had been rewarded with success. With their submarine armor to aid them, the new explorers were successful, and were handsomely rewarded for their efforts.

Thrilling stories are told by men who have thus gone below the surface of the water. Some time ago a diver was sent down to examine a steamer that had been sunk in about sixty feet of water, and had carried down many of its passengers. The man went down, and made two or three efforts without success to enter the cabin of the vessel. On the fourth visit he accomplished his object, and reached the cabin. Soon he made a signal to be drawn up. When he was on the deck of the ship, and the armor was removed, he fainted. When he recovered, he was asked the cause of his faintness, and replied,—

“It’s enough to make any man faint to see what I have seen. I went into the cabin of that ship; it was full of water, of course; but that wasn’t all. It was full of the bodies of those passengers that went down when the ship was lost. There was a slight motion of the water, caused by the ground swell; and, as I entered the cabin, the water slowly swayed backward and forward, and swung these bodies with it. At the very door one of them brushed against me, or rather rolled against me, and its dead, glassy eyes stared directly in the face of my helmet, not six inches away. I knew it was dead, but there seemed to be a life-like expression in that cold and stony face. I passed by it, and had gone but a few feet before I encountered another body; and as I looked along the cabin, the vessel, being slightly careened, received a dim light through its windows. Those bodies swinging with the motion of the water seemed more like living than like dead

forms. There was a combination of life and death in their paleness which was absolutely horrible; and not for all the treasure this ship contains will I go down again."

The diver positively refused to repeat his descent, at least in that part of the ship; but others, less sensitive than himself, were found to go down and complete the exploration. None of them, however, appeared anxious to continue on that sort of work, and all were heartily glad when the exploration in the cabin was completed.

The life of a pearl diver is full of adventures. The pearl oyster is found only in warm countries, or, at all events, very rarely in cold countries. The parts of the sea where these oysters are found are generally frequented by sharks. The sharks have a great fondness for divers, but it can be readily understood that the divers do not reciprocate the fondness of this finny tribe. Nothing is more pleasing to the shark — that is to say, an old and well-educated shark — than to make a breakfast off a pearl diver. The diver objects to this little arrangement, and remonstrates with the shark; but the latter doesn't heed his remonstrances, unless they are of the most positive character.

Before going below, the diver generally scans the water very carefully, to see whether any of his man-eating friends are around and ready to welcome him. When he has reached the bottom, finished his labor, filled his bag with oysters, and is ready to ascend, he always takes a good look aloft, to see that no shark is waiting for him. The shark does not pick up the diver at the bottom; he makes no attack as long as the man is beneath him, but watches his chance, and as the man goes upward he makes a sudden dash, and considering the diver a stranger, takes him in. It is not unusual in the pearl diving regions to hear of men who have suddenly disappeared while below; and the inference always is, that these men have been quietly and calmly eaten. A pearl seeker whom I met some years ago while on a sea voyage told me an exciting story of an adventure with a shark in the pearl regions not far from Panama.

"I had in my employ," said he, "about a dozen divers, very active, athletic fellows, who did their duty faithfully, stole all the pearls they could when my back was turned, and sometimes, unless I was very watchful, they reduced my returns very materially. I had a curiosity to learn the peculiarities of pearl diving for myself, and so engaged one of the professional divers to teach me. Well, he taught me.

"My first duty was to strip off all my clothes, swing a bag over my shoulder, take an iron rod about two feet long and sharpened at one end with which to detach the oysters, seize a stone, and after fastening my nose so as not to take in any water that way, I jumped overboard and followed the diver below.

"The water was about thirty feet deep, and the first time I went down I could do nothing but come back again. I didn't bring any oysters that time. The next time I went down, I managed to get half a dozen oysters, and then I came up. Well, after a while I got so that I could get my bag half filled on each descent, and began to think that I was a very fair diver. I did not do much of it, though. Half a dozen times a day were all that I was willing to try. My ears stood it very well the first day, but the second day I went down deeper and staid rather longer than at any previous time, and when I came up my ears were bleeding, and I felt as if there was at least a barrel of water in my head. That was enough for that day; but the next morning I felt all right, and tried it again.

"Always before I went down they cautioned me to look out for sharks. 'Never stir from the bottom,' said one of the men, 'until you have looked up to the top, and find everything is clear above you.' I remembered his advice, and it was well that I did so. About ten days after I had begun to learn the business, I went down as usual, picked up some oysters, put them in my bag, and was starting to go up. I gave my usual look above, and there I saw a big shovel-nosed shark watching me. He was evidently calculating that he had me sure, and considered me as good a breakfast as he wanted. I did not

like his looks, and what to do I did not exactly know. I would have much rather been in the cabin of my schooner than in the stomach of that fellow. My first impulse was to dart up beneath him, and follow the custom of the natives. Generally when one sees a shark, and can't get off in any other way, he rises as rapidly as possible beneath the fish, and sticks the iron rod into his belly. This is a treatment for which the shark is not prepared, and unless he is over-hungry he will generally go away. Sometimes, though, he shows fight; and when it comes to a struggle it is very fierce. The shark is in his natural element, but the man is not in the element to which he is most accustomed, and if the shark is large and persistent he generally wins.

"I did not consider myself up to the emergency of stabbing that fellow with my rod, and thought I would take the chance of going by him. But that was of no use; he would have taken me in as I reached the surface, just as a trout takes in a fly. In an emergency like mine, men think, and they must think very rapidly. I do not believe that I ever thought with more rapidity in all my life. The place where I had been gathering oysters was at the side of a large rock, and I had not left it when I saw the shark. I moved quietly to the other side, thinking to dodge him.

"He saw my movement, and immediately swam over the rock, and placed himself above me. Well, what was to be done next, and what do you suppose I did? You know there is a little fish called the cuttle-fish. It is not much of a fish; it is not handsome; it cannot swim fast, and is not heavy on the fight. When pursued it throws out a sort of inky substance, which blackens the water and makes it sufficiently cloudy to enable the cuttle-fish to escape. It carries this ink in a bag, and keeps it laid up ready for use. Perhaps you might call him a marine editor; that is, the sort of editor that does not fight, but defends himself by slinging ink in the face of his adversaries.

"I was not in a condition to fight, and so I quickly thought I would play cuttle-fish. On one side of the rock the bottom

was a sandy mud, and I immediately conceived the idea of stirring up this mud, thickening the water, and so making a cloud, behind which I could escape. With my pick I stirred the mud, and in less than ten seconds I had the water all around me very thick and cloudy.

"Then I slipped back to the other side of the rock, and went above. I reached the side of the boat with just strength enough to lay hold of it. The men saw that something was wrong, and they instantly seized me, and pulled me on board. They had become alarmed at my long absence, as I was under water nearly twice the time I had been at any previous descent.

"Well, this is not the whole of the story. If I should take off my boot — the right one — you would see some very ugly scars on my foot. That shark watched the water where I was, and just as I reached the surface, and was being pulled into the boat, he discovered me. He darted for me, whirled on his back, — sharks always have to turn on their backs to seize their prey, — and tried to take in my foot.

"The men saw him coming, and they pulled me in about as fast as any man was ever pulled into a boat. That shark did not get me, as, of course, you believe, but he did get hold of the end of my foot. Two toes are gone, and the others are pretty well scarred. If he had made his dive at me one second earlier, I do not believe I should have had any foot on this leg to boast of. Confound these sharks, any how. They do not respect a white man at all, or half as much as they do a brown-skinned native.

"Take a lot of sharks when they are not particularly hungry, and a lot of niggers may swim around them, and they will be as sociable as if they belonged to the same family; but just let them see a white man in the water, and they will take him in as readily as a bull-dog would take in a beefsteak.

"I have been some time telling this story to you, but the whole occurrence did not consume more than two or three minutes."

## X.

### EXPLOSIONS IN MINES.

**THICKNESS OF COAL SEAMS. — STUPIDITY OF A TURKISH MINING SUPERINTENDENT. — THE RESULT. — BLASTING IN MINES. — HOW IT IS DONE. — TERRIBLE ACCIDENTS. — MINES ON FIRE. — SCENES OF DEVASTATION. — EFFECT OF SUBTERRANEAN FIRE. — EXPLOSIONS OF FIRE-DAMP. — HORRIBLE ACCIDENTS. — STORIES OF SURVIVORS. — LOSS OF LIFE. — SCENE IN A WELSH MINE. — EXPLOSIONS IN ENGLISH AND AMERICAN MINES. — MODES OF RELIEF. — STORY OF TWO BROTHERS. — HOW THEY WERE SAVED. — THE SAFETY-LAMP. — ITS CONSTRUCTION. — THE FIRE-WALLS OF CHINA. — THE PENITENT AND CANNONEER.**

**AFTER** the shafts have been completed and the levels opened in the mines, the work may be said to be fairly under way. The seams of coal are of varied thickness. Sometimes, though rarely, there will be found a coal seam of thirty feet in depth, sometimes one of twenty, and so on down to two and three feet. A seam of three feet in thickness is considered a valuable discovery, and oftentimes the seams do not exceed twenty inches. In the deep coal seams the work is comparatively easy, as the space in the level can be hollowed out the full depth of the seam, and all that is necessary for supporting the roof is to leave a sufficient number of pillars standing.

There is a coal mine in Turkey where the seam is about ten feet thick. A superintendent, entirely ignorant of the business, was sent to take charge of the mine. On his first visit to the mine the men were below. He observed the pillars which were left to support the roof above. He gave one glance at them, and then turned to the workmen and said,—"Remove those blocks of coal instantly: this mine has not been worked properly."

With that blind obedience peculiar to the Orientals, the

(140)

men immediately knocked away the pillars, when down came the rock, killing half the men in the mine, and among them the stupid superintendent, who had ordered the removal of the supports.

There are many dangers and difficulties to be encountered in opening a coal seam. The ordinary mode is to dig away the coal from the lower part of the seam, and allow the substance to fall down in large blocks. To perform this work the miner must lie on his side, frequently in a hot temperature, and in this position he digs away with his tools. It is not unusual for the coal to fall upon him, sometimes injuring him seriously, and sometimes killing him. In his work the miner is frequently stripped to his trousers and shoes, and sometimes he works entirely nude. The perspiration streams from his face and from his entire body, and he is unable to continue his labors for any extended period of time.

Sometimes the coal can be removed by means of tools, without the necessity of blasting, but very often it is necessary to employ the force of gunpowder. The rock is drilled, and then the charge must be placed in the hole. There is always more or less danger of premature ignition of a charge, and in consequence of such ignition, men are frequently killed.

The most dangerous place for blasting operations is in the shaft. The men can only retire after the charge is lighted, and when this is done it is imperatively necessary that they should be drawn up with all speed.

One day, at a mine in Pennsylvania where a shaft was being sunk, the men had lighted the fuse and given the signal to be drawn up. Somehow, just as the bucket was started, some of the machinery gave way, and the men remained at the bottom of the shaft. The fuse was slowly but steadily burning, and there was no time to be lost. One of the men jumped from the bucket and cut off the fuse when it had burned to such a point that another moment would have rendered the explosion inevitable.

A safer way than using the ordinary fuse, is to fire the

charges by means of electricity. This method, however, is not always practicable, owing to the expense and the difficulty of employing it in small operations.

Nitro-glycerine, which was invented in 1847, has been found to possess many advantages over gunpowder, and the day is not far distant when it will be used for all blasting operations on an extensive scale.

The firing of gunpowder and nitro-glycerine is not the only source of danger which threatens the miners by fire. There is frequently in coal mines a spontaneous combustion, produced by the heating of fragments of coal from the decomposition of iron pyrites in contact with moisture. When the small coal of certain mines is left in heaps within the mines, they speedily undergo this decomposition, especially in a moist atmosphere, which is accompanied by a great development of heat.

In such cases walls of clay are built up to shut off the fire. When these are constructed perfectly tight, and the atmosphere is carefully excluded, the fire goes out; but for some time the temperature in these parts of the mine will be very great, and the miners find much difficulty in working there. The work of building up the walls in such a case is very serious. The walls become very hot, and men are frequently rendered insensible. Sometimes carbonic acid gas has been used to extinguish fires created in this way. The portable apparatus known as the Fire Extinguisher has frequently been found very useful.

Sometimes, however, it is impossible to extinguish these fires; and in such cases the place is abandoned. In this country, and in England and Scotland, there are mines now burning which have been on fire for several, and some of them for many, years. One mine in Scotland took fire nearly forty years ago, and is still burning. The ground is black, baked, and scorched. The trees, and grass, and all kinds of vegetation have died, and there is a general appearance of sterility throughout the region.

In several instances, where a fire cannot be extinguished by

closing the mines, it has been found useful to flood the works. In France, about twenty years ago, an entire river was turned into a burning mine, and allowed to flow through it for nearly three months. A mine in Pennsylvania took fire, and was filled with water, remaining so filled for nearly half a year before the fire went out.

At Brul , St. Etienne, there is a coal mine which has been on fire nearly two hundred years. Hot vapors are constantly arising; sulphur, alum, and other natural productions are deposited, and one might suppose that it was the burning of the accursed cities formerly consumed by the fires of heaven and earth. An irreverent American, who visited this region, said that it looked like hell with the fires going out.

In the western part of England there was formerly a coal mine on fire. Snow melted as soon as it touched the ground. The gardens were very beautiful and fertile, and produced three crops in a year. Many hot-house plants were cultivated, and an eternal spring prevailed. It was the same principle, on a grand scale, by which plants are grown in hot-houses by running pipes of hot water through the ground. The people of this region imported tropical plants at a heavy cost, and cultivated them in the open air; but one day the fire went out; the place gradually resumed its usual temperature, and the tropical plants died.

In many coal mines there is great danger from what the miners call "fire-damp"—an inflammable gas produced from the coal. It is identical with the streams of natural gas, which burn readily, and not unlike the coal gas artificially produced in cities. Certain kinds of coal throw off this fire-damp in considerable quantities. The gas is a combination of hydrogen and carbon. Sometimes its presence is not noticed until an explosion, but in such cases the explosions are not very dangerous. Those who have been accustomed to this explosive material have received a vivid experience of underground life. No meteor, however terrible it may be supposed to be, can be compared to an explosion of fire-damp. A thunderbolt, a hurricane, a typhoon, a cyclone, or a

whirlwind, is not more terrible in its effects than a fire-damp explosion. Imagine a discharge of a hundred cannon loaded with canister shot, the simultaneous explosion of a number of powder magazines, or the bursting of the boilers of a steam engine, and the effect will not be more terrible than an explosion of fire-damp in a coal mine.

The moment the gas comes in contact with the flame of a lamp, its tremendous explosive force is revealed, and it penetrates into every quarter of the mine. In an explosion of this kind everything is shattered far and near. Horses, men, doors, machinery, and everything else lying in its course is overthrown, and sometimes heavy machinery at the top of the mine is blown away. Dense clouds of smoke, and frequently masses of coal, stone, and timber, are sent flying from the shaft high into the air. The very ground shakes as if moved by an earthquake, and the general appearance of the shaft is not unlike that of a volcano in a state of eruption. Streams of water are sent into the air, and not a pane of glass for a long distance around remains unbroken; and to these horrors must be added the great confusion and alarm of the people, the wailing of the women and children whose nearest friends have perished, and even then the terrible picture is incomplete.

The stories of these explosions would fill volumes. In one mine three hundred and sixty men at one time were killed, in another two hundred, in another one hundred, in another fifty, in another twenty, in another sixty, eighty, and so on, through mine after mine, till the deaths from fire-damp could be numbered by thousands. Not those alone who are in the wreck of the explosion are the victims.

At a Pennsylvania mine a few years ago, a dozen men were at work in one of the galleries, and heard an explosion in a portion of the mine some distance away. They rushed to the shaft, and attempted to escape. Before the bucket was lowered to remove them, the choke-damp, developed by the explosion, overtook them, and the whole party were suffocated. Hundreds of stories might be related of explosions in coal mines. One of them will be sufficient for the present.

EXPLOSION OF FIRE-DAMP.

At one time, in one of the English mines, forty men were at work. At the mouth of the shaft there were a dozen or twenty men, when suddenly there was a loud report, like an explosion. It was at first supposed to be the bursting of the boiler; but a moment's observation showed that the fire-damp had become ignited. The masonry at the mouth of the mine, and all the machinery above it, were blown away. At the moment of the explosion, a tub filled with coal was being hoisted up. It was a hundred feet or more from the surface, and it was blown into the air as if it were a bullet fired from a gun. The fragments fell around the mouth of the shaft, injuring several of the men who were there.

When an explosion occurs, the miners, and all attached to the establishment who may be above ground at the time, are ready to go to the relief of their comrades. In the present instance a relief party was organized at once. A pulley was rigged over the mouth of the shaft, and two men entered a bucket to be lowered down. They had not descended fifty feet before their lights were extinguished, and very soon they made a signal to be drawn to the surface, both of them being in a condition bordering on suffocation. They were ill through the night, and one of them did not recover his strength for several days. A second attempt was made, and resulted in nearly the same way. The lights were extinguished, and the men drawn up in a suffocating condition. The galleries seemed to be full of choke-damp, and it was almost certain that no one could be alive in the mine. A hose was lowered, and pure air was pumped into the mine. This work lasted three or four hours, and then two others descended and succeeded in reaching the bodies of some of their companions; but in the attempt one of the rescuers fell dead, and the other was nearly suffocated.

More air was poured into the mine, and it was then twenty-four hours from the time of the explosion before the explorers thought it safe to enter. Every man who was below at the time of the explosion was killed. At the stables near the foot of the shaft a horrible scene was presented. According

to the indications, three of the men were in the stables, taking care of the horses, at the moment of the explosion. The stables were thrown down, the men and horses were covered with the fallen debris, and death by suffocation seemed to have ensued in a very short time.

At the end of the gallery, where the explosion had taken place, the bodies of the men were found in some cases hardly scorched, while in others every particle of clothing had been burned away. In some instances the bodies were so baked that they could not be recognized.

Around the mouth of the pit the families of the miners were congregated. As each body was brought to the surface, there were shrieks and loud lamentations that could be heard for a long distance. A more terrible sight cannot be seen in the whole world, than at the mouth of a mine shaft after an accident of this kind.

A story is told of an explosion, in one of the Welsh mining districts, which caused the death of forty-seven men. Only two men that were below at the time escaped with their lives. These men were brothers. When the explosion was heard, one of the brothers rushed towards the other, who was a short distance away. A second explosion followed, more severe than the first, and threw the men down. Both were stunned, but they gradually recovered their senses, and were able to move. The air was thick and hot, and they could only move with great difficulty. The older brother had his can of tea, and bathed their faces with the liquid, so that they revived. Supporting each other, they tried to reach the entrance to the mine. They crawled on their hands and knees in the midst of darkness, over the bodies of their late companions, some of whom were still breathing, while the rest were silent and dead. After many narrow escapes, they reached the end of the gallery, near the shaft, and were saved.

An apparatus has been invented by which a man can enter places filled with choke-damp, either to carry aid to suffering men after an explosion, or to make explorations. A bag, or case of leather, or metal, is carried on the back, into which

air has been driven under a heavy pressure. A rubber tube extends from the bag, and is fastened to the mouth and nose. It is furnished with two valves, one opening inward, to carry the air to the lungs, and the other outward, to carry off the air after it has been breathed. For long journeys extra bags filled with air may be taken. Some of these reservoirs, made of sheet iron, will resist a pressure of thirty or forty atmospheres. Another apparatus, fastened to the back, like a soldier's knapsack, has a kind of valve, placed above the reservoir, allowing the air to enter the lungs at the ordinary pressure only.

A similar apparatus is made by filling an air-tight goat-skin with air. The same kind of tubes are employed, and sufficient air can be carried to last the bearer fifteen or twenty minutes.

To guard against gas explosions, Sir Humphry Davy invented a safety lamp. He protected the flame with wire gauze, on the principle that flame cannot be made to pass through a tube, however short, unless it is driven through. The wire gauze is in fact a number of short tubes close together, and thus, while the explosive gas may pass through, the flame cannot do so.

An improved lamp of this class has a glass cylinder around the flame, with gauze at the top and below. The glass is protected by stout wires. A great many forms of these lamps are in use in mines, but all are constructed on the same principle. By the use of this safety lamp, many mines that had been abandoned were reopened; and Sir Humphry Davy is regarded as one of the greatest benefactors of this age. His lamp might well be called, like Aladdin's, the Wonderful Lamp.

Sometimes, when fire-damp is very abundant, and is steadily given out, it is utilized for lighting purposes; the gas is collected, and by means of a pump a jet of gas is poured from a tube and is ignited. One of these jets has been burning for more than twenty years in an English coal mine. In the same mine the gas was collected in pipes, and carried outside, where it was used to run a steam engine.

A French traveller has given a vivid description of the famous fire-wells of China. He says that where the air escapes it is very inflammable, and if a match is presented at the mouth of the shaft, the gas explodes like gunpowder, and forms a great column of fire twenty or thirty feet high.

He says the largest fire-wells are situated in the mountains about one hundred miles from Wutung. They are in a valley, where pits were sunk in the hope of finding salt water. The water was not found; but suddenly a column of gas rushed out, bringing masses of earth and stones. The noise was terrific, and was heard a long distance. The mouth of the pit was surrounded by a stone wall six or seven feet high. As soon as the fire reached the mouth of the well it caused a terrible explosion, something like an earthquake. The flame was several feet high, and the force was sufficient to throw down some of the stones composing the wall. Several men carried a large flat stone to the pit, and placed it over the mouth. It was immediately thrown into the air, and some of the men were badly injured.

Neither water, stone, nor earth would extinguish the fire. After two weeks of hard work a quantity of water was brought over the mountains from a small river, and a lake was formed. The water being suddenly turned into the well, the fire was extinguished.

In some mines it is the custom, where the accumulation of fire-damp is gradual, to light it every night, so that the works may be always accessible in the daytime. The man whose duty it is to light the fire-damp wraps himself in a thick blanket, covering his face with a mask, and with his head enveloped in a hood like a monk's. The fire-damp is lighter than the atmosphere, and always rises to the upper part of the level. Consequently the man crawls upon the ground in order to put himself in the best position for breathing. In one hand he holds a long stick, with a lighted candle fixed at the end.

He pushes the stick to its full length, and creeps along, firing the gas; and as soon as he has fired it he changes his position, and walks upright, since the fire-damp is always fol-

lowed by the choke-damp, which is heavier than air, and sinks to the bottom.

In the French mine this man is called a *penitent*, on account of his dress resembling that worn by some of the orders of the Catholic church. His name sometimes would seem to be a cruel jest, as he is liable to be blown away by an explosion, and never return alive. In other mines he is called the *cannoneer*, and when the fire-damp kills him he is said to have died at his post.

## XI.

### A DAY IN POMPEII.

**A VISIT TO POMPEII. — NEAPOLITAN HACKMEN. — AN INTERESTING ADVENTURE. — HOW TO AVOID A QUARREL. — BEGGARS. — BEGGARY AS A FINE ART. — A PICTURESQUE SCENE. — MAKING MACARONI. — TRICKS OF AN OLD ROOSTER. — POMPEII. — ITS HISTORY. — DISCOVERY OF THE BURIED CITY. — A SCENE IN THE STREETS. — AN ANCIENT BAKERY. — HOW THE MILLS WERE TURNED. — INVESTIGATING AN OVEN. — A WONDERFUL DISCOVERY. — PRESENT CONDITION OF THE HOUSES. — ADVERTISING IN OLD TIMES. — POMPEIIAN PERSONALS. — A PICTURE OF THE DESTRUCTION. — OBSCENE OBJECTS IN THE CITY.**

ON a pleasant spring morning several years ago, I started from Naples to pay a visit to the ruins of Pompeii. Our party consisted of four persons; and our first work was to engage a carriage, as we thought the carriage road would be preferable to the railway. Engaging a carriage in Naples is a tax upon the patience equal to some of the trials which were visited upon Job. I am not quite certain that Job would have remained patient after a contest with Neapolitan hackmen. Boils would be nothing compared to it.

One of the school-books that I studied in my younger days made the assertion, "A horse is a noble animal." I do not question the nobility of the horse, and his possession of blue blood; but of one thing I am certain, and that is, a great majority of those who associate with him are the reverse of noble. Hackmen, all the world over, are proverbial for dishonesty. Horse-jockeys are never mentioned as types of human perfection; and the history of the race-track is the history of a great deal of fraud. If the horse is a noble beast, it must be that his nobility and excellence of character develop the opposite qualities among his human intimates.

Hackmen are bad enough everywhere; but I think the per-  
(152)

fection of badness is to be found among the hackmen of Naples. They will lie with the most unblushing impudence ; and if they receive any future punishment for telling untruths, their roasting will be perpetual. The day before our journey to Pompeii, we had chartered a carriage to take us to the Sibyl's Cave, and the other curiosities in the neighborhood of Pozzuoli. We made a positive bargain with the driver, including the amount which he was to receive as drink money. I believe we were to pay twenty francs for the carriage, and two francs for drink money. When we returned and were settling the bill, he swore by all the saints in the calendar, — and he named every one of them, — that we agreed to pay thirty francs for the carriage, and ten francs for drink money. He took his hat from his head in his rage, and threw it upon the ground, pulled his hair, and made things in general very unpleasant. He called several unwashed Neapolitans to witness that no carriage was ever hired at a lower rate than the one which he insisted was our contract price.

We found that we could not reason with him ; and so we lighted our cigars, and waited for his paroxysm of rage to come to an end. We finally compromised the matter by paying twenty-five francs for the whole business ; that is, we compromised by handing him the money, and walking away. He followed us two or three blocks ; in fact, he stuck to us until we entered our hotel, and there we lost sight of him.

The hackman who was to take us to the buried city might have been useful, but certainly he was not ornamental. He was covered with dust, so that he resembled a walking ash-heap ; and as for washing, I do not think he had ever experienced its terrors. Judging by the odor which arose from his skin, he had been put through some embalming process, in which garlic was the preservative substance. He resembled a sponge which has been dipped in garlic water, and kept without squeezing. His clothing was of all sizes except his own. His trousers were made for a man twice as large as he ; and his coat for one of about half his dimensions. His face was as prepossessing as a basket of old bottles ; and as for his manners, he did not appear to have any to boast of.

I spoke to him in French, which he pretended to understand, but could not comprehend. He answered in a mingled *patois* of French and Italian, in which there was no French to speak of, and very little Italian. I forget the exact sum we agreed to pay, but think it was altogether about twenty-five francs.

I may as well explain here, that on our way back we invented a new plan for paying him, and at the same time avoiding trouble. When we neared the hotel on our return, I counted out the money in francs and half francs, and threw in a few copper coins by way of adding to the confusion. With the proper amount in my hand, I stepped from the carriage, and waited until my three companions were a dozen yards away; then I dropped the money into the hands of the driver, and started at a rapid walk to overtake my friends. Before he had finished counting the money we were inside of the hotel. As we walked up stairs, I heard a volley of Neapolitan and French oaths following us into the building, and rolling through the hall like a small cloud of smoke.

We started from Naples in the direction of Vesuvius, passing through several villages on our road to Pompeii. The road was excellent, being paved or macadamized the entire distance, and ornamented with houses and beggars in about equal proportions.

The beggars deserve great credit for the study they have devoted to the perfection of their art. Sores are cultivated as a handsome man would cultivate his mustache; and as for a withered leg, it is worth a fortune to its possessor. Every time our carriage halted, the beggars surrounded it, as flies in July surround a lump of sugar, and pretty nearly for the same reason, as they wanted something on which to exist. They accosted us in two or three languages, Italian of course predominating. We told them, in French, in English, and in German, to go away, and that we would give them nothing; but they stuck to us with the most unruffled pertinacity. They had heard all that before, and knew that if they were adhesive, they had a good prospect of extracting something. I tried a new plan on them, and found that it worked well.

Assuming an air of great indignation, and with as much severity in my face as I could command, I addressed them very loudly, with my hands extended, in Russian and Chinese. Those languages were new to them, and fearing that it was some horrid imprecation, several of them dropped away. I afterwards found the plan quite successful, not only with Italian beggars, but with beggars of every nation. Tell them in any language to which they are accustomed, that you will give them nothing, and, if you are so minded, consign them to the infernal regions, and they do not mind it; but if you assume a priestly attitude, and utter something very solemnly in a language they do not understand, you have a fair prospect of getting rid of them.

At one place, on the road to Pompeii, there is a small hill. From the foot to the summit the distance is not more than one to two hundred feet; but the slope is so steep, that horses, in ascending it, do not travel faster than a walk. At the foot of this hill, four beggars — middle-aged women — were located; and they evidently had purchased a monopoly, or possibly a grant from government for the possession of the spot. In front of a small wine shop they had erected a pavilion, and each of them had a comfortable chair. They watched the place, and attended closely to business during the entire day. When they saw a carriage approaching, they left their chairs, and proceeded to the road, adhering closely to the vehicle until it reached the top of the hill. They begged persistently until they received what they demanded, or the top of the hill was reached. Then they returned leisurely to their chairs, and waited for the next customer.

If there was but a single carriage at a time, all of them worked it. If there were two carriages, the beggars divided into couples; and if by any chance there were four carriages together, the professionals scattered, and each of them took a vehicle. I drove out on this road several times, and always found it begged by the same persons. I proposed one day to my friends to engage five carriages, and drive them out there together. I thought that we might kill the beggars by caus-

ing them to die of grief and rage at seeing a carriage pass without being able to annoy its occupants.

Another object of interest along the road, and closely associated with the beggars, is the manufacture of macaroni. I did not enter the houses to see how the stuff was made; but I saw great quantities of it drying on frames in front of the places of its manufacture. One of my companions, who had witnessed the process, said they made macaroni by putting some dough around a long hole, and letting it dry.

He said the holes did not cost anything, and the dough was not expensive. "And that is the reason," said he, "why the confounded stuff is so cheap."

I was rather fond of macaroni as an article of diet; and my friend advised me, if I wished to continue so, to remain in blissful ignorance of the manner of its preparation, and not to ask any questions.

I took his advice, and to this day do not know much about the process.

One thing in connection with macaroni, which amused me much, was the dexterity of the chickens in eating it.

A string of macaroni in its soft state, four or five feet long, is hung across a horizontal bar in such a way that the ends are a foot or so from the ground. The frames look like candle-moulds, with freshly moulded candles hanging from them. The macaroni, as it hangs, is pretty thick, there being just space enough between the sticks to allow them to dry. When the stuff is soft, chickens can easily eat it. As it hangs from the frames, these birds would get beneath them, and bite off the ends of the perpendicular sticks.

The young chickens were rather awkward; but the old hens and roosters were very successful. I watched one venerable old cock under a frame, and studied his performance. He elevated his head as if he were peering through a gun barrel up to the sky. He took careful aim, and then jumped upwards, with his mouth open. The soft macaroni went down his throat a couple of inches or so, as a sausage might go down the throat of a terrier; and at the exact

instant when his head was highest, he closed his bill, and nipped off the morsel. I saw him take half a dozen bites in that way, and he did not miss his mark a single time in the whole performance.

We had pleasant glimpses of the Bay of Naples, though not as many as we could have wished on account of the height of the fences. After a drive of something more than an hour, we reached the gate of Pompeii. Dismounting from our carriage, and paying two francs to the custodian, we entered the ancient city.

Pompeii was violently shaken by an earthquake in the year 63. Several temples tumbled down along with the colonnade of the Forum. The theatres and many tombs and houses were also overthrown. Nearly every family went from the place; and it was some time before they returned. The senate hesitated for some time whether to rebuild the city or not, and finally decided to do so. The work of rebuilding was going on quite vigorously, when all at once came the terrible eruption of 79. It buried Pompeii under a deluge of stones and ashes, and buried Herculaneum under lava and liquid mud.

These cities and many villages were wiped out in a single day, and a large region of country was depopulated. After the catastrophe, some of the inhabitants returned, and made excavations for recovering their valuables. Some robbers also crept into the city. The Emperor Titus entertained the idea of cleaning and restoring the city, and sent two senators to examine the ground; but the magnitude of the work frightened the government, and the restoration was never undertaken. In time Pompeii became almost forgotten, and its site was lost. For more than a dozen centuries the locality where Pompeii had stood was unknown.

In 1748, under the reign of Charles III., when the discovery of Herculaneum had attracted the attention of the world to that locality, some vine-dressers struck upon some old walls, and unearthed a few statues. The king ordered some excavations to be made in the vicinity; but it was not until eight

years later that any one supposed that they were exhuming Pompeii. Since that time the work of excavation has gone on with a great many intervals of inactivity. Whenever the government makes an appropriation, or some crowned head or other wealthy personage makes an addition to the Pompeian fund, the work is prosecuted; but as soon as the money is expended the work stops.

It is now more than a hundred years since the excavation began, and the third part of the city is not yet uncovered.

Since 1860, the whole system of work and management has been reformed, and moralized, as it were. All the guides and door-keepers are under the control of the government.

The visitor pays two francs at the gate, and is guided about the city by a man clad in uniform. Notices are posted in all the modern languages, telling visitors not to give money to the guides under any pretence whatever, and forbidding the guides to receive the money. This is all very well as far as it goes; but human ingenuity is able to get around the rule.

We had a guide who spoke French fluently, and was a very polite and agreeable fellow. He took pains to call our attention to one of the signs, and assured us that he could not receive a penny under any circumstances. But at almost every step he had photographs to sell. Whenever we found anything particularly interesting, out from his pocket came a package of photographs, and of course we purchased. By the time we had finished our journey, we had bought photographs enough to stock a small store; and the profit on the transaction was probably six times as much as the guide would have wrung from us had the old system been in vogue. It is very evident that the government winks at this transaction; otherwise the guides would not be allowed to sell photographs or anything else.

We walked through streets silent and deserted, except by groups of visitors like ourselves, and the occasional patrolmen or guides. We walked on the pavement where, two thousand years ago, chariots rolled along, and we saw on those pavements the marks of the chariot wheels as plainly as if they

had been worn during the past month. At the drinking fountains on the street corners, we could see where the Pompeian stopped when he was thirsty. The stone at the orifice, whence the water poured out, was worn away by the many applications of Pompeian lips.

We looked into the ovens as they were on the day of the eruption. The bakers were preparing their store of bread, and we were shown the loaves which had been drawn from those ovens after resting there eighteen hundred years. We saw the shops of the wine merchants, the butchers, the bakers, and the men of other occupations.

We saw the names that had been painted on the door-posts, a little faded and dull, yet still legible. We sat down on benches which were unoccupied for seventeen hundred years; and we entered the dwelling-houses where, two thousand years ago, the members of the family passed their daily life. It was a picture of the past, and not of the present.

Pompeii was preserved, and not destroyed. To its inhabitant, on the day of the eruption it was destroyed; but for us who now look upon it, and study its history, it has been preserved.

The most complete bakery in Pompeii was in Herculaneum Street, and occupied an entire house.

The inner court-yard of the house contains four mills of curious construction. At a little distance they resemble hour-glasses. Imagine two large blocks of stone in the shape of cones, the upper one overset upon the lower, and you have their construction.

The lower one remained motionless, and the other was turned either by a man or a donkey. The grain was crushed between the two stones. Sometimes the servants of the establishment turned the mill. At other times slaves, for some misdemeanor, had their eyes put out, and then they were sent to work at grinding.

The story goes that, sometimes, when the millers were short of hands, they established bathing-houses around their mills, and the passers by who were caught in the trap had to

work the mill. In the establishment now referred to, the machinery was turned, not by men, but by a mule, whose bones were found lying near. In the stable of the mule the racks and troughs were standing. Near the bake-ovens were the troughs where the dough was kneaded.

There was one oven which remained uninjured. It had two openings ; the loaves went into one of these, in the shape of dough, and were taken out at the other opening baked. Everything seemed to be in a fine state of preservation, and the oven could be made use of again for a repetition of its work of eighteen centuries ago.

The oven when found was full of bread. Some of the loaves were stamped to indicate that they were of wheat flour, and others to indicate that they were of bran flour. The oven had been carefully sealed, and there were no ashes in it. Eighty-one loaves were found in it, a little stale, to be sure, and very hard and black, but lying in the same order in which they were placed on the 23d of November in the year 79. The loaves weighed about a pound each. They are round, depressed in the centre, raised on the edges, and divided into eight lobes. Imagine an American pie which has been marked with the knife as if for cutting before it is placed in the oven, and you have an almost exact picture of a Pompeian loaf of bread. I did not try to eat it, partly because I prefer my bread fresh, and partly because the loaves are considered too precious to be given or sold to visitors.

Whoever goes to Pompeii thinking to find a perfect city will be very much disappointed.

The ruins of Pompeii, as the old lady said about the ruins of the Coliseum, are very much out of repair. The walls of the buildings are mostly standing, but the roofs and doors, which were constructed of wood, are gone, having rotted away in their long exposure to the moisture. Everything whatever, of wood, planks, or beams, was turned to ashes : all is uncovered, and there are no roofs to be seen.

Almost everywhere you walk under the open sky ; everything is open, and if a shower were to come on, you would

DISCOVERY OF LOAVES OF BREAD BAKED 1800 YEARS AGO.

hardly find shelter. Imagine yourself in a city in process of building with only the first stories completed, and with no floorings for the second.

Many of the statues and works of art have been carried to the Museum at Naples, so that in the old city itself, there are, comparatively, few curiosities of a portable character. The sky, the landscape, the sea-shore, the walls and the pavements are antique, and it is only the visitors and their guides that are modern. The streets are not repaired, the sidewalks are not changed, and we walk upon the same stones that were formerly trodden by the feet of the Pompeian merchant and his slave.

As we enter these narrow streets we can almost think we are quitting the century we live in, and going back to the century that witnessed the birth of Christ.

When first uncovered, the paintings of the walls were as fresh as though they were made but a week ago, the ashes having preserved them perfectly. In a few weeks or months their coloring fades, and they become dingy and hardly visible.

The Pompeians were great lovers of art; every wall is frescoed, and the mosaics on the floors are an interesting study. Statues adorn the interior of the dwellings, and abound in the public places: even the ordinary utensils of the kitchen were fashioned in a remarkable manner, and far more artistic than those of the present day. The most ordinary utensils of the household are specimens of art that evoke the admiration of every beholder.

As one walks through Pompeii he sees much to tell him that advertising is not altogether an invention of the present age. Placards and posters enlivened the streets; the walls were covered with them; and in many places there were whitewashed patches of wall, serving for the announcements which the writers wished to make public. These panels were dedicated entirely to the public business, and anybody had the right to paint upon them, in delicate and slender letters, the advertisements which we now find in the columns of the newspapers.

Many of these announcements were of a political character, such as proclamations of candidates for public office. Pompeii was evidently swallowed up just before an election. In reading the posters you will find that sometimes it was a noble, sometimes a group of citizens, and sometimes a corporation of tradesmen, who recommended some one to the office of *edile* or *duumvir*. Thus Paratus nominates Pansa; Philippus nominates Caius; Felix, and Valentinus, and his associates prefer Sabinus. Sometimes the elector was in a hurry, and asked to have his candidate chosen quickly. Sometimes a dozen guilds, such as the fruiterers, the porters, the mule drivers, the salt makers, carpenters, and others, united to urge the election of somebody.

Rather curiously, we found on some of these placards that the sleepers declared their preference for somebody, and it puzzled us to know who were these friends of sleep. Perhaps they may have been gentlemen who did not like noise, or perhaps they were an association of tumultuous fellows who thus disguised themselves under an ironical title. They may have been a type of the class who are described in the present slang of New York as *roosters*.

There were advertisements of lost property, hotels announcing rooms to let, stolen horses, performances at the theatres, and various other things, such as we see in the advertising papers, and in posters on the walls at the present day.

There were some of these posters devoted to what we call *personals*. Of course they were obscurely worded, so as to be understood only by those for whom they were intended. One of my companions asserted that one advertisement read, "Julia, same place, six P. M., Tuesday;" and another said, "Scipio, come back; all will be forgiven;" and another was, "Marcus has gone west, will return next week."

I did not see these advertisements, and make the statement only on his authority. I might have been inclined to believe it had he not declared, with the most solemn visage, that he read an advertisement thus: "Secure me a suit of rooms on the Boston steamer tomorrow." This was too much; and I told him that business was played out.

There were inscriptions in reference to the cleanliness of the city ; and some of them recalled, in terms too precise and definite for modern times, the announcement of the present day, " Commit no Nuisance."

Pompeii was not a large city ; it contained only about thirty thousand inhabitants, and was rather a suburb than a great national dwelling-place. The Rome of that day was many times larger ; and when we are considering the buried city, we must remember that we are considering a small hamlet rather than a large capital.

A volume might be filled with descriptions of Pompeii and its contents ; the forum, the theatres, the dwellings, the tombs, the baths, the shops, the stables, the gardens, are all interesting. According to the histories, it was during a festival that the eruption took place. We may imagine the picture, that while the amphitheatre was crowded and gladiatorial combats were in progress, the earth shook, and the sky was dark with the clouds of smoke and ashes rising from the great volcano. The Pompeians rushed from the amphitheatre, and were overtaken by the shower of stones, and the deluge of ashes falling like a burning snow upon the streets ; the dust fills the streets. Heaps of the burning ashes break through the houses, crushing the tiles and burning the rafters ; the fire falls from story to story, and accumulates like earth thrown in to fill a trench. The amphitheatre is speedily ingulfed, and no one remains in it but the dead gladiators, and the prisoners enclosed in their cages, from which there is no escape. Those who have sheltered themselves under the shops, and in the arcade, were buried beneath the ashes and stones.

Skeletons are found everywhere, indicating how people were overtaken in their flight. Here is a fallen woman grasping a bag of jewels ; near by is the skeleton of a man with a bunch of keys in one hand, and the remains of a bag of coins in the other. A woman holding a child in her arms took shelter in an oven, and was enclosed there. A soldier, faithful to his duty, remains at his post before the gate of the city, one hand upon his mouth, and the other on his spear, and in

this brave attitude he died. The family of Diomed assembled in his cellar, where seventeen victims, women and children, were buried alive, clinging closely to each other. The last agony of these poor wretches is terrible to imagine.

A priest of Isis, enveloped in flames, and unable to escape into the street, cut through two walls with an axe, and fell at the foot of the third, still clutching his weapon. A goat was found crouched in an oven with its bell still attached to its neck. Prisoners were found with their ankles riveted to iron bars. Everywhere skeletons have been discovered, and they all picture the anguish and terror the sufferers endured on the day of the eruption.

Many moralists, those who consider that Sodom and Gomorrah were destroyed as a punishment for their crimes, are of opinion that Pompeii was also destroyed because of its wickedness. The discoveries in that city are, many of them, of a character not to be described in public prints, especially by the aid of the engraver's art, at the present day. Some of the ear-drops worn by the women were curious to behold. Lamps were fashioned in forms quite as obscene as they are fantastic; and the same may be said of the chandeliers, and of many of the utensils used in ordinary life. Curiously engraved seals are found that would hardly be suitable to impress to-day on the back of a letter, and there were paintings on many of the walls that should be covered from fastidious eyes.

Certain houses which in American cities are visited by stealth, and whose locality is, to a certain extent, shrouded in obscurity, were boldly designated by various symbols cut upon the stones of the sidewalks and upon the lintels of the doors. Many of these objects have been preserved, and are now in the Museum at Naples; they have been placed in apartments by themselves, where any curious visitor may examine them; and those who are curious in such matters I respectfully refer to the Museum. The impressions on the sidewalks and over the doors remain as they were, and may be examined by any tourist who is interested in their study.

BODIES OF POMPEIANS CAST IN THE ASHES.

## XII.

### VESUVIUS AND ITS ERUPTIONS.

THE GREAT ERUPTION OF VESUVIUS. — WHAT IT DID. — THREE CITIES WIPED OUT. — LAVA AND ITS CHARACTER. — GOING TO THE MOUNTAIN. — SKIRMISHING WITH GUIDES AND BEGGARS. — ARCHITECTURAL STEEDS. — A HORSE WITH A HAND RAIL AROUND HIM. — COAT-HOOKS TO LET. — A MOTLEY CROWD. — HOW AN AMERICAN WAS MOUNTED. — A NEW MODE OF SPURRING. — THE ROAD FROM RESINA. — BURNING LAVA. — CROSSING THE LAVA BEDS. — CLIMBING ON FOOT. — HAPS AND MISHAPS. — AN ENGLISHMAN'S ACCIDENT. — LIGHTING A CIGAR AT THE CRATER. — SUFFOCATED BY SULPHUR FUMES. — DOWN AMONG THE ASHES. — A LONG FALL AND SLIDE. — IN HERCULANEUM. — UNDERGROUND BENEATH THE CITY. — "LOOK HERE." — HOW THE CITY WAS DISCOVERED. — THE ERUPTION OF 1872. — HORRIBLE SCENES. — EXTENT OF THE DESTRUCTION.

THE eruption of Vesuvius that buried Pompeii destroyed Herculaneum at the same time. Some historians contend that the occurrences were not identical in point of time; but, after all, it makes little difference to us whether the two cities were simultaneously destroyed or not. The probability is, and it is pretty well settled, that while the ashes and stones from the crater of Vesuvius were blown upon Pompeii, the lava and mud flowed in the direction of Herculaneum, and covered it. A third city, Stabiae, was destroyed at the same time — a fact which is not generally known. Castellamare, a well-known summer resort near Naples, stands on the site of Stabiae, whose excavations, not having promised very well, were filled up soon after they were begun.

The lava which flows from a volcano during violent eruptions is a composition of melted stone and oxide of iron. The stone is mainly feldspar and hornblende. There is a good deal of sulphur also in the lava when it rises in the volcano, but the most of it is thrown out in the form of sulphurous fumes. The lava very much resembles the slag or scoriæ

(169)

flowing from an iron foundery, and, when suddenly cooled, it assumes a glassy character. When it consolidates or cools, it forms what are known as volcanic rocks. If the streams of lava are cooled under no other pressure than that of the atmosphere, they assume a porous appearance. Lava, cooled under the surface of the water is much more compact, and where it is cooled under heavy masses of earth and rock, it becomes quite solid.

Our party visited Herculaneum after making a journey to Vesuvius. We wished to see the volcano first, and afterwards to explore the city which it had destroyed. We rode out of Naples, after our usual struggle with the hackman, and at Resina left our carriage to proceed on horseback. About half the population gathered to see us off. A staff, or heavy stick, is considered indispensable, and each of us purchased one from the crowd of boys and men, whose wooden material was sufficient for starting a small forest. I think our selection was made from about two hundred and forty-seven sticks, which they simultaneously presented in our faces, and with the demands of the venders and the piteous appeals of forty or fifty beggars, we had, for a few minutes, a concord of sweet Italian sounds.

As soon as we had bought the sticks we used them to clear away the crowd, and as we were all young, reasonably powerful, and as indignant as we were powerful, we made a clear circle around us in a very short time. Then we bargained for animals on which to ride. I obtained a horse, something like those with which the famous Mackerel Brigade was equipped.

My horse had no hand rail along his deck, by which to cling on, though his back-bone had a close resemblance to a rail with a great many knots on it. He had an elegant selection of knobs sticking out all over him, on which to hang superfluous coats and other garments. One of my companions offered to charter two of the knobs as coat-hooks, but immediately withdrew his offer when the horse which he was to ride was brought out. Mine looked like a frame with a skin drawn

### REMARKABLE STEEDS.

over it, but his resembled a frame without any skin. I suggested that, when he got through the journey, he might sell out his horse to be used as a lantern for a light-house, and that the ribs would give a peculiar effect to the rays of light.

The third man of the party obtained a mule that had lost one ear, and had his tail eaten off by the rats. The beast had a habit of going backward faster than forward, and before we had gone a mile we asked the guide to shift the saddle so that our friend's face could be turned towards the stern of his craft; but the guide insisted that such a thing had never been done, and that the mule would be all right if the man behind him would give an occasional prod with his stick. The fourth man was mounted on a donkey, or mule, or horse; I cannot say exactly what the animal was, but he seemed to be a mixture of the three, with a small infusion of bull-dog and rhinoceros.

He had a hide that would turn a six-pound shot, and as for cudgelling, he rather enjoyed it than otherwise. His rider had brought along a pair of spurs, which he picked up a day or so before in Naples. He proposed to show us his skill in mulemanship, but the mule was so small, and his rider's legs were so long, that the latter could not reach the beast with his heels. I suggested a dodge which I had seen in practice before. With the spurs on his heels my friend found his feet too far aft, when he raised them, to do any good; I accordingly suggested that, if he buckled the spurs on just below the knees, he would find them to be of more advantage. He tried it with one spur, which had a perceptible effect on the activity of the animal; but, unfortunately, the activity was sidewise, or backwards, or in circles, and not straight ahead. The beast either sidled along the track, or else went in quick plunges, in a way that was very uncomfortable. Our whole cavalcade, considered as an average, did not get along very fast, and every fifteen minutes we had a grand kicking plunge all round; but we were all sufficiently accustomed to the saddle to save ourselves from being thrown. We made about three miles an hour each along the route, or fifteen miles an

hour for the five of us, which, on the whole, was not to be considered bad.

The road from Resina winds along sometimes over the lava beds, and sometimes on a carriage-way, constructed at great expense, but now almost entirely useless. In some places the lava, though it had been lying there several years, was quite warm, and there were cracks, from which the heat steadily issued. Lava requires a long time for cooling, and sometimes, where it is of great depth, it will not cool enough for one to walk upon it within two years after it has flowed from the mountain. We got along very well, assisted as we were by the native loafers, who followed us, and occasionally took a turn at, or, rather, with, our animals' tails. With the mild beasts they got along very well, and I think the animals would have had their tails twisted off before breaking into a run; but the vicious beasts did not like the arrangement, and they either quickened their pace, or let fly their heels at the twisters.

My horse had been warranted to me as a safe beast, and after we had fairly started, I found that he was pretty nearly as safe as a dead horse. When he began to climb the mountain, he really seemed to be more dead than alive, and no persuasion, whether with my stick or heels, could induce him to break into a run. When we reached the foot of the cone, half a dozen boys offered to hold him; but I concluded he had better hold the boys—one was quite sufficient to keep him quiet while we made the upward journey.

The real work of climbing Vesuvius began at the foot of the cone. The beasts that had brought us would not go beyond this point, and so we dismounted. After refreshing ourselves with a bottle of villanous wine, that tasted of sulphur, sewer-water, and other delightful things, we removed our coats and started upward. There was a fresh lot of loafers, who wanted to assist us. They had chairs strung upon two poles, by which four men could carry a person to the summit. The chairs were very good things in their way, but I preferred to walk, and so did my companions. The path sloped at an

angle of forty-five degrees, and was made up of ashes and stones. The natives had arranged the stones in such a way, that a person could step from one to another without great difficulty, only that it happened that the stones were so far apart that they occasionally needed a pretty wide step.

Finding I would not be carried in a chair, the loafers importuned me to be dragged up with a strap or rope. A stout fellow went in front of me, and continually pressed me to seize a strap which he invitingly pushed before my nose. I repeatedly told him that I did not want it; but he stuck to me half way up, and then concluded I was a bad bargain. As I would not accept his offer of assistance, he proposed that I should give him half a franc to leave me. This I refused to do, and told him he might go to the summit if he liked, and enjoy the scenery; but he wanted no summit, unless he could earn something. He started back down the mountain, and I had the pleasure of seeing him miss his footing, and roll to the bottom. I learned afterwards that, most unfortunately, he did not break his neck, and was not seriously injured.

I have had a good deal of climbing in my life, but that was the worst thirteen hundred feet I ever made at one time and in one piece. I had to stop several times on the way up, in order to take breath, and something with it to make the breath go down. One of my friends suggested giving it up when near the summit; he said there had been a great mistake in the statements of the guides and guide-books. I asked him how it was, and he said, "We were informed that donkeys go only to the foot of the cone, and not to the top; but it is my impression that there are now four of the greatest donkeys in the known world trying to reach the summit." We forgave him for his joke, and, after a mouthful of bad wine, he felt better, and proceeded.

For a good deal of the distance where we climbed it seemed as if we slipped back one step for every two or three that we took forward, and in some places we slipped back two steps where we went forward one. An exhausted Englishman was just ahead of us, and his misery gave us great comfort.

One of the Italians had a leather strap fastened about his own neck, and persuaded the Englishman to take hold of it. Another Italian went before the first, and held on to a strap around the first man's waist. Another Italian went behind the Englishman, and pushed him ahead, so that he managed to get along very fairly.

At a critical moment the rear Italian slipped; the Englishman slipped next, and pulled down the two fellows in front. The result was, that the whole four were doubled up in a heap, rolled over in the ashes, and lost about fifty feet of distance before they could recover themselves. For about a minute there was a confused mass of legs, arms, and curses, some Italian and some English, which drew forth shouts of laughter from the spectators. The enraged Britisher did not like the journey, and gave up the attempt as a bad job. We were sorry for this, as we expected him to be suffocated in the sulphur fumes at the top, and afford us an opportunity to observe his agony.

When we reached the summit we sat down to rest, and take a little wine. Then the guide led us around to the crater, where the fumes of sulphur and clouds of steam were rising out of the volcano, and around a great, yawning gulf, that was a complete mass of fire. We had to hold our kerchiefs over our noses to save us from suffocation, and even with this it was almost impossible to breathe. The crater, at that time, was comparatively small, — at least, so they told me, — but it seemed to me a very fair crater for all practical purposes. The flames filled it from side to side. Their colors were white, purple, yellow, and crimson, and they threw up clouds of smoke and steam. It seemed as if the summit of the mountain was hollow, and might easily be broken in. If a man should fall into the crater, his chance of escape would be as good as if he was dropped into the middle of the Atlantic Ocean, with a twenty ton anchor fastened to his neck.

It seemed to me as if there might be an eruption at any moment, and I wanted to get away from the place; but the guide said there was no danger, that the crater always filled

up before an explosion, and that they knew days and weeks beforehand when it would occur. To convince me that there was no danger, he said that he had a family to support, and wanted to live, though I could see no reason why, and he had no hesitation in going close up to the edge. Although I had no family to support, I knew a man who had one. I therefore concluded to do as he did, and so crept up and looked over, holding the kerchief all the while to my face.

A very brief gaze was sufficient for me, not because the sight was less grand than I had expected, but because the fumes of sulphur were so strong that I feared I might faint, and in falling, drop into that confounded hole. There are various modes of death which I should consider disreputable, and dropping into a volcano is one of them.

We went so near to the fire that I lighted my cigar at the flames of Vesuvius, and as I was quite weary I enjoyed the cigar with a great deal of relish. We cooked some eggs which we purchased of an Italian speculator. He had brought them up at a venture, and provided himself with salt and bread, and a few bottles of wine, so that we were able to make a comfortable meal. Our appetites had been sharpened by the labor of climbing, and we made a hearty repast.

Going down the mountain was much easier than going up. We did not go down at the same place where we made the ascent, but went a little to one side, where we could walk down through the ashes. The first step or so is a little trying to the nerves, but after two or three steps you acquire confidence and then let yourself out. All you need to do is to stand erect, throw your head back, and start off, putting one foot before the other in a dignified sort of way. The ashes are generally dry and dusty, but at the time of my descent they had just been moistened by a slight fall of rain, so that no dust arose from them. Our feet settled in the ashes up to the ankles, and at every step we went forward six or eight yards. It took us an hour and a quarter to climb the mountain, and we came down in seven minutes, including a halt on

the way to make love to an English girl, who had slipped, and was unable to pick herself up. We assisted her to her feet, and lost a minute or two in our work of gallantry.

A countryman of ours who attempted to come down just behind us was not quite as successful as ourselves. He managed to pitch forward and turn a very pretty somersault; but the exercise did not improve his personal appearance or his temper. When he brought himself to rights, and reached the place where the horses were standing, he was very much dilapidated, and as cross as a bear with a chewed ear.

It is hard work to ascend Vesuvius, but it is jolly fun to come down.

We mounted our animals and came away. On the steepest part of the descending road, we tried to get up a race, thinking that the laws of gravitation would help us. Part of the beasts were induced to run, but there were two or three out of which no speed could be made faster than a walk. Even a descent as steep as the roof of an ordinary house had no temptations for them, and I wanted to try the experiment of flinging them over a precipice, to see whether they could be started into anything like a respectable pace. I have my doubts about it; and had they been flung from a perpendicular cliff, I think they would have come down through the air as majestically and as calmly as a parachute descends from a balloon.

When we reached Resina, we rode to Herculaneum. The modern discovery of this city resulted from digging a well in the year 1709. The site of the city had been lost, owing to the great depth — nearly one hundred feet — of the solid material which covered it. Properly speaking, Herculaneum was destroyed by liquid mud, rather than by burning lava. Since the destruction of the city, there have been six different overflows of lava, so that for all practical purposes the site is covered with this solid material.

When the well referred to was being made, the workmen came upon another well; an ancient affair, nearly eighty feet from the surface. Several works of art were brought to light,

DESCENT OF VESUVIUS.

but for some reason the government of Naples prohibited the explorations. Thirty years later they were renewed, and have since been prosecuted at different intervals. The area thus far opened does not exceed six hundred yards in length by three hundred in breadth, and some of the portions excavated have been filled with rubbish, to avoid the expense of raising it to the surface.

A village or city stands directly above Herculaneum. Underground passages, like those of a mine, have been explored without uncovering them to the light of day. A large theatre, capable of seating eight thousand persons, is the most important building discovered. Its walls were highly decorated, and its floors and pillars were constructed of differently colored marble.

The streets of Herculaneum were found to be paved with lava, just as the streets of Naples are paved to-day. One street was more than thirty feet wide, and furnished with raised sidewalks. The houses were of brick, not very large, and only one story high. Among the works of art taken from the ruins there were many statues, and busts, and articles of furniture, some of them admirably executed, and evincing a highly cultivated taste. There were various musical and surgical boxes and instruments, and many utensils belonging to the kitchen and toilet. There were specimens of colored glass imitating precious stones, and a great variety of cooking utensils, among them pans of copper lined with silver. Many fine paintings were discovered on the walls; some of these have been removed, and are now preserved under glass. Like those of Pompeii, when first discovered they were brilliant, but latterly have lost their color, and are greatly faded.

Our descent into Herculaneum was by a staircase opening from a small house, where we found a number of guides in uniform. We paid our two francs each, and were remitted to the care of a guide who spoke English. He preceded us down the stairs, describing objects as he went. His best English words were "Look here," and he injected them into every sentence. His description was something like this:—

"Look here: Herculaneum was destroyed the same time as Pompeii. Look here: these are the steps which led down in Herculaneum. Look here: the street—look here—runs right by us. Look here: eighty-five feet high. Look here: you can hear the carriages rattling in the street. Look here: here is the theatre where they used to have the great shows. Look here: here you have the stage. Look here: eight thousand people might be seated in this theatre. Look here: they dug out the rock, but they have quit digging now. Look here: it does not pay the government to dig out this rock any more. Look here: the guides take no money from visitors. Look here: some fine specimens of stone; you will buy. Look here: only two francs a box. Look here: here is where they found a fine painting. Look here: you will see them at Naples. Look here: in the Museum. Look here: this is the mask which was worn by the actor, which was Poesy. Look here: this is a mask which was used for Comedy. Look here."

And so he went on describing the place, and telling us its history, offering specimens for sale, giving us the number, names, and sex of his family, and letting us into all the details of his private life, and at every sentence throwing in "look here." It was his trump card, and he made the most of it. It was probably the first sentence of English which he ever learned, and he was bound to make it as useful as possible.

By the light of the candles we examined Herculaneum, but it was far less interesting than Pompeii, and we remained only a short time below the earth. Bidding our "look here" guide good by, we mounted the steps into the open air, and returned to Naples.

The natives and guides around Vesuvius claim to know when there will be an eruption, as there are certain signs which never fail. The crater fills up, the wells in the neighborhood become dry, and there is a series of rumblings and shakings for a few days before the outbreak. There were indications of an eruption at the time of my visit, and in the following year the eruption came. It did much damage, and

attracted many visitors to Naples, but it did not equal in extent or magnificence the great eruption of 1872. This outbreak began on the 23d of April, and was at once the grandest and most terrible of all the eruptions that have occurred during this generation.

For some days previous to the outbreak the mountain gave indications of approaching activity, and when the eruption began, hundreds of people observed it from the old lava beds between the observatory and the town of Resina, and some of them remained there during the whole of the night of April 25. Early the next morning two great seams opened under these spectators' feet; hot sulphurous vapors enveloped them, and as they sought safety in flight, great rivers of lava rushed out of the newly-opened craters, and threatened the frightened sight-seers with speedy destruction. Some found the earth under them too hot to be walked upon, and, falling down, perished where they were. Others were suffocated by the gaseous emanations from the earth, and still others were so injured that they died after reaching a place of safety.

In the towns and villages around the volcano the destruction of property was very great, but the people generally escaped by timely flight.

In all the towns the terror was wide-spread. Nine distinct craters were opened, and lava streams, some of them sixteen feet deep, ran down the sides of the mountains, destroying everything in their paths. Several of the villages were almost entirely buried in ashes, as ancient Pompeii was in the eruption previously described. Even in Naples, people were almost smothered with the shower of dust, cinders, and sand that poured down for days. Every window was kept closed, and every traveller through the streets was compelled to protect himself by carrying an umbrella; and there were serious fears, on the part of the timid, that the beautiful Italian city of to-day was to play the tragic part of Pompeii in a repetition of the terrible scenes of eighteen hundred years ago.

Many people lost their lives, some in consequence of remaining to protect their property, and others from venturing too near out of motives of curiosity. At one time a group of fifty or more people were surrounded by the lava, and burned to death in sight of those who were powerless to aid them. They were standing on a little hill, and did not see, until too late, that the lava had flowed around it, and placed them on an island, as it were, with a red-hot river all around them. Many others were burned by the lava and the hot blasts which came from it in various parts of its course. A gentleman who witnessed the eruption thus describes the scene in a letter written from Naples on the 27th of April, 1872:—

“Yesterday morning I went out to get a carriage to go up Mount Vesuvius, and on my way I was asked by a respectable looking man in the street if I had heard the news of the night. He then told me that hundreds of people, who had gone up the night before to see the burning lava in the Atrio di Cavallo, were dead. I had seen the mountain at eleven o'clock the night before, when there was a stream of lava running from the top of the cone into the Atrio—that is, the valley between Vesuvius and the adjoining hill, the Somma, where there seemed to be a lake of fire. Later in the night there was a tremendous eruption, a large crater opening suddenly between the Observatory and the Atrio di Cavallo, across the path of the visitors, it is said, of a mile in diameter. We started from Naples at eight o'clock. The view of the mountain was magnificent. An enormous cloud of dense white smoke was ascending to an immense height above the mountain, like great fleeces of cotton wool, quite unlike any cloud I ever saw. I could see the lava rushing from several openings to the right of and above the Observatory, but below the cone. The lava was still flowing from the cone into the Atrio, but no ash or dust was thrown up. We drove on to Resina, where the population were in fearful excitement, not knowing what to do, and apparently apprehensive of instant death—everybody making signs to us, and telling us to go back. We went on to the Piazza di Pugliano, where we

THE CRATER OF VESUVIUS.

were stopped and told that no one was allowed to go up the mountain, by order of the police. However, after some expostulation, I took a guide on the box and started again.

"A few minutes afterwards we met a cart bringing down a dead body, and as we went on we saw other bodies—at least twelve—of which one only appeared to be living. They were frightfully burned on the face and hands, and some, which were carried on chairs, in a sitting position, were very ghastly objects. Further on we met people—officials, apparently—coming down, all warning us to go back. At last, when we had arrived at an elbow of the road not far below the Observatory, we met the officer who has charge of the Observatory, who said we could not go on; that the danger was imminent; that the lava was running across and down the road before us; that he had orders from the prefect of Naples to prevent any one ascending, and that we could not pass. My coachman was getting a little anxious, though I will do him the justice to say he was not afraid; so I consented not to take the carriage beyond a turn in the road above us to the right, especially as I did not wish to meet the lava in a narrow road where we could not turn the carriage. We left the carriage there, and ascended on foot with the guide by a path straight up the mountain-side.

"At length we stood on the edge of the flat ground reaching to the foot of the cone. Currents of lava were running down on both sides of us far below; the craters from which they flowed were hidden by the smoke; clouds of smoke were ascending from the top of the cone, and the lava still pouring down the Atrio. The roar of the mountain, which we had first heard at Portici was now tremendous, continuous, and unlike anything else I ever heard,—millions of peals of thunder rolling at the same time,—when suddenly, about noon, there was a cessation, with a low, rolling sound; and one heard the ticking and rippling of the lava currents pouring down the hill-sides below. Then, in about a minute, came a deafening roar, shaking the ground under our feet; and a new crater burst forth just on the other side of the Observatory, as it seemed

to us, and dense clouds of ashes and stones were thrown up into the air on the left hand of, and mingling with, the great white cloud, making a great contrast with the dark-brown dust and ashes, which rose perpendicularly to an immense height. The roaring continued and kept on increasing till it became deafening, and I began to think it might injure our ears. We staid there about an hour and a half.

"The scene was magnificent, the smoke occasionally clearing away and giving us the view towards the Atrio, that towards the cone being always clear; but as some of our party fancied that the ground might open under our feet, and that we might find ourselves in the midst of a new crater, I at length reluctantly sent the guide to bring up the carriage. Had I been alone I should have staid there till the evening. When we had gone down a short distance the same phenomena again appeared. The sudden cessation of the tremendous roaring, the clicking and rippling of the falling lava, and the low muttering became then again audible; then the fearful roar, and the shaking of the ground, and another crater burst forth on the flank of the mountain, below the Observatory, sending up clouds of dust and ashes, which rolled over and over till they reached an enormous height, but quite separate from the other clouds. All this time the sun was shining in an Italian sky without a cloud.

"After stopping some time to admire the scene, we continued our descent; but before we reached the bottom of the hill we saw the lava from the last crater tearing its way down through the vineyards to our right with wonderful rapidity. Just an hour after we left the top of the hill the cone commenced sending up torrents of stones, which fell in all directions; but whether the red-hot hail reached our position on the height I know not. When we reached Resina it was curious to see the congratulations for what they thought our escape on the faces of the people. The uncertainty and the panic were gone, and they were steadily packing up their beds and the few things they could carry, and starting with every sort of conveyance to put their guardian saint, St.

Gennaro, between them and the danger. When I started from Naples I expected to find all the world at the top of the mountain; but, to my great surprise, there was not a single stranger there — only the few persons employed in bringing down the dead. I believe the police prevented any carriage passing after ours. The awful roaring of the mountain continued and increased till midnight, when it ceased, and only roared again for a short time about four o'clock. To-day the mountain is quieter, and the Neapolitans are a trifle less pale. The view of the mountain at midnight was grand in the extreme."

Several villages were destroyed in this eruption, and many acres of vines were covered with lava and ashes. But as soon as the eruption was over, many of those who had fled returned to whatever of their old homes they could find. There is something strange in the fascination of the people for the places which they are well aware are liable at any time to the lava torrent or the storm of ashes. Eruptions have occurred, and will occur again; but all the reasoning you can offer would not induce these Italian peasants to go and live elsewhere.

I WAS once in a mine in Colorado, when I fervently wished myself out of it. I had been there a day or two before, and found that in one of the levels I was just able to stand erect. At the visit in question I found I could not stand erect without hitting my head. I was certain that I had not grown six inches taller in the mean time, and I accordingly concluded that the roof had settled. All at once, while proceeding on my walk, I was astonished at hearing a crackling sound behind me; and on looking around, I discovered that some of the timbers were giving way.

Here was a predicament. The breaking timbers were between me and the entrance to the mine, and I knew that if they should fall, so as to close up the passage, I should be cut off from escape.

It did not take a long time for me to determine what to do. At the risk of being crushed by the falling timbers and rock, I darted backward, extinguishing my light in the rapidity of my movements, and becoming wrapped in almost complete

FALLING IN OF A MINE.

FALLING IN OF A MINE.

darkness. Luckily, however, there was a light burning in the level; and as I crept among the breaking timbers, it was as welcome to me as the polar star to a man at sea, when his compass has become unreliable.

Another and another of the timbers gave way as I walked, or rather crept, beneath them. When they were broken in the centre, they had partly, but not completely, closed the passage, their ends being held firmly in the rock. I managed to reach the other side, and as soon as I considered myself safe, I turned round to see what was going on. The timbers settled very slowly; there was no one on the level beyond them; and had any persons been there, the settling of the roof was so slow, that they would have had plenty of time for escaping.

When I reached the outside, I made a vow to avoid similar dangers in future, and it was some time before I again ventured where I should be liable to a similar accident.

Falls of the roof are a kind of danger which is always thought of when underground works are considered. In certain kinds of rock there is no liability to occurrences of this sort. The roof is as solid, and as well supported, as that of any house, and there is no danger of its yielding; but where the rock is slippery and loose, or where the ground is soft, the peril that threatens is constant.

Falls of earth are not unfrequent in digging wells. Many a man has lost his life in consequence.

An exciting story is told of a well-digger, named Giraud, who was excavating a well near Lyons, about twenty years ago.

The earth caved in, and Giraud found himself dashed to the bottom of the hole by the side of a fellow-workman. Luckily, the timbers fell in such a way as to form a sort of arch above their heads, and thus saved them from being crushed at once. Some men, who were above at the time of the accident, immediately set to work to save the sufferers. It was necessary to dig a new shaft near the first, and then connect the two by a drift-way, which would reach the men at the point

where they were enclosed. Their efforts were constant, but in spite of them, a whole month was spent in reaching the spot, as fresh falls of earth were constantly occurring in the new workings. Giraud and his comrade could hear the noise of the pick, and could converse with the workmen, and assure them that they were alive.

At the end of a week, Giraud's companion died of exhaustion and starvation. Giraud was a man of great strength, both of mind and body, and bore up as well as he could under his suffering. The dead body of his companion, which lay near him, poisoned the little air he had to breathe; but somehow he lived day after day for a whole month. Every moment his rescuers expected to reach him, when some fresh accident occurred, and much of the work had to be done over again. On the thirtieth day they reached the prison, and Giraud was saved.

He was wasted to a skeleton, and unable to stand. His body was a mass of sores; gangrene had attacked all his limbs, caused by the corpse which had been rotting at his side for three weeks. He was carried to the hospital, and every attention was given him; but he had suffered too much, and died within a month of the day of his rescue.

Occasionally masses of rock drop from the roof without the least warning, and fall upon the heads of the miners. Sometimes a man may escape with the loss of a limb, or he may be killed outright. In other cases, the walls and timbers give way, and men are crushed beneath their weight.

A story is told of a miner who was caught by the fall of some coal which nearly crushed him, but he had sufficient strength remaining to call for help. A comrade heard him, and gave the alarm. All the men who could work in the small space were immediately gathered; and a part of the coal having been removed from around the sufferer, his head and one of his hands became visible. He was lying on his right side upon the floor of the gallery, with his legs doubled beneath him. There was a mass of broken timber above him, so that he could not move, but fortunately his chest was not

compressed. Air was supplied him by means of a ventilator and a tube. The rails and some of the other timbers by which he was enclosed were cut through, and a space was opened in such a way as to reach him from below. He did not lose courage a moment; he remained perfectly cool, and gave his preservers several useful suggestions. Finally, after six hours of suffering, he was removed.

In several instances miners have been enclosed in such a way that escape was impossible. All efforts to relieve them were unavailing, and those who remained uninjured from the fall of the rock died of suffocation or starvation.

Let us change a moment from the horrible to the ludicrous. A few months ago, an Irishman, who was digging a well in Illinois, left his work, and went to breakfast. When he returned, he found that the earth had caved in. There was a clump of trees a few yards away, and after looking around to ascertain if any one was in sight, and knowing that some friend would be there shortly, he took off his coat, hung it upon a post, and then, taking his shovel and pick, retired to the shelter of the trees. He had just concealed himself, when his friends made their appearance. They saw the coat hanging upon the post, and they saw that the earth had caved in. Immediately concluding that their friend was buried below, they set at work to rescue him.

They worked with the greatest energy for two or three hours, and at the end of that time had removed all the fallen earth. But no Pat was there. Just as they were wondering what had become of him, he walked leisurely from his place of concealment, and thanked them for what they had done. At first they were inclined to be indignant, but finally concluded that it was a good joke, and a few drams of bad whiskey removed all differences.

The danger of underground inundations is as great as that of falls of earth. Water is constantly accumulating in a mine, and sometimes in such quantities as to defy all attempts to keep it under control.

Miners have curious theories about streams of water which

enter the mines. Some of the English miners believe the earth is alive, and they compare the veins of water in the earth to the veins and arteries of the human body. Sometimes they say, "When the water breaks into our working-places, it is the Earth which revenges itself upon us for having cut one of his veins." The Belgian miners have the same belief, and they call the water which flows out of the coals, '*le sang de la veine*,' that is, 'the blood of the vein.'"

Inundations of mines are frequently fatal. Sometimes the water enters with great force. One day, in an English coal mine, the water fairly drove out the auger with which the workmen were boring a hole. It came as if from the nozzle of a fire engine. The workmen made several attempts to plug the hole, but could not, and were driven out. A few hours later the mine was flooded. Pumping machinery was set up, but it was not until the end of seven years that the water could be removed. It was only then stopped by means of banking, that prevented its further entrance.

In a mine near Newcastle, many years ago, there was an inundation which enclosed ninety men in a place where it was impossible to relieve them. Several persons, who were working close to the shaft when the water entered, managed to escape, but they were very few in number. The accident occurred in May, and it was not until the following February that the bodies of the drowned men were recovered. With one exception all were recognized.

At another coal mine, which was worked on the sea-shore, and extended a distance of fifteen hundred yards under the Irish Sea, the manager, in his anxiety to produce a large quantity of coal, recklessly cut away some of the pillars which supported the roof. One day the whole neighborhood was alarmed with the report that the mine had fallen in. The commotion was so great that many persons on the shore observed the whirl of the sea directly over the spot where the water entered. A few of the laborers escaped, but thirty-six men and boys were drowned. The accident happened more than thirty years ago. The coal mine is now, and always

must remain, under water, and the bodies have never been recovered.

Some of the most terrible mining accidents are those which occur in consequence of the closing of the shafts. Where a mine has two shafts there is little liability of such accidents; but where there is only a single shaft the danger is constantly threatening. The terrible calamity at Avondale, which is fresh in the minds of many readers, will be described elsewhere.

A similar accident at an English coal mine, a few years ago, was even more terrible in its results than the calamity at Avondale.

The beam of the pumping engine gave way, and killed five men who were at that moment coming up in the cage. One hundred and ninety-nine men and boys were then working under ground. The enormous beam of the engine weighed more than forty tons. In its fall it carried down all the timbers of the shaft, damaging the walls in several places. The rubbish and broken timbers accumulated in the shaft, and closed the only mode of egress for the miners. The beam and timberings cut off all connection between the interior of the mine and the outside world. The mine was furnished with ventilating furnaces, in which a large quantity of fuel was burning, and it was supposed that the imprisoned miners died of suffocation within twenty-four hours. Some of the men who were imprisoned tried to force an outlet, but they were unable to do so, and died in the effort.

Many accidents of this kind might be described. In the various coal-mining countries of the globe, they may be said, in the aggregate, to be of almost weekly occurrence. Where the owners of mines neglect or decline to provide their works with two entrances, it is imperatively necessary, for the protection of life, that the law should interfere, and compel them to do so.

A few years ago, at a mine in France, the engineer one day observed that the cages did not work properly in the guides. Fifty-six yards below the surface he discovered that the lin-

ing of the shaft deviated from the perpendicular. The joints and displacements were visible at several points. All the men, three hundred in number, were ordered to leave the mine.

Men went down the shaft to cover the openings, but the result was only to create fresh ones. For the next two days the lining of the shaft repeatedly cracked.

The planks broke one by one, and the water rushed into the works. The consulting engineer of the mine was called in, and when he arrived he descended with the superintendent, both of them in fear that they were going to certain death. Their lamps went out while they were descending, but they carried a lantern, which was hanging to the bottom of the tub in which they descended. By the light of this lantern they discovered an enormous opening in the middle of the lining. Stone, and earth, and rubbish were continually falling, and a torrent of water ran through.

"Let us go up again," said the engineer. "The water is master of the situation, and all hope of saving this working is gone."

In relating this incident afterwards, the engineer said, "I lived ten years in half an hour. My hair turned white in that perilous descent, which I shall never forget as long as I live."

A few hours afterwards, holes which began at the middle of the shaft extended from top to bottom. At the pit's-mouth, an immense opening had formed nearly forty yards in diameter, and ten yards deep. Engine, boilers, buildings, machinery, and scaffolding gradually fell into the opening. At each movement of the ground a fresh ingulfment took place. The sky was dark and covered with clouds. The timbering of the shaft gave out sparks under the enormous friction which was caused by the sudden fracture of the wood. A peacock, shut up in the neighboring court-yard, gave signs of alarm, and uttered loud cries at every movement of the ground, and at every fresh fall. "No poet could describe, nor painter represent, the desolating spectacle which we witnessed," said the engineer, in concluding the account of the occurrence.

In this country it is next to impossible to give correct statistics of the number of lives lost by these accidents. In Great Britain and France statistics are obtainable.

In those countries, according to the report of the inspectors of mines, about one half the mining accidents are occasioned by falls of the roof and coal. A third of the accidents are in the shaft in various ways. The remainder, or one sixth of the casualties, occur from blasting, explosion of fire-damp, suffocation, and, finally, inundation.

According to an English report, there was one death for every two hundred and sixteen persons employed in the mines. It was estimated that one life was lost for every sixty-eight thousand tons of coal obtained. In some districts of England the proportion was one life lost for every twenty-two thousand tons. In the year 1866, six hundred and fifty-one lives were lost from explosions of fire-damp. In the previous year there were only one hundred and sixty-eight deaths from the same cause. Altogether, in the year 1866, there were fourteen hundred and eighty-four deaths from mining accidents in Great Britain alone. The total number of deaths from all violent causes in the mines of Great Britain, in ten years, was nine thousand nine hundred and sixteen. Twenty per cent. of these were caused by fire-damp explosions.

The greatest number of lives lost at any one time through mining accidents was at the Oaks Colliery, in 1866, when three hundred and sixty-one miners lost their lives.

At the Hartley, Wigan, and Bury Collieries, many fearful accidents have taken place within the past few years, whereby many lives were lost. These accidents, in justice to the owners, or superintendents, let it be said, are not always due to the want of precaution on the part of the managers, but from gross neglect, or through non-observance of the rules under which the mine is worked. For example, the men were very careless in the use of the safety-lamps. Every lamp is locked before it is given out, and every care is taken to prevent its being opened. The men will occasionally amuse themselves by trying to pick the locks, and that, too, in places where the

air is full of explosive gas. So accustomed are they to danger, that they hold it in great contempt; and the result is, that fatal accidents were much more common than if men were cautious and obedient.

At the time of the Oaks Colliery explosion, great sympathy was manifested throughout England, just as was subsequently seen in the Avondale disaster in America. For days after the occurrence, the daily papers were filled with long details of the horror, the recovery of the bodies of the victims, the distressing scenes at the mouth of the mine, and at the graveyard, and the brave deeds of the men who were fortunately absent from the mine at the time of the explosion.

Subscriptions were opened in nearly every church for the benefit of the survivors, and at the suggestion of Queen Victoria, the then Lord Mayor of London and Common Council held a public meeting to raise money for the families of the victims. The appeals were liberally responded to through the whole country. Many of the wives of the dead miners received life pensions, and all the bereaved families were placed above immediate want.

## XIV.

### THE INUNDATION AT LALLE.

INUNDATION OF A MINE ON THE LOIRE. — HOW THE MEN WERE SAVED. — SONG OF THE PUPILS OF THE MINING SCHOOL AT ST. ETIENNE. — TERRIBLE FLOOD OF A MINE AT LALLE. — BREAKING IN OF A RIVER. — COURAGE OF AUBERTO, A WORKMAN. — SAVING SIX LIVES. — PLAN FOR RESCUE. — DISCOVERING THE WHEREABOUTS OF THE PRISONERS. — ONE MONTH'S WORK IN THREE DAYS. — OPENING THE DRIFT-WAYS. — SIXTY FEET OF TUNNELLING. — IN THE DARKNESS WITH A CORPSE. — STORY OF THE RESCUED. — THIRTEEN DAYS OF PERIL. — FINDING THE BODIES OF THE DEAD. — ONE HUNDRED AND FIVE MEN DROWNED. — SAVING A CHILD. — EATING WOOD AND LEATHER TO SAVE LIFE. — A HORRIBLE SIGHT.

IN one of the mines on the River Loire, about thirty years ago, there was a terrible accident, caused by the sudden eruption of the water. The water came in like a torrent, and drove the miners up an inclined gallery, where there was no outlet. The people above ground rushed to their assistance; the engineers brought their plans of the mine, and determined where the enclosed men were to be found, if still alive. Workmen volunteered to go to the assistance of their comrades, and a new gallery was begun in the direction of the supposed place of refuge. The blows of the pick upon the wall were at first unanswered; but after a while, faint sounds were heard in response. The rock was hard, and progress was slow; but every man did his best, working night and day. Sound is transmitted through rock with great facility, and in a little while the workmen could hear the voices, as well as the knocking of their imprisoned friends. Six days passed in this way, and at length a hole was bored through the rock, and the colliers were found to be all living.

Though they were near starvation, and had eaten their candles, and even their leather straps, their first appeal was

for light, not for food. Prolonged darkness is distressing in the extreme, and these men had suffered the total absence of light nearly the whole of their time of imprisonment. Candles were passed through the bore-hole, and then a tin tube, through which broth was poured. The work of relief was pressed forward, and at the end of the sixth day the sufferers were released and brought to daylight, amid the cheers of the men assembled around the mouth of the mine.

The story of the release of these miners is familiar to all the inhabitants of that region. The pupils of the Mining School of St. Etienne composed a ballad, of which the following is the opening stanza:—

“ Mineurs, écoutez l'histoire  
De trois malheureux ouvriers,  
Restés sans manger ni boire  
Pendant six grand jours entiers.  
Au fond d'une galerie  
Serrés comme en un local,  
Ils auraient perdu la vie  
Sans la coupe verticale.”

This ballad was sung two or three times daily, at the beginning and end of lessons when the master was not present. One of the teachers of the school assisted at the rescue of the miners, and used to tell the story to his pupils. He added a moral to it, after the manner of Æsop with his fables, and endeavored to impress upon the school the importance of vertical shafts from all the principal galleries to the surface. Many lives have been lost in mines in consequence of the absence of these shafts, and in every locality where mining is conducted on an extensive scale, the law should compel the owners to make at least two openings to the outer world.

In 1862 an inundation occurred at the mine of Lalle, in France, by which one hundred and five persons lost their lives. The story is thus related by M. Simonin:—

On the 11th of October, between three and four o'clock in the afternoon, a violent storm visited the country, and it is asserted by some of the inhabitants, that a waterspout had

INUNDATION OF A MINE.

burst there. The waters of the River Cèze, as well as those of a stream and of a ravine, which is dry at ordinary times, both of them being tributary to the Cèze, rose higher than they had ever been seen before. It was a vast inundation, or, as the people of that region describe it, a deluge. The mine extended under the river, and its mouth was not far from the bank. The water made a whirl at one point, and then rushed into the mine through a large opening over the outcrop of one of the coal seams. There was a rumbling noise all through the mine; all hands were at work under ground, and there was danger of a terrible calamity. Some of the men managed to escape by the ladders, while others hastily ascended a shaft, and floated upwards on the surface of the water.

A noble act of courage and devotion was performed by a Piedmontese workman by the name of Auberto.

He escaped up a shaft, and as he did so, he gave the alarm to a comrade who was at work in a lower level. Auberto then ran to another opening, fastened the tub to a rope, descended, and called, the water falling all the while in a perfect torrent. Five men came out; four entered the tub, and were saved; the fifth hesitated a moment, and was lost. As soon as they reached the surface, Auberto caused himself to be lowered again. Perceiving a man entangled in the timbering of the lower gallery, he drew him out, threw him into the tub, and was drawn up at the moment the water took possession of that part of the mine.

Auberto had saved six lives, and would have saved more, but no other point was accessible, the whole mine being then under water.

There was only one outlet remaining, and this had been formed by the breaking of the ground near the point where the waters were rushing in. Lights were seen shining there, and ropes were thrown in; but the violence of the waters increased, the ground fell in afresh, this last outlet became closed, and all the men in that part of the mine were drowned. In half an hour the interior of the mine was converted into a

lako. The air and gas in the mine were compressed by the weight of the water, and were forced out through fissures in the ground, producing the effect of gunpowder, throwing the earth to a considerable distance, and in some cases overturning houses.

Everybody in the vicinity rushed to the mouth of the mine, and an anxious and terrified crowd was speedily collected. The engineers and superintendents were first on the spot, and were speedily joined by the engineers and workmen from the neighboring mines.

No immediate relief is possible. Perhaps the colliery is only a vast tomb, for out of a hundred and thirty-nine men who entered the mine in the morning, only twenty-nine have escaped. A hundred and ten are scattered in the interior of the mine, some at one point and some at another, at different depths and in varying conditions. How are they to be found? and is it certain that even one of them is living?

A dike was made at the surface to keep out the water, and the engineers consulted the plan of the mine, in order to devise the surest and readiest means of relief. While this was being done, a young boy, who had previously been employed in the mine, entered one of the galleries, and, after knocking for some time on the walls, thought he could distinguish sounds answering to his own. He called his comrades, and repeated the experiment with the same result. The engineers were informed, and everybody hastened to the spot. M. Parsan, of the Imperial School of Mines, had arrived from Alais, to direct the work of salvage. He ordered everybody to maintain the most perfect silence, and then he made a signal by knocking with a pick at regular intervals of time. He has written an exciting account of these operations.

"With ears resting on the coal," he says, "and holding our breath, we soon heard, with profound emotion, extremely faint, but distinct and timed blows,—in fact, the miners' signal,—which could not be the repetition of our own, because we had only knocked at equal intervals."

Between the prisoners and their rescuers there was a solid

wall more than sixty feet thick, which must be cut through ; but the greater part of the miners were shut up in the mine. But volunteers were ready from the other mines, and soon the blows of the pick carried hope to the hearts of the prisoners. The work began at six o'clock on the evening of the 12th, at five different points in the gallery where the sounds were heard.

The five drift-ways were made towards the place where the sufferers were enclosed. One pickman at a time worked in each heading, and he was relieved at the moment when he began to feel wearied. He worked with all his energy, and the coal which he removed was carried away in baskets as fast as it was detached. The labor proved more difficult in consequence of a want of air, and it became necessary to put up ventilators. Sometimes the lamps would only burn in front of the air-pipe. At two o'clock on the morning of the 14th, the voices of the imprisoned colliers could be heard. "There are three of us," they said ; and they gave their names. The coal increased in hardness, and the heat became unbearable. All that day and the next the best pickmen went to the front, hewing the coal with all their strength, the prisoners all the while making themselves heard. Finally, at midnight of the 15th, one of the drift-ways was completed, and the three men were reached.

Only two were alive. The youngest was sobbing, the other was in a high state of fever, and the third, an old man, had been unable to survive the trying ordeal, and was found dead not far from his companions.

The two survivors were covered with blankets, refreshed with cordials, and carried to the hospital of the mine, where they were put in the care of the physician, who next day pronounced them out of danger.

The work of rescue had continued without intermission for seventy hours. On calculating the amount of rock and coal removed from the drift-ways, it was found that a full month would have been required, under ordinary circumstances, to do the work which had been performed in three days.

The most precise details of the circumstances of their confinement were given by the two rescued colliers. They were at work in a heading when the water was heard coming upon them. They then ran to the upper end of the gallery, where they were found—a narrow place with a considerable slope, and very slippery. With their hands and the hooks of their lamps they dug a little place in the shale to sit down in; the water was up to their feet, and they were in a sort of bell, in which the air was highly compressed. They felt a singing noise in their ears, and for a time they lost their voices. Their lamps went out for want of oil. They tapped with the heels of their shoes on the walls of the gallery to summon assistance. This sound was the one which was heard, but only after they had been imprisoned twenty-four hours!

Convinced that help would arrive, the eldest of the three, the one who was destined never to behold the light of day again, shed tears of joy. Another, mad with thirst, descended into the level with the water up to his armpits, in a vain search for a way through the rubbish; but he afterwards regained his place, being guided by the voices of his companions. The youngest, seventeen years of age, frequently fell asleep, and would have fallen into the water but for the help of his neighbor, who held him in his arms like a child, and thus saved him from death. At one time the noise of the ventilator connected with the operations of their preservers reached their ears, when they imagined that a new influx of water was about to occur, and they became discouraged. The old man was constantly active. Overcome by his efforts, he slid from his resting-place into the water, and was drowned without a struggle, and without uttering a cry. Frozen with horror, and held motionless in their places, the two others dared not move to his assistance, and they even refrained from announcing the accident to those who were working to relieve them. "There are three of us," they cried, when in reality only two were alive.

The one who suffered from thirst finally determined to move, but touching the dead body while drinking, he clambered

back again. Fatigue, bad air, and this fearful vicinity to a corpse, rendered him delirious, and he said to his comrade, "Come, let us leave this." The other was frightened, and in order to divert his attention, suggested that he should go and drink again. He went, and returned, striking against the dead body in passing. "The darkness," said he, "made the place more horrible than anything I had ever imagined."

In the mean time the water got lower in the level, but it was cold there, and the two captives remained in their places where the air was dry and warm, though constantly growing more impure. At last they were recovered, and carried into the light by their comrades. By a strange phenomenon they had lost all notion of time, and thought they had not been in the mine more than twenty-four hours. Other instances of a similar nature are recorded. Some miners of Hainault, who lived twenty-five days shut up in a mine during an inundation, thought they had only been there eight or ten hours.

While the operations for saving the lives of these two men were in progress, other works were undertaken, with the view of penetrating the interior at other points. Pits were dug where the miners were suspended from ropes for fear of explosions, while other workings, which had been injured by the flood, were repaired. One of the old shafts was undergoing repairs at the time of the accident. In ordinary times, fifteen days, at the least, were required to refit the engine, put up the ropes, and get everything ready. In this instance everything was done in four days: the pumping began on the 15th of October, and was not again interrupted.

The workmen continued to bore and dig shafts. On the 24th of October, thirteen days after the accident, the men working at the bottom of the shaft heard shouts. Three men were still alive, only separated by rubbish and a vacant space of ground from the point where the workings were in progress. Disputes arose as to who should save them, each man desiring the honor of going down first. At last the favor was

given to one of the overmen, who descended and found two men, who clung to him, and begged for relief. He encouraged them, and fed them from a can of broth which he carried. In a little while the timbermen made the place secure, and the captives were brought out.

A third prisoner, a child, was still left. His comrades described the place where they had buried him in the coal to keep him warmer. The engineer hastened to the spot, and seized the child, who embraced him and wept; the three were taken at once to the hospital, where they soon found themselves in the company of the other two, who had already been saved.

Like their comrades whose story I have just told, the three last colliers had fled before the water from the first moment of its breaking in, and finding a rubbish passage stopped up, they despairingly made an opening into it. They afterwards clambered to the heading of the gallery as a last refuge. Their lamps were out, but they heard the water rise, and retreated before it. The noise occasioned by falls, and the breaking of timber, as well as the sound of explosions caused by compressed air, reached their ears distinctly, like a frightful tumult, which seemed to announce to them the last hours they had to live. One of them had a repeating watch, which he caused to strike several times; but it stopped on the morning of the 12th of October at a quarter to three o'clock. They heard the noise of the tubs plunging into the water in two adjacent shafts. They conceived the idea of reckoning the progress of time by means of the short intervals of rest caused by changing the ganga. They thus formed a very near guess at the period of their captivity, which they reckoned at fifteen days, instead of thirteen.

To satisfy their hunger, they ate the rotten wood of the timber supports, which they crumbled in water, and then devoured, having previously eaten their leather belts. They could quench their thirst at will, and that sustained them. Afterwards the water rose to where they were, and wet their feet. Subsequently it fell, and then they thought of fastening

one of their boots to a string and drinking out of it. Finding the water retiring, the child resolved to go in search of an outlet. Swimming or holding on by the walls, he groped his way along, but found nothing. Exhausted and chilled with cold, he returned to his companions, who lay close to him to warm him, and then covered him with small coal, in which position he was found.

These men were liberated after being shut up thirteen days: the temperature, the pressure, and the composition of the air in which they were found, were favorable to life, and, moreover, they had the means of quenching thirst. Under such conditions, it may be possible to live a month. Our nature can endure a great deal when it is compelled to exert itself. The energy and tenacity of life are great, and few men know how much they can undergo until they are driven to make the experiment.

Only five were saved in this catastrophe at the mines of Lalle. All the rest of the one hundred and ten perished. Drainage of the mine was steadily pushed amid innumerable accidents, and the colliery was free of water on the 4th of the following January, fifty million gallons of water having been removed. During the interval the bodies were slowly discovered, and heart-rending was the spectacle which the mouth of the shaft presented as the bodies of the victims were drawn up, relatives and friends pressing forward and endeavoring to recognize or guess at some well-known face. And the scene in the mine, as the water slowly fell and the bodies were found floating on the surface with the light thrown upon them by the lamps of the searchers, is described as horrible in the extreme.

From the managers to the humblest workman, everybody connected with the rescue did his full duty. Every man vied with his neighbor in doing what was needed, however difficult it might be. All the directors of mines in the Department of the Gard, assembled, and brought their overmen, surveyors, and workmen, who, in every instance, gave proof

of a courage and self-denial which never failed for a single moment. The government bestowed crosses and medals upon those who rendered material assistance in the rescue, and the sad occurrence will long be remembered in and around the mines of Lalle.

## XV.

### THE WIELICZKA SALT MINES.

THE GREAT WIELICZKA SALT MINES, THE LARGEST IN THE WORLD. — THEIR HISTORY. — EXTENT AND PRODUCT. — DESCENT INTO AND EXPLORATION OF THEM. — WHAT IS TO BE SEEN. — MINERS AT WORK BLINDFOLDED. — WONDERFUL CHAMBERS. — GLOOM CONVERTED INTO SPLENDOR. — BANQUETS IN THE BOWELS OF THE EARTH. — THE INFERNAL LAKE. — HUMAN DEMONS. — AWFUL APPARITIONS. — EXTRAORDINARY NARRATIVES.

THE Wieliczka salt mines in Galicia, Austrian Poland, are probably the largest and most productive on the globe. They are generally called the Cracow mines, though they are ten miles from the ancient capital of Poland — perhaps because Wieliczka (pronounced *Vyalitchka*) is so much harder for the tongue to master. They are connected with the mines of Bohemia, — this town is some eighteen miles east of Wieliczka, — and extend over a space two miles long, and nearly one mile broad, with a depth varying from six hundred to eleven hundred feet. The time of their discovery is unknown; but it is held that salt was obtained from them in small quantities as early as the eighth century. That they were worked in the beginning of the twelfth century, when they belonged to Poland, there can be no manner of doubt. Less than two hundred years later, they had grown so productive, that Casimir the Great established rules respecting them. In 1656 they were ceded to Austria, and twenty-seven years after recovered by John Sobieski. Austria again obtained possession of them at the first dismemberment of Poland, and has held them from 1772 to the present time, except for the six years preceding 1815. They have been a great source of wealth to the empire, and from them the Polish monarchs have drawn their principal revenues. So important were they considered, that, at each royal election, the Polish nobles stipu-

lated that the salt of Wieliczka should be furnished to them at cost. The mines have never yielded so abundantly as at present; the annual product being, I have understood, about six hundred thousand tons, which, at ten dollars a ton — the usual market rate — creates a revenue of some six million dollars. As many as fourteen or fifteen hundred men, and as many as six or seven hundred horses, are generally employed in extracting the salt, which is found in lenticular masses inclined at a high angle. The salt varies very much in purity. Some of it, called *green salt*, has six or seven per cent. of clay; another kind (*spiza*) is mixed with sand, and the third and best sort (*szybik*) lies at the lower levels in unadulterated and beautifully transparent crystals. The Bohemian mines employ six or seven hundred workmen, and yield from two hundred to two hundred and fifty thousand tons of salt yearly. The figures I give, I obtained on the spot, and they may therefore be regarded as accurate.

A year or two ago I made a special journey from Vienna, in order to go through the Wieliczka mines, in which I had felt a great interest ever since the geography of my boyish days had introduced me to their acquaintance. I had no trouble in procuring a ticket of admission at the Chateau of Wieliczka; and, well supplied with kreuzers for the workmen, I changed my clothes, and announced myself ready for the descent. There are ten or twelve shafts, but I asked to enter by the one the miners generally used. This is rather primitive, — material improvements having been made in some of the others, — or rather the means of descent are primitive. I was assigned to the charge of two miners, who were as stout, and hardy, and grim-looking as if they had toiled in the bowels of the earth — as no doubt they had — nearly all their lives. They were provided with torches, and they handed me one, at the same time showing me a place in the cap I had put on into which I could thrust the torch for convenience in carrying it. At the top of the shaft was a kind of windlass for letting us down, the construction of which I did not examine. A long vertical iron bar was in the centre of the shaft, and about this

bar was a steel ring, to which iron baskets or chairs were fastened by chains.

In these we took our seats, our legs hanging down, while we held to the chains above. At a given signal, the steel ring slipped along the bar, and we went smoothly and steadily down. The sensation very closely resembled that of descending a well. The darkness of the pit, which the feeble light of our torches made still darker, and the flickering shadows lent a certain gloomy picturesqueness to our perpendicular journey.

I might describe the anxiety and apprehension which I felt lest the chains should break, or I should be thrown out of my narrow seat into the great blackness below; but, as I did not have any such feeling, and as I question seriously if men of nerve or experience have it either, I will not try to render myself the hero of an imaginary situation.

I had supposed we should go to the lowest depths of the mines, but we stopped when we had descended four or five hundred feet, and got out. I learned then that the mines were full of wooden bridges and staircases by which the different levels were reached, and that by these communication was kept up with distant quarters. Some of the other shafts, as I was informed, are much deeper, requiring to be on a level with the galleries where the excavations are working. I had been taken down that particular one in order that I might see the entire arrangement and construction of the mines.

My guides were Poles; but I soon found that they spoke German, of which I had sufficient knowledge to ask ordinary questions, and understand the answers thereto. We set out on the second part of our journey, one of my conductors in front, and one behind; each of us carrying a torch in the left hand, at a forward point of elevation, so as to furnish as much light as possible. We threaded several passages which seemed to be veined with quartz, but which, on examination, I discovered to be the green salt. We went over bridges, down staircases, to the right and to the left, passing

various chambers and avenues, until my head became completely turned, and I could not have retraced my way to save my soul. I observed, however, that our general course was downward; and finally we arrived at a large chamber, represented to be seven hundred feet below the surface. This chamber had been abandoned because all the salt in the stratum had been obtained; but it had been arranged like a chapel, containing an altar, several crosses, and some images of saints, all made of rock salt. When the light of the torches was reflected on these natural objects, the effect was superb. The crystals glittered like diamonds, and only a little imagination was needed to transform the rude vault into an apartment of Aladdin's palace.

After I had sufficiently admired the chapel, we resumed our excursion over more bridges, down more steps, and through more passages, until we came to what the guides termed a river. It was not a very remarkable stream, reminding me, in its smallness, of the renowned Rubicon, or the Manzenares, when the latter does not happen to be altogether dry. Such as it was, however, we stepped into a rude little boat and crossed over, where we were soon on another bridge, and crawled down another staircase of the most rickety and tumble-down description.

I was surprised that we had met so few workmen, and mentioned my surprise to the stalwart fellows with me. They informed me that the part of the mine through which we had passed had been worked out, and that the miners had gone farther down, following the strata containing the salt. In half an hour or less, we encountered a number of miners hewing out a new passage. They were naked above the waist, and some of them wore the garb of southern savages, the high temperature rendering clothing uncomfortable, if not superfluous. They used picks and crowbars, and, in the beginning of their excavations, would lie down on their backs, and strike out the salt with their implements, covering their eyes with pieces of leather, to prevent injury from the falling fragments. It is not often that men can work well with

DESCENDING THE SHAFT--WIELICZKA SALT MINES.

CHAPEL IN THE WIELICZKA SALT MINES.

their eyes blinded, but there they succeeded better without seeing than with seeing. As they increased the cavity to sufficient height, they stood up and labored in the regular way.

There was now no lack of miners, who were visible on every hand, delving hard, steadily, and silently. Their toil is excessively monotonous and severe. As most of them have done nothing else, and as they are densely ignorant, they are not tortured by brighter memories, nor haunted by pictures of the possible. Their earnings are miserably small — not more, I believe, on an average, than thirty to forty cents a day, and working about twelve hours out of the twenty-four. Out of these wages they usually have families to support; for it is as true in Austria as in every other land, that extreme poverty incites to marriage and prolific paternity.

The one so-called river which we had crossed was an introduction to a number of others, all of them small, and more like pools than streams. The two workmen generally pushed a little boat over with poles, though they sometimes used oars very much in the same fashion as the Lethe and the Styx in the Mammoth Cave are crossed. These pools or rivers are formed by percolations of water through the strata, and in them the miners have not unfrequently been drowned.

Our onward progress soon brought us to a large open space — it must have been a hundred feet high, and nearly two hundred in length and breadth — called the Chamber of Letow; and about half a mile farther is another of still greater dimensions, known as the Chamber of Michelawic. These chambers, which were excavations, were decked out in all the splendor of rock salt. There were chairs, candlesticks, chandeliers, statues, thrones, columns, and altars composed of the chief staple; and when lamps were lighted in the natural hall, the rays of light were reflected from thousands of points, and the whole interior shone in sparkling splendor. It recalled to my mind the Crystal Saloon, as it is styled, in the New Palace at Potsdam, when it is illuminated on some special occasion.

I had brought with me from Cracow some small fireworks, such as red lights, serpents, and Catharine wheels, for the purpose of burning them in the mines; and this was evidently one of the places for their use. I handed some of them to the guides, and in a few seconds the cavern, more than eight hundred feet under ground, was ablaze with different colors, and showers of radiance. To produce a greater effect, all the lights were extinguished, and then another pyrotechnic exhibition began. The result was marvellous. One would have imagined that the moon, and stars, and sun, had all burst through the earth, that divided us from the upper air, and were gleaming and flashing under our very eyes. The rock salt was as so many prisms, revealing all the lines of the rainbow, and coruscating like a vault studded with jewels.

Such glorious radiance I had never witnessed under ground, nor had I deemed such radiance possible there. The extraordinary contrast between the pitchy darkness and the magnificence of the illumination can hardly be expressed in words. It was as a sudden plunge from a Memphian night into a tropical noon, and the first effect was almost blinding. I have witnessed, in my time, numberless exhibitions of fireworks on a grand scale, but none of them furnished so splendid a spectacle as the few pieces burned in the depths of Wieliczka. So much for accessories. Rock salt has its æsthetic as well as material uses; and, confronted with common lamps and common fireworks, it assumes the beauties of Dreamland and the shining glories which theological rhapsodists have associated with the Celestial Kingdom.

The Chamber of Michelawic is consecrated, I was told, to St. Anthony, and I think the saint would show his much boasted power,—not to speak of his kindness,—if he would relieve the poor devils who so implicitly believe in him from their need of wasting toil in those dreary caverns. On the 3d of every July, grand mass is celebrated in the chamber,—then regarded as a chapel,—and is followed by a banquet, in which the principal officials of Cracow and the directors of the mines participate. At that date the workmen are given a

partial holiday, and receive trifling sums of money, that are quite enough to render them happy, and to make them wish that every day of the year were the 3d of July.

Now and then some of the members of the imperial family of Austria make a visit to the mines, the superintendent being notified beforehand of the important event. Great preparations are then made. The main passages and different chambers of Wieliczka are brilliantly illuminated; the miners are relieved from work; festivals are held in the villages, and presents are given to the people in the name of the House of Hapsburg. One of these royal visits had been made a few weeks before mine, and many of the peasants were still speaking of it in terms approaching ecstasy. How merely relative is everything we give the name of pleasure to! The poor Poles and Austrians, relieved from twelve hours of their customary labor, and given a few unexpected kreuzers, are made happier than many men would be in the midst of material blessings, and surrounded by the answered wishes of their hearts.

One of the principal sights in the mines is the Infernal Lake, a body of water seven or eight hundred feet long, some four hundred broad, and fifty deep. Above and around it is a vast cavern, that might be the abode of the gnomes and goblins once supposed to inhabit the inner parts of the earth. The atmosphere of the place is oppressive, and its every suggestion superlatively dismal. It is infernal in seeming as well as in name; and if the Hahnemannic principle be true, that "like cures like," melancholy spirits, after a visit there, would be converted to cheerfulness and content. The deep gloom of the vault at once prompted the benefit it would derive from fireworks; and so I sent a number of serpents whizzing through the thick air, and ignited blue and red lights, until I had wrought a perfect transformation. The scene was strikingly theatrical, only far more vivid and impressive than anything could be on the stage. If I had heard a chorus of imps, or had seen blue, yellow, and green devils, of the most improved spectacular pattern, dancing in

horrid measures on empty space, I do not think I should have been surprised. Assuredly there could be no evil spirits anywhere if they were not there. Never could they find a more inviting region for the display of their malignity, or a more attractive rendezvous for the perfection of their schemes against the human kind.

A boat was ready for our embarkation upon the inky bosom of the lake, and we rowed out upon it with our gleaming torches, and our voices returning to us in the dreariest echoes. I was still thinking of the charms of the demons, when, of a sudden, the strongest and wildest sounds burst from the cavern. I strained my eyes, but in the thickness of the darkness I could descry no forms.

Groans, and shrieks, and horrid laughter rose, and reverberated through the vault, until — had I been the least superstitious — I should have become convinced that I had reached the Orthodox Tophet at last. The sounds were as weird as mysterious; but I concluded that it must be part of the exhibition, for which I was expected to pay at the usual rate, and I soon discovered that I was right.

It is the habit of the workmen, when strangers make a visit to the Infernal Lake, to go out in boats, distribute themselves at different points, and set up this diabolical yelling, that a proper impression may be made upon the visitors. That they acquitted themselves handsomely of their task I can testify; for a more discordant and abominable sound it has never been my fortune to hear.

The howls of the miners finally lessened in volume, — probably from exhaustion, — and I could distinguish, at the end of the wild refrain, the words "*Gluck Auf! Gluck Auf!*" (Welcome! Welcome!) There was something singularly sardonic in the idea of being welcomed to that dreary depth. Such a welcome the demons of the fabled Pit would extend, I should suppose, to the doomed and damned. The effect of the cheery words was more dispiriting than if they had been of evil omen.

While we were rowing grimly about on the lake, "*Gluck*

GETTING OUT SALT.

ILLUMINATION OF THE INFERNAL LAKE.

*Auf*" assumed a fiery form in letters of flame, about a hundred feet in front of us. This seemed to be done by magic; but a little reflection taught me that lamps must have been hung in the shape of an arch over a narrow part of the cave, and that, while we were otherwise occupied, the workmen had lighted the lamps. The very moment the illumination was made, the harsh chorus began again, louder and more lugubrious than ever. I set off the last of my stock of fireworks, and amid the sulphurous blaze and the infernal din we floated back to the shore, when I was informed that the entertainment was over.

In a few minutes the chorus of demons appeared in the shape of hard-featured, muscular, ill-looking miners, asking for kreuzers, in consideration of the efficient aid they had lent to the depressing performance. As I have said, I was well supplied, and I could play the part of My Lord Bountiful with very little expense. Three or four kreuzers were enough to make the stolid faces of the miners brighten as if they had fallen into the possession of pecuniary independence. What they could purchase with such a trifle, I could not comprehend, for I felt that I should be no better off, in my own judgment, with fifty times the amount I had bestowed as gratuities upon the gnomes of Wieliczka.

My two guides denounced the begging unfortunates for their mercenary conduct in a vile Polish *patois*, which must have consisted chiefly of curses. I am sure they mentioned mercenary conduct, which must have been an ironical expression, since none of the wretches, in asking for *trinkgeld*, received, at the highest, more than four or five cents. The rebuke reminded me of the familiar instance of the parsimonious father who handed his boy a penny, accompanied by the precaution that he should not make a beast of himself, or of the over-thrifty husband, who, having been asked for a little money by his wife, wished to know what had become of the dollar and a half he had given her a month before.

The majority of the miners are Poles, unable either to read or write, to whom labor in the mines has been an inheritance

— their sole one, indeed. Many of them have never been five miles from home, nor do they expect to be. They are rooted to the spot by the necessity of toil and their narrow circumstances. Some of the workmen are Austrians, and they are usually more intelligent, or rather less ignorant, than the others. After a few years of service, they often leave Wieliczka, seek a larger field of labor and a better kind of employment. But the Poles, possessing a certain kind of stupid contentment, appear to have no ambition, and no future. I ascribe this partially to their loss of nationality, than which no greater calamity can befall a people. It robs them of their individuality, impairs their energy, and depreciates their self-esteem. They feel that they are deprived of what they have a right to enjoy, and that they are likely to be despised for a misfortune for which they are not directly responsible.

Nearly all the miners reveal in their features and expression the hard fate that has attended them. They have all the marks of undevelopment, all the traces of an animal and undisciplined nature. Mind, in the strict sense, is omitted in their composition. They are merely machines of flesh and blood, obeying physical instincts, and impelled by the law of self-preservation.

Years ago, the Austrian government used to condemn political prisoners to a term of service in the mines, sometimes extending through life; but of late this practice has been abandoned, and now all who work are regularly paid, and free to go or stay, as they like.

Going out of the mines, I followed almost the same course that I had coming in. Altogether I spent some six hours underground, and might have spent weeks there, had I been inclined to exercise, since the combined length of its excavations and passages is said to exceed three hundred miles.

Accidents are uncommon in the mines, not averaging more than thirty a year, and few of these are fatal. They occur either from falls, or from being run over by the cars drawn to and fro by horses. These cars run on tracks from the place where the salt is dug out, to the mouth of the shaft, and

thence the salt is drawn up by machinery to the surface of the earth. I had made my entrance through the parts that had been excavated and abandoned, that way having been selected to give me a clear idea of the progress of the work, and the gradual deepening of the mines. I observed afterwards, at the lower levels, where hundreds of men were actively employed, how the salt was thrown into the cars, and then carried by the railway to the principal shafts.

Wieliczka is impregnated with tales and traditions, natural and supernatural. Of the latter the peasants relate many, and believe them sincerely.

One of these is, that a miner, who had been sent to Cracow, found, on his return, an image of the Virgin, which, as the narrative runs, had been stolen by the devil from the cathedral of that city, and dropped by the wayside; St. Paul, or some other saint, having detected the theft, started in pursuit of the diabolical thief. A poor workman picked up the image, which was of wood, and knowing it to be sacred, carried it back to the church in the midst of a storm. When he had reached the edifice, summoned the priest, and given it into the holy man's hands, the inanimate image suddenly shone with celestial light, sped through the air, and took its accustomed place at the altar. The awe-struck priest and peasant fell upon their knees in prayer, and when the latter arose, there was an illuminated cross on his forehead. By inspiration he understood that whenever this symbol was visible, it was to indicate good fortune; and going back to the mines, the cross proved to be very beneficial in pointing out the richest veins of salt. The man walked under ground, and whenever his forehead kindled with the divine token, it was a certain sign that the spot on which he stood would yield richly. He received handsome presents, and numerous sums of money from the government, and so excited the envy of his former fellow-workmen, that they entered his cabin one night, and knocked out his brains. His murderers disappeared mysteriously the next day, and it was supposed, in the Galician village, that they were carried off by demons.

The image in the cathedral was heard to wail at the time the crime was committed, which was probably intended as a warning, though it did not do any good to the victim, at least in this world, however much it may have benefited him in the next.

I cannot see the moral of this monkish story, unless it be that persons who find things should not return them. If the miner had taken the image home, and split into kindling-wood, he might have lived much longer, and died peaceably in bed at a ripe old age.

During one of the periodic Polish revolutions in Warsaw, a prominent nobleman, resident in the city, and the leader of the insurrection, had volunteered to proceed to St. Petersburg, and assassinate the czar. The government spies detected the plot before it was mature, and went to the dwelling of the Polish conspirator to arrest him. He had been apprised of the discovery, and knowing that he would instantly be executed, he had been wise enough to flee from the town. He was sought for everywhere, for the authorities considered him extremely dangerous, and felt confident, from his character, that the emperor would not be safe while the desperate noble lived. All the subtle detective machinery of Russia was set in motion to hunt up the fugitive Pole, but all to no purpose; and the emissaries of the government, after a year of unexampled activity, abandoned further effort. Potzoporowsky, the name of the arch rebel, feeling that he would not be secure anywhere on the surface of the continent, conceived the happy idea of going below it. He proceeded in disguise to Wieliczka, claimed to be a native of Vienna, and was hired as a miner, at thirty kreuzers a day. He labored most faithfully, and was considered an excellent workman, strangely preferring, as was thought, to remain in the mines, even when he might have been enjoying the sunlight. Nobody ever dreamed of looking for Potzoporowsky a thousand feet under ground; and there he remained for fifteen months. Then he applied for his last week's pay, saying he had met with an injury that would prevent him from working for a lit-

tle while, hurried to Vienna, thence to Constantinople, and finally to Smyrna. There he resumed his correspondence with some of the former conspirators, and had perfected a plan for a new revolution, when he was seized with cholera, and died.

During the latter part of the eighteenth century, a scientist of Radour was implicated in a conspiracy to defraud the Russian government of several millions of roubles by means of forged army orders, and sentenced to ten years' exile in Siberia. He asked, as a special favor, that he might be sent, instead, to Wieliczka, where, he affirmed, his scientific knowledge would be of use in separating the green salt from the clay, with which the directors of the mines were then having considerable trouble. Prompted by interest, the government granted his request, and, the fifth day after he had entered upon the service, he induced one of the superintendents to visit a new passage in process of excavation, crushed his skull with a lump of rock salt, put on his garments, and escaped. He had always been regarded as a purely intellectual man, absorbed in his studies, and his deliberate taking of another man's life only shows how sweet liberty is to all of us, and of what desperate deeds we may be guilty to regain the freedom we have lost.

From 1825 to 1851, one of the most vigorous and enduring miners was Johann Gerbreitz, a German, who, in all that time, is said never to have missed a single day's work. He was a great favorite, on account of his kindness of heart and uniform good temper, especially with the women of the village, who, whether young or old, manifested a great deal of fondness for him. When in his thirtieth year he married Elisa Dosbrinski, a cobbler's daughter, regarded as one of the prettiest girls in the town. They lived together so very happily that they were considered a model pair. They were never known to have even those slight differences which are not uncommon to the most sympathetic and harmonious couples. They seemed wholly devoted to each other, and though Johann had been something of a flirt before he became a Benedick, nothing

of the kind could be charged upon him afterwards. Everybody declared he was a manly and noble fellow, and that his serenity could not be ruffled.

In his fortieth year a fragment of rock fell upon him, and killed him instantly. His wife was wild with grief at her bereavement, and all her neighbors lamented, sorely too, because Johann was a loss to the village that could not be supplied. The children of Wieliczka had learned to look for his smile, and little acts of kindness, — he was a Rip Van Winkle of Austria, without Rip's infirmities, — and literally cried for him when he appeared in the streets.

After the poor fellow's corpse had been brought to the stricken home, it was discovered, to the amazement of the whole town, that Johann was a woman; and it is to be presumed that he had never been anything else. The secret of his sex had been most carefully preserved, and it would never have been thought, from any outward indication, that it had been shared even by his spouse. This is an excellent proof, if proof were wanting, that women can keep a secret, and that there are some things which even the busybodies of a village cannot find out. The story of the man-woman Johann Gerbreitz is still told at Wieliczka, along with many other curious histories, of which specimens have already been given.

Like the great capitals, the mining town of Galicia has its comedies and tragedies, its lyrics and its epics, perhaps trifling in themselves, but of wondrous moment in its too partial eyes.

## XVI.

### CORAL CAVES IN THE PACIFIC.

ISLANDS OF THE PACIFIC OCEAN. — CORAL REEFS, AND THEIR FORMATION. — ROMANTIC STORY OF A CAVERN. — HOW IT WAS DISCOVERED. — AN ELOPEMENT, AND EXERCISE IN DIVING. — LOVE AND TURTLES. — A FEEJEEAN VENUS. — A DISTRACTED FATHER, AND WHAT HE DID. — WAR AND CANNIBALS. — A BATTLE IN THE WATER. — KILLED BY SHARKS. — A MAIDEN'S GRIEF. — THE PERIL OF A LOVER. — VICTORY AND MAGNANIMITY — SURPRISING A FATHER-IN-LAW. — END OF A SUBMARINE COURTSHIP. — "BLESS YOU, MY CHILDREN, BLESS YOU."

THE islands of the South Pacific Ocean are mostly of volcanic origin, having been produced by a sudden upheaval from below the surface of the water. Exception must be made, in this connection, to the coral islands and reefs which have been built up by the coral insect, working patiently through unknown centuries. The coral insect does not work at a greater depth than two hundred feet, — so the *savans* tell us, — and he ceases his labors as soon as he reaches the surface. Consequently, the coral islands and reefs are but just above the sea-level, except in cases where they have been lifted by earthquakes or other internal action, after they have been completed. Many of these coral islands are of circular form, with an opening which will admit the passage of boats, and sometimes of ships. The waves break on the outer edge with that long, steady swell peculiar to the Pacific, but on the inside the water is as calm and peaceful as that of a mountain lagoon. Sometimes the coral reefs have been formed around the volcanic islands so as to encircle them completely, except at a single opening. In such cases they make excellent harbors between the reef and the island: the harbor of Tahiti is a splendid specimen of this kind of work. The reef surrounds the island in such a way as to make a lagoon of still

water, like the moat around a castle. The entrance is deep, and sufficiently wide to admit ships of every size.

On many of the volcanic islands there are caverns, some of them of considerable size, and often of great depth. Runaway sailors frequently hide in these caverns, and they are also resorted to by the natives in times of warfare. There is a cavern in the Island of Hoonga, one of the Tonga Islands, which has a romantic history from the use that was made of it by the man who discovered it.

One day a young chief of Hoonga was out on a fishing excursion, and caught sight of a large turtle. The turtle dived, and so did the chief, leaving his canoe floating on the surface of the water. The natives of nearly all the Pacific islands can swim like seals; they are in the water and learn to swim about as soon as they learn to walk. It is commonly said that a Feejee baby will swim instinctively, like a puppy or a kitten; but this is not strictly true. The natives think nothing of swimming a mile or two at a time, and they frequently get up swimming matches, in which they show great speed and endurance. The accomplishment is not confined to the sterner sex; girls and women swim as well as boys and men, and frequently the girls carry away the prizes in the swimming matches. It is proper to say that they are not as elaborately dressed as the young ladies of New York and Paris; on some of the islands nobody wears any clothing whatever, except a little oil rubbed over the skin, to keep out the water. Since the missionaries settled in the South Pacific, more attention is paid to dress than formerly; but the quantity worn is surprisingly small, and would not admit the wearers to a fashionable party in America.

The young chief dived for the turtle, and the two had a lively race. The turtle went into a hole in the rocky shore, and the chief went after him. The turtle disappeared, and the chief rose to the surface of the water to regain his boat. But instead of finding himself in the open air, he was in a cavern, a hundred feet wide and twice as long, with a dome as high as the roof of an ordinary church. It was lighted from

the water and from a few crevices in the rock, where nobody could reach them. On one side there was a floor of solid rock, smooth as the best sidewalk of a city, and evidently the resort of the turtles of that neighborhood. He explored the cavern, and concluded that he had hit upon a good thing, and would keep it to himself. Taking a new twist in his neck-tie, adjusting his collar, and seeing that his diamond pin was well fastened, he dived into the water, swam outside, and rose near his canoe. With his thumb on the side of his nose, he paddled home, lighted his gas, and sat down in his easy-chair.

He was not a married man, but he had hopes in the direction of matrimony. He loved the daughter of an old chief whose tribe was then at war with his own, and as long as the war lasted there was no hope for their union. His tribe was preparing for an assault upon the other, and the economical custom prevailed there of eating all who were killed or made prisoners. His tribe was more powerful than the other, and if the battle should be on the side of the stronger party, they would have the pleasure of devouring the vanquished ones. He had no particular objection to eating, or seeing his friends eat, the body of his father-in-law, and especially that of his mother-in-law, — many a married man in America can understand his feelings, and sympathize with them, — but he did object to seeing his bride roasted or fricasseed; so he studied out a plan to save her from the gridiron or stewpan.

He managed to communicate with her the next day, and told her to meet him at a certain place on the shore, at an appointed time, where he would be ready with his canoe. He was there on time, and she came, with her waiting-maid, who carried their entire wardrobe in an old bottle. A quart of cocoa-nut oil was sufficient to dress her for several days, and it did not take long to pack up. They entered the canoe, and the chief paddled them to the cave, which they reached just as the sun was rising.

"Dress yourself, my dear," said he, as he ceased paddling, "and have your maid do likewise."

She poured out a handful of the oil, and rubbed it over her

porphyry-colored shoulders, so that she could slip easily through the water. Her maid followed her example, and then fastened the bottle to a string around her neck.

"Now, if you're ready," said the lover, "follow me."

"Ready," was the response.

He went overboard, and mistress and maid went after him.

Down they dived like three dolphins, the princess keeping close at his heels, and the maid following the princess.

The lady had some misgivings when they entered the hole in the rocks, but she concluded that her lover knew what he was about, and therefore she asked no questions. In fact, she could not talk at that time, as any one familiar with efforts at subaqueous conversation can testify.

They rose in the cavern, and clambered out upon the solid floor, disturbing half a dozen turtles, and capturing one of them just as he was sliding off into the water.

The princess was delighted, and so was the maid, who thought the place one of the jolliest she had ever seen. They talked about the best plan to arrange the house, and laughed to think what a commotion her absence from home would create. After an hour or so he left her, promising to bring some furniture, and fit up the establishment, so that they might start at housekeeping in good style.

There was a precious row in Oklingee's palace when he found that his daughter had disappeared. He searched through his village, but could find no trace of her; and, after several hours of fruitless endeavor, he came home, and for the first time discovered that she had taken the bottle of cocoa-nut oil, and then he knew that she wouldn't return in a hurry, and that her absence was premeditated. He did not know that anybody was in love with her, but very naturally suspected that she had eloped with some young man. His rage was great, and he ordered all the youths of the tribe to be sent before him.

All came, and were closely questioned. None of them knew anything about the princess and her flight, and all were able to prove where they were the night before. His anger

was partially appeased when some one brought in a prisoner freshly caught, who was immediately killed and served up for dinner.

Oklingee's wrath turned to grief, and he determined to bring on a great battle at once, by way of distracting his sad thoughts. Moreover he suspected that his daughter had been stolen by some of his foes, though his spies brought him word that she was nowhere to be seen in the camp of the enemy.

Meantime the lovers were happy in their new home, though the visits of the young chief were never of long duration. He carried her a liberal supply of mats for bedding, and kept the place well stocked with cocoa-nuts and other things good to eat. Anything that would be injured by the water was carefully wrapped in a shark's skin before it was taken to the cave, and as the skin was quite water-proof, the articles did not suffer in transit. It was no easy work for the youth to dive and swim into the cavern with a bundle fastened to his neck; but love gave him strength, and he was ready to undergo any hardship for the sake of his heart's idol. She reciprocated his kindness, and arranged all the mats and other furniture so that the house was quite comfortable, and even luxurious.

The turtles did not approve of the invasion of their home, and made up their minds not to live in the society of the moonstruck couple and their servant. As the latter showed no disposition to leave, the former abandoned the place, though now and then one made his way there and climbed upon the rocky floor. When the splashing of the water denoted the approach of a turtle, the princess and her maid would quietly slip aside, and leave him to pick out the spot he wanted and go to sleep. They would then stealthily approach him, and turn him on his back, where he would be helpless. Cutting off his head was the next step, and by the time the chief made his appearance the turtle would be ready to take home. He was thus able to account to his friends for his absence, as he took a turtle home nearly every day, and was greatly praised for his skill in the chase.

One day a fellow who had been unfortunate in turtle hunting, and taken nothing for a fortnight, determined to follow the chief, and find out where he had so much good luck. He paddled his canoe silently along, keeping some distance in the rear, so that he was not noticed by the lover. The latter reached the cave, and was so intent on seeing his lady love that he did not think to look around. Taking a bag of cocoa-nuts, he dived and rose as usual. The other waited a long time for his reappearance, and at last was rewarded by seeing him come up dragging a turtle, which he lifted into the canoe. Just as he was picking up his paddle, he discovered the spy, and knew that his secret, or at least a part of it, had been found out.

The other laughed, but his laugh was brief, as the lover went for him, and there was every promise of a fight. The canoes met with a crash, and the men grappled and fell into the water. Their struggle was long, as neither had any weapons or clothing, and their oily skins did not offer good holding-ground for their hands. At last the chief had the spy by the throat, and at the same time struck him a violent blow on the nose, so that the blood spurted out.

The waters of the South Pacific swarm with sharks. Some of these grow to a considerable size, and are strong enough to seize a man and kill him. They rarely attack the natives; there seems to be a friendliness among the sharks and the natives, as the latter can swim among them with almost complete safety, while a white man would be caught in a moment. It sometimes happens that a group of natives will be bathing and frolicking in the water with sharks all around, as inattentive as though nothing were near them. But let a white man join the party, and he will instantly attract the sharks. A white cloth thrown into the water will bring them around; anything white seems to draw them and receive their attention. It not unfrequently happens that sailors who have incautiously put their naked hands or feet into the water over the sides of a boat have had them bitten off by sharks.

Blood also attracts them, and where there is blood, they make no distinction between natives and foreigners. In the present instance, the lover had drawn blood from his antagonist, and it instantly occurred to him that both their lives were in danger if any sharks were around. He released his hold, dived under his canoe, and swam away a hundred feet or more, so as to be out of the vicinity of the blood he had drawn.

As he rose to the surface and looked around, he saw that the spy was just recovering from the force of the blow. His head was above the water, and his hands were moving as if he were slowly swimming towards the rocks. Suddenly he gave a shriek, and disappeared as if drawn under, and the lover then knew that his expectations were not incorrect. But with a taste of blood the sharks would be likely to attack him, and he therefore swam farther away, and climbed upon a small reef just even with the surface.

Fortunately a light wind came up and blew his canoe towards him. When it was near the reef he swam out and reached it, and then paddled home with his turtle. For two days he did not go out again; partly through fear that the sharks might be around the spot where his antagonist was killed, and partly in order to allay any suspicions that his previous movements might have aroused.

When he next visited the cavern, he found his princess greatly distressed, and almost dead with grief. Soon after his last visit her maid took it into her head to go outside. She dived into the water, and rose close to the foot of the cliff. The lover had been gone an hour or more, but an empty canoe was floating not far away, and near it a dozen sharks were quarrelling over something which she naturally supposed was the body of the owner of the bark. Of course she thought that the canoe must belong to the young chief; and when she returned and told her story, it is no wonder that the princess went into hysterics. On the next day he came not, and they then knew that he was lost. Their grief had been great, and so were their surprise and relief at his return.

He went and came safely. Next day the warriors went out to battle, and the stronger tribe was victorious. The slain were eaten, and the prisoners were reserved to be killed whenever wanted. Among the latter was Oklingee. The young chief had shown great courage in battle, killing two of the fattest and tenderest warriors with his own hand, and his people were consequently inclined to do the handsome thing by him. Oklingee was old and lean, and the young chief easily persuaded his people to let the patriarch live. The old fellow was gratified at being saved from the hash-mill for the present, and asked the youth what he could do for him.

"Give me the hand of your daughter," said the young man, respectfully.

"Certainly, my dear boy," said Oklingee; "not only her hand, but her entire self, provided you can find her. She has eloped, and I don't know where she is."

"I will show you," said the youth, as he led his prospective father-in-law to his canoe, and seated him on a mat in the bottom. Then he summoned his friends, and together they paddled their light canoes in a gay procession over the water. Near the mouth of the cavern they halted, and the chief jumped overboard.

While all were wondering at his strange behavior, he reappeared with his tawny princess at his side. Everybody was surprised, and the old man gave the happy couple his blessing. The wedding was appointed for the following Sunday; cards were issued to all the relatives, the prisoners that had been held over were killed and roasted, and everybody was happy.

**BATTLE OF THE WARRIORS.**

## XVII.

### DUNGEONS.

LIFE IN THEM. — ANCIENT DUNGEONS. — THE PRISON OF ST. PAUL. — THE DUCAL PALACE. — “SOTTO PIOMBI.” — THE POZZI. — SHUT UP IN THE DARK CELLS. — A NIGHT OF HORROR. — A GUIDE’S BLUNDER. — DUNGEONS OF ST. PETERSBURG. — PETER THE GREAT TORTURING HIS SON. — A PRINCESS DROWNED IN PRISON.

A GREAT many people have at some time in their lives been in dungeons; some of their own accord, and others much against their wills. Those who have gone there voluntarily rarely stay long, as their visits are made out of curiosity; and curiosity in regard to dungeons is very speedily satisfied. I have been in a fair number of dungeons, but I generally made my way out of them with very little delay. They are not very agreeable places of residence; and if one of them were assigned to me as a spot to dwell in, I should get out at the earliest moment, when it was in my power to do so.

A dungeon is an old-fashioned institution, but it is not altogether out of date. If the history of all the dungeons in the world could be written, there would be many startling tales narrated, and many volumes could be made concerning what has transpired within them.

In the days of the ancient Romans, every emperor of good and respectable standing kept a private dungeon for his own use; and he had a good many public ones lying round loose for his friends to occupy. Some emperors kept their dungeons well stocked at all times, with an assorted lot of humanity. They were not particular as to age or sex, as long as they could have their dungeons liberally patronized. Nero did a fine business in the dungeon line, and successfully rivalled many of his competitors. He displayed great ingenuity in starving

his prisoners, and occasionally in putting them to death ; and so did others of the Roman rulers. Nero was a festive old fraud, and did not mind putting his friends to a good deal of trouble in order to amuse himself. I have elsewhere alluded to his fine array of gridirons, toasting-forks, racks, and thumb-screws with which he used to get up exhibitions of a very select character.

Many of the old dungeons are now closed, partly for want of business, and partly for the reason that their present proprietors have a delicate regard for the reputation of their ancestors, and do not wish any prominence given to these old prisons. Other dungeons are kept open to visitors, but nobody is confined in them. One of the most celebrated dungeons of Rome, for instance, is that in which St. Paul was involuntarily lodged during a part of his stay in Rome. There are two dungeons, one below the other : the upper one is not altogether uncomfortable, though its space is rather restricted, and does not afford much room for exercise.

When I visited this place the guide pointed out several of its peculiar features : one of them is an impression of a human face in the solid rock, at the side of the staircase ; and he related, with great solemnity, that while St. Paul was being led down the stairs his keeper pushed him, and pressed his face against the stone. An ordinary face, he explained, would have been injured by the operation, but a miracle was performed, in the instantaneous softening of the rock, so as to receive the visage of the apostle without injury. The impression thus made remains to this day.

Another curious feature is the spring of water from which St. Paul baptized one of his jailers. It is related that one of the jailers became converted, and desired Paul to baptize him. No water was at hand for the purpose ; but a miracle was performed, by the opening of the rock in the floor of the dungeon and the appearance of a spring of water. This spring remains at this day, and contains water apparently fresh and sweet. The keeper of the place dipped a quantity of the water from the spring, and offered it to our party for drinking.

We were about to drink, when the guide who accompanied us shook his head, and intimated that the liquid was not good. We did not taste it; and therefore I cannot speak positively as to its character. A picture has been painted, and is preserved in the room above, showing the miraculous opening of the floor, the water rising like a fountain from the rock, and the apostle engaged in the act of baptizing the jailer, who is kneeling before him.

In the middle ages every owner of a feudal castle had a dungeon about his premises, though it was not always under ground. Sometimes it was hewn out of the solid rock which formed the foundation of the edifice, and sometimes it was in a high tower placed at one corner, where the occupant could look out and enjoy the scenery, though he was debarred from any practical knowledge of it other than what he could obtain through his eyes. Many a person has lived and suffered for years, shut up in a high tower where he could look out on the world around him with the consciousness that he was never more to enjoy his liberty.

The Ducal Palace of Venice was well provided in the dungeon line. There were prisons under the roof of the palace which were known amongst the Italians as the "Sotto Piombi," or "Under the Leads." They were so named from their position, directly under the roof. They were hot as ovens in summer, and as cold as refrigerators in winter, and they were connected with the room where the famous Council of Ten used to sit. From these prisons persons accused of crimes against the republic were taken before the Council, whose members sat with their faces covered with masks, and their bodies wrapped in cloaks and mantles, so that it was utterly impossible to identify them. To be dragged before the Council was equivalent to a sentence of death; and generally the trial of an offender would be very brief.

Any one could make an accusation against a person, who would be speedily arrested and taken to trial. He never knew who were his accusers; and very often he did not know what testimony was to be given against him.

From the Council Chamber he was generally taken to execution, though not always ; in either case he was led across the famous Ponte di Sospiri, or Bridge of Sighs ; and according to tradition the bridge received its name because prisoners, weeping and sighing, were led across it for execution, or were taken from the prison for trial before the Council of Ten.

Byron has written, —

“I stood in Venice by the Bridge of Sighs,  
A palace and a prison on either hand.”

Between the Ducal Palace and the prison proper of Venice there is a narrow canal. The bridge is elevated far above the water, and has two passages, each about four feet in width. In regard to these passages traditions differ : one tradition is, that the two were designed, one for noble prisoners, and one for plebeians, while another says that they were used indifferently, patrician or plebeian being allowed either passage without regard to the rank or position he held. The reader can accept whichever explanation suits him best.

Down beneath the palace was a real dungeon : it could never have been an inviting place, and it is very far from being so at this day. No effort is made to keep it in fine condition : it is not carpeted ; its walls are not painted, neither are they frescoed. I remember on my first visit that, after we had wandered through the palace, our guide descended a series of stairways, and finally brought us to a place below the level of the water which surrounds Venice. “Here,” said he, “are the dungeons ; and here is where many state prisoners, who offended the laws of Venice, passed the portion of their lives immediately preceding their deaths. You can enter them, gentlemen, and see how you would like them.”

Torches were lighted, and we told the guide that we preferred to follow him. On we went, where not a ray of light from the outer world could reach us. Had our torches been extinguished we should have been in darkness as deep as that of the lowest and most elaborate mine in the world. It

did not require a vivid imagination to roll back the centuries, and bring before us the thousands and thousands of men who had lain there, day after day, without hope, until led to trial, and thence to execution. What a world of mystery lies concealed in these prisons! Here is the cell where Marino Faliero was confined; and here is the cell where Jacopo Foscari passed the days preceding his execution; and here is the cell where dozens of men of noble birth and gentle rearing were kept day after day, till they died of starvation and for want of fresh air. The cells are little boxes, some of them not more than six or eight feet square, and not high enough to allow a tall man to stand erect. One cell is only four feet high; and it was said that a healthy man confined in this cell generally died on the sixth day, owing to the dampness and impurity of the air he was compelled to breathe.

To have a practical realization for a few moments of the horrors of imprisonment, we entered one of these cells, and told the guide to take away the torches and not to return for five minutes, whether we called him or not. He went away; the air had been chilly, damp, and disagreeable; and it seemed ten times more so as the light disappeared. The darkness was of the intensest blackness; we could not distinguish anything. With our faces turned towards the door of the cell it seemed the same; the finger held an inch before the eye was no more visible than if it had been cut off and buried a hundred feet deep in the earth.

One minute was quite enough of this sort of thing, and we were inclined to shout for the guide, when we remembered that we had told him to get out of hearing, and not to return even if we called.

I almost expected the ghost of one of the departed occupants to rise before me, and add to the discomfort of the occasion. A ghost is bad enough anywhere; but I always prefer to encounter him above ground, and where there is, at least, enough light to enable me to see him. Had one of those gentlemen made his appearance, it would have been necessary for him to bring a lantern, or rub his unearthly limbs with phosphorus, to enable us to see him.

But no ghost made his appearance, possibly for the reason that the body in the flesh had had quite enough of that place, and had no wish to send his shadow back again. The five minutes' absence of the guide seemed at least an hour, and when he returned we welcomed him with all the enthusiasm with which we would have welcomed a brother from whom we had been separated a dozen years. We told him that we thought he had been away much longer than the time stipulated, but he assured us he had not.

On narrating this incident afterwards to a party of gentlemen in Paris, I was told of a similar experience, only a great deal more so, of a couple of travellers, one an Englishman and the other an American, who tried the experiment which we did. It seems that the men wished for a little taste of imprisonment, and sent away their guide for half an hour.

It happened to be near the close of the day. Their guide was a stupid fellow, and thought he would improve his thirty minutes by retiring to a *Trattoria* to indulge in a bottle of cheap wine. So he came out of the palace and crossed the Piazzetta San Marco to a restaurant near the corner of the piazza. He took his wine, indulged himself for about twenty minutes, and then started on his return. He had not observed the hour of his departure from the palace, and when he returned to the entrance he found it closed. It was the time for closing, and the persons in charge of the premises had shut the doors and gone away.

Here was a predicament. He had left the two gentlemen down in the dungeon in total darkness, where he could not reach them, and where their shouts could not be heard. He tried to obtain an entrance to the palace, and to explain the matter, but the porters were obstinate, and did not believe his story. Italians are very suspicious, and the custodian of the palace suspected that he wished to get inside in order to steal something; so they turned him away, and he walked off sorrowing.

It was during the time Venice was under the rule of Austria. The Austrian officers were never inclined to show

any favors to the Italians, and consequently the appeals of the guide to those in charge of the city were of no avail. So, finally, with Italian resignation to what could not be very well helped, he went home, wrapped himself in the bosom of his family, and slept the sleep of the innocent and conscientious.

Meantime the two travellers were having a good time of it down below. They stood it for a while very well, but the half hour appeared to them three or four times what it really was. Very soon the thing ceased to be a joke. They were well aware that the time might seem long to them, but they thought it was stretching itself out altogether too much for comfort. They were in a cell where they could not walk around, and where there was no chance to kill time by turning summersaults or playing leap-frog. They stood a while and talked; then they stood a while and swore; and then they had another period of standing still and shouting. The facilities for standing still were unlimited, but those for doing anything else were very much restricted.

They shouted themselves hoarse, and obtained no response. The result of their swearing was pretty nearly the same. They began to grow hungry and thirsty, but there was nothing to eat, and there were no materials at hand for quenching their thirst. The half hour extended to an hour, and then to two hours, and then they concluded to sit down and wait for the fellow to come back. They had no means of knowing how time was passing, as their watches were not of that peculiar kind that strikes the hours, and tells you how you are getting along.

They listened and listened, and finally they heard sounds; but they were not welcome ones, as they were caused by the rats that ran about the place. The rats seemed to have a fondness for the dungeon. They did not make much noise, and could only be heard when the strangers were perfectly still; but there they were in goodly numbers, and their presence was not consoling to the travellers.

From hungry and thirsty they began to grow sleepy, but the

facilities for sleeping were not good. The furniture of these prisons was never elaborate, even in the days of the glory of Venice. The rulers of that city never thought of providing their prisons with upholstered sofas, and four-post bedsteads. The furniture generally consisted of a bundle or two of straw, and possibly a chain. Sometimes a stool was added, but it was a luxury which every prisoner did not possess. There was neither straw nor sofa in the cell at the time these unhappy travellers were shut up there, and consequently, if they wished to sleep, they must lie down on the bare floor of stone and hard earth, at the risk of taking cold and spoiling their store clothes.

They compromised the matter by sitting down in the corners and taking occasional winks of sleep. Their slumbers were not of long duration, and were interrupted by the rats running over them, and making themselves remarkably free, considering that they had never been introduced.

Hour after hour passed away. One of the men said, "it seemed as if we were shut up a full month; and," said he, "I suppose if I had been alone it would have seemed to me about six months."

Finally, in the morning, as soon as the palace was opened, the guide returned with his torches, and rescued the prisoners from their confinement. He tried to make them believe that he had only been gone about half an hour, and he almost convinced them of the truth of his averment, by proceeding to show them, in a very mechanical way, the other curiosities of the place, and to tell them it would soon be sunset, when he would go home and prepare to show them the way to the theatre in the evening. He told them, "I suppose, gentlemen, it seemed to you as if you were there a good many hours. It always seem so to gentlemen; they say so always."

The travellers admitted that it did seem as if they had been there a good many hours; and as they came up stairs, saw the sun rising, and saw the movements of the people indicating that it was morning, they perceived how they had been

treated. Without heeding the request of the guide to be paid for his trouble, they kicked him from the door of the Ducal Palace half away across the piazzetta, and left him to go home without any fee for his day's services, and with the impression of an English and an American boot painfully evident on his person.

On the banks of the Neva, in St. Petersburg, there are some famous dungeons in which prisoners of state have been confined. Peter the Great ordered one of his sons imprisoned there, and treated him with great severity. Peter was a hard-hearted monarch, and with his love for Russia, he was as ready to visit punishment upon the members of his own family as upon any one else. The Empress Catharine is also said to have shut up some of her relatives in these prisons; but her cruelty never quite came up to that of Peter, who is said to have caused his son to be put to torture in his own presence, and to have stood calmly by and witnessed his dying agonies. But then she was a woman, and a good deal must be allowed to her in the way of womanly feelings.

A pleasant feature of these dungeons at St. Petersburg is that they are located under the level of the river. St. Petersburg was built originally on a marsh. There is not a hill in the whole city, and the level of the street is only a few feet above the banks of the Neva at high-water mark. Once or twice in a century, the city is inundated, and in such cases the prisoners in these underground cells are quietly drowned; at any rate, such has been their fate on two or three occasions. It is true they might have been saved, had the officers in charge of the prison been willing to open the doors, and allow them to leave their cells; but no one thought of an inundation, and as the prison-keepers had strict orders to keep the prisoners in their cells, unless otherwise commanded by their superiors, and as the superiors were away at the time of the flood, the poor victims were drowned like rats in cages.

There is a thrilling story about one of these dungeons, or rather about one of the prisoners confined there.

A Russian adventuress, said to be a princess, of great

beauty and accomplishments, about the year 1822, was in the south of Europe, and claimed a relationship to the emperor's family. Some persons at this day insist that her claim was well founded, while others say that it was purely fictitious. At any rate she made a great stir, and created so much trouble to the emperor and the Russian government, that an attempt was made to bring her back to the empire, where she could be properly dealt with.

Various traps were set, and various plans were laid, but none of them were successful, until one day — I think it was at Genoa or Leghorn — she was invited to visit some ships lying at anchor in the harbor. A party had been made up, and every one, including the princess, whose name I do not now recall, had partaken liberally of champagne.

A Russian officer in civilian dress was of the party, and adroitly managed to induce her to go on board a Russian ship of war then in the harbor. The instant she touched the deck the anchor was lifted, and she was invited below. The rest of the party were put ashore, and the ship sailed for Cronstadt.

She was kept in close confinement during the voyage, and on her arrival at St. Petersburg was consigned to one of the dungeons. There she was kept a close prisoner in the hands of the government to which she owed allegiance, and which she had deeply offended. While she was still in this dungeon there came the great inundation of 1824. The prison where she was kept was flooded, and the unhappy princess was drowned.

I heard the story of her unhappy fate while in St. Petersburg, and afterwards in Paris. It was recalled to me in the latter city by a painting in the Russian department of the great Exposition of 1867. The most attractive picture in the Russian collection was the one which represented her death. It was not a large picture, but fearfully realistic in its character.

It showed the interior of her cell, and the torrent of water flowing in through a small grated window near its roof. It

was pouring in like a miniature cascade. It had covered the floor up to the very edge of the rude pallet which formed her bed. Its sheep-skin covering was hanging over its edge ; rats by the dozen were climbing up this coverlet and crouching around the unhappy woman, who knelt on the couch, her hands clasped, and her face turned upward. There was a dim light in the cell, just enough to render the scene as gloomy as possible. The attitude and features indicated agony and despair at the nearness of a horrible death, from which there was little hope of relief.

### UNDERGROUND IN SAN FRANCISCO.

CHINESE OPIUM DENS. — PISCO. — EXPERIMENTS IN LIQUORS. — SATURDAY NIGHT AMONG THE CHINESE. — COCOMONGO. — MURDERER'S ALLEY. — CHINESE MUSIC. — THE THEATRE. — BETEL AND ITS USE. — THE BARBARY COAST. — CHEAP LODGING-HOUSES. — A DYING VICTIM. — A DEN OF THIEVES. — "THE SHRIMP." — UNDER THE STREET. — A REPULSIVE SPECTACLE. — OPIUM SMOKING. — ITS EFFECTS. — SAMSHOO. — ITS PREPARATION AND QUALITIES. — INTRODUCTION TO AN OPIUM DEN. — THE OCCUPANTS. — EXPERIMENT ON A SMOKER. — HOW TO SMOKE. — TRYING THE DRUG. — MESCAL. — GOING HOME. — TRYING A SEWER. — A COUNTRYMAN'S DRINK.

UNDERGROUND life, of a peculiar and picturesque character, can be seen in San Francisco, in the parts of the city where the Chinese most do congregate. Soon after my arrival there, two of my friends, whom I will call the Doctor and the Colonel, invited me to a nocturnal visit to the Celestials. I accepted with alacrity, and, dressed in my poorest and oldest clothes, met my friends at the appointed hour in the *Alta* office. Macrellish and Woodward gave us their benediction, and we set out on our journey.

"The best thing we can do," said the doctor, "is to lay in a stock of some powerful disinfectant, or neutralizer, before we start; the stench in some of those underground China kennels is something frightful." I suggested carbolic acid. "Not strong enough!" said the doctor, shaking his head, doubtfully. The colonel forced two long streams of smoke from his cigarito through his nostrils, stroked his long mustache thoughtfully, and suggested, —

"Pisco?"

"What is Pisco?" I demanded.

"That settles it, my friend; you have a new experience before you, and we will fall back on Pisco!" said the colonel.

(250)

**DRINKING PISCO IN A SAN FRANCISCO SALOON.**

"You will be in luck if you don't fall back on the sidewalk after you have drank it!" growled the doctor.

The colonel took my arm, and as we went down towards Montgomery Street, proceeded, in a confidential manner, to enlighten me on the subject of Pisco. It is really pure, unadulterated brandy, distilled in Peru, from the grape known as Italia, or La Rosa del Peru, and takes its name from the port of Pisco in which it is shipped. It is perfectly colorless, quite fragrant, very seductive, terribly strong, and has a flavor somewhat resembling that of Scotch whiskey, but much more delicate, with a marked fruity taste. It comes in earthen jars, broad at the top, and tapering down to a point, holding about five gallons each. We had some hot, with a bit of lemon and a dash of nutmeg in it, at a marble-paved and splendidly-decorated saloon, near the corner of California and Montgomery Streets. The first glass satisfied me that San Francisco was, and is, a nice place to visit, and that the doctor and the colonel were good fellows to travel with. The second glass was sufficient, and I felt that I could face small-pox, all the fevers known to the faculty, and the Asiatic Cholera, combined, if need be.

The colonel rolled me a cigarito, and insisted on my smoking it. I did my best, choked myself with the fine tobacco, let the paper wrapper unroll, burned my fingers, and failed ignominiously. I was glad to see that, while he pitied me, he did not wholly despise me. These Californians have an appreciably large share of liberality in their composition, and will pardon your ignorance on almost any given specialty of their state, provided you don't claim that you have something very nearly as good "at the East." That assumption they cannot, and will not, tolerate on the part of anybody, and I don't so much blame them, after all.

It was Saturday evening, and the streets were crowded, Montgomery and Kearney Streets swarming, as you may say, with people, well dressed, sociable, orderly, and satisfied with themselves and the rest of mankind. Suddenly the colonel remembered that the wine called Cocomongo, from the vine-

yard of that name, near San Bernardino, Southern California, was one of the specialties of a saloon which we were passing at the moment, and we went in and had some.

It was a warm, fruity wine, of a dark-amber hue, very strong, and withal palatable, which I did not find to be the case with *all* the California wines that I tasted. We went up Washington Street to Murderer's Alley, and turned down it, towards Jackson Street. "There is where the French woman was murdered in the night, within ten feet of where hundreds of people were coming and going all the time; and her murderer, after robbing the place, coolly washed his hands and face of the blood, and walked away. He was never discovered. Here, right where we stand, is where the Chinaman cut his runaway mistress open with a sword. I saw him hanged for it. And there is where the police shot—" I thanked my kind friend for this cheerful information, but suggested that it might be well to keep a little of it back for another time. It was not well to exhaust all the pleasant things of life at one sitting. The subject was obligingly changed.

I am satisfied that the name of the alley is well deserved and appropriate. Swarms of Chinese women, with almond eyes, baby faces, painted red and white in the most lavish manner, lips touched with vermilion, hair black and glossy, with a purplish tinge, like the wing of a raven, and clad in blue satin coats and pants, trotted along the alley, their curious wooden-soled, silk and bullion-embroidered shoes rattling like the hoofs of a flock of sheep as they went. Others tapped upon the window panes, to attract our attention as we passed. Before one house we saw "joss-sticks" burning, and the white cloth festooned over the door, and hanging down on either side, told that death was there. We heard the beating of gongs, the squeaking of one-stringed Chinese fiddles, the sharp notes of the kettle-drum and other discordant instruments, making music inside, and, as we passed, a woman, clad in blue and white, threw a bunch of lighted fire-crackers upon the doorstep, where they went off like a running fire of musketry, much to the edification of a gang of little pig-tailed, almond

eyed boys, — “demi-Johns,” I think the doctor called them, — who were gathered around, chattering like so many magpies all the time, in their, to me, uncouth jargon. The Chinese is an ancient language, beyond a doubt; and I don’t see why it has not worn smoother by use in the hundred centuries or more since the “Central Flowery Empire” became “known and feared among the nations.”

On Jackson Street we stopped a few moments in front of the Chinese Theatre, listening to the unearthly din of gongs, which from time to time announced the change of scene, in a never-ending historical drama, and looking about for a special policeman to take us into an opium den. While we stood there, the colonel called our attention to one of the specialties of the fruit stall, at the entrance of the theatre. Among the dozen nameless prepared delicacies calculated to tickle the Celestial palate, and catch the Mongolian eye, was a row of little conical packages, of about one ounce weight each. These were composed of an outer wrapper of some kind of a queer leaf — I could not make out its exact character, but it was apparently that of a tree not native to America — enclosing two or three narrow slices of fresh cocoa-nut, a few thin slices of some fruit or nut resembling in appearance a fresh nutmeg, and about a teaspoonful of a pink-colored paste. A small bowl, filled with this pink paste, stood beside the packages, ready for use, and some of the nuts ready sliced, but not done up in packages, lay near it. The doctor explained that these packages were chewed by the Chinamen as some Caucasians chew tobacco. The chewing produces a lavish flow of saliva, and the chewer has the appearance of having his mouth full of blood, as if from bronchial hemorrhage.

The small nut was the famous “*betel*” (pronounced *be-tel*), and the principal ingredient of the paste was quick-lime. The betel is now raised in California. The colonel said he had always made it a rule to drink the peculiar drinks, and eat the peculiar delicacies, of every country he visited, and he had tried chewing the betel. It only made his gums sore, loosened

his teeth a little, and gave him the heartburn. He could conscientiously recommend it as an experiment eminently worthy to be made by anybody in the interest of science, and thought I should try it by all means. I asked him if he had ever attacked a ready-made sausage in a cheap restaurant. He was forced to admit that his faith in human nature, broad and liberal as it is, had never made him equal to the attempt. I told him that in that case he was only a dabbler in the wide field of science, and until he had entered deeper, he was unfit to give advice to others on the subject.

I declined the prepared betel, lime, cocoa-nut and leaf, but took a bit of the sliced betel plain, and chewed it. It had a slightly astringent effect on the mouth, and though without any very strongly perceptible flavor, soon produced a slight choking sensation in the throat, and a rather strongly marked palpitation of the heart. I don't think I like betel. It is evidently an "acquired taste," as the Englishman remarked about wild turkey, when a party of western practical jokers played off buzzard on him for the noblest bird of the American forest.

They said that the officers had all gone over upon the "Barbary Coast" — another of San Francisco specialties — as there had been a shooting scrape over there. We went on through Dupont Street, to that part of Pacific Street known as the Barbary Coast. The locality is the favorite resort of the dregs of the population of the Golden City — thieves, robbers, prostitutes, and loafers of the very lowest class, and of every color and nationality represented on the earth, Africa, Asia, all Spanish America, the West Indies, the islands of the Pacific, all Europe and North America, having each contributed its quota to make up the mass of vice, crime, and utter rottenness which surges up and down that horrible "coast." It well deserves its name.

We met the officers coming back with their prisoner, a drunken loafer from Australia, who was making night hideous with his yells as they hustled him along towards the calaboose, followed by a motley crowd, whose aimless curiosity led them to rush along pell-mell in their wake.

One of the specials, whom my companion familiarly addressed as "Shrimp," — probably on account of his elephantine proportions, — consented to come back and pilot us to our destination as soon as the party reached the calaboose. Meantime we went into a Spanish cigar shop, bearing the high-sounding and poetical name "*La Flor de la Mariposa*," literally "The Flower of the Butterfly," and bought some villanous cigars, the colonel and the proprietor becoming involved in an animated dispute in Spanish over the revolt against the Juarez government in Mexico.

Out on the street once more, the colonel wanted us to go through the dens on the "coast." He would take us to the "Bull Run," the "Cock of the Walk," the "Roaring Gimlet," "Hell's Kitchen," and a few similar resorts, and convince me that we had nothing like them in New York. Rather than make the visit, I conceded all he claimed as to the superior and in fact unapproachable depravity of this part of San Francisco; and we retraced our steps to Jackson Street, where, in the heart of the Chinese quarter of the town, we found our officer, and set about the work of investigation, for which we had started out in the early part of the evening.

"Better go down and see how some of these people live, before you go to see how they die," said the officer, leading the way into a dark passage running from the streets into the centre of the block. We stumbled along the passage for some fifty feet or more, and came to a rickety, dirty stairway, which we descended, feeling our way along step by step, until we stood in a court-yard surrounded with high brick buildings on all sides. We could see nothing round us for the moment; but the stench was almost overpowering, and the chattering, which was going on in all directions, convinced us that we were in a locality literally swarming with the lowest class of the Mongolian population. The officer struck a match against the wall, and with it lighted a piece of candle, which he drew from his pocket. Immediately curious faces peeped out at us from behind old gunny-sacks, which took the place of windows and doors in the low basement walls, and a dozen

or two dirty, dilapidated, demoralized looking Celestials came out from different corners, and stood with their hands in their pockets, regarding us with evident suspicion as unauthorized intruders.

"This is a regular den of thieves. Not a single one of these fellows works at any honest trade for a living. They are the bummers and outcasts of Chinadom," said the officer. "Here, Sam Yap, you dirty rascal, have you robbed anybody's hen-roost yet to-night? — I suppose not, though; they don't generally get out at that kind of business until along just before morning, when the streets are almost deserted, and they can move about without much danger of being overhauled and searched. All these fellows are on it, but this one is the worst in the deck. I have had him up at least twenty times, and the next time I am going to vag him. Yes, I am, you bloody old chicken murderer!" said he, holding the candle up to his face that we might all get a good look at him. It must be admitted that it was not a prepossessing face.

He then went to one of the openings in the wall, and pulling back the screen of old bagging, showed us a party of ten or a dozen such fellows gathered around a low table of rough boards, playing dominoes for "copper cash," as the brass coin of China, the value of which is one tenth of a cent of our money, is commonly designated. They stopped a moment, and looked up suspiciously at us, and then at a sign from the officer, whom they appeared to recognize, went on with the game. They played it rapidly, with all sorts of exclamations and facial contortions for accompaniments. The dominoes are the same as ours, but they play the game quite differently. I don't know exactly how it is done, but they seemed to win and lose rapidly. In the centre of the court there was a small brick building, which seemed to be the receptacle of all the filth from the neighborhood. It did not seem to have any connection with the street sewer, or if it had any, it was choked up, for the planking around was literally floating in the foul liquid from it, which oozed up between the cracks at every step as we walked over it, giving off a stench, which,

in any other city of Christendom would breed a pestilence in twenty-four hours.

Behind this, near the opposite wall, we stumbled upon a bundle of filthy rags, which turned partially over as the foot of our guide came in contact with it. The officer held down his candle, and on examination we found that within the rags there was a human being, a man in the last stage of consumption, induced, no doubt, by opium smoking. He could not or would not answer our questions, and his glazed vacant eyes showed that death was close at hand to claim him. He was lying on the wet, dirty boards, without even a blanket under him, and had undoubtedly been placed there to die, having no friends, and belonging to neither of the "Six Companies" with which all prosperous or even partially respectable Chinese in California are connected. The officer turned his head over, and called our attention to the fact that his queue had been cut off, which showed that he had been convicted of theft at some time, and was thenceforward debarred from respectable Chinese society, doomed to associate only with the pariahs of his race.

We had seen enough, more than enough, in fact, of this neighborhood, and our guide led us out to the street by the way we came.

The Shrimp said that there was another place just above, on the same street, which he wanted us to visit before we went into a first-class opium house. We went with him to a large four-story building, which appeared to be divided into apartments of the smallest dimensions, in which the Chinese swarmed like bees in a hive. He said that there were over six hundred persons, all of the poorer class, sleeping in this single building every night. In front of the building was a narrow opening in the sidewalk, with a stairway just sufficiently wide to allow one person at a time to descend into the subterranean regions below. Down this he dived like a rat into his hole, calling out to us to follow and look sharp for our heads. The caution was not unnecessary, as I soon found to my cost. At the bottom of the stairs he lighted his candle

again, and passing through a low opening in the wall, showed us the way under the street.

Here, congregated in total darkness, were some twenty of the poorest class of Chinese stowed away for the night. Some were lying on piles of old rags, evidently picked up by the chiffonniers in their daily rounds, and put aside for this purpose, as having no commercial value, and of no use otherwise. Some were lying on rude benches knocked together from pieces of dry goods boxes, and one, who evidently held a higher position than his fellows, probably a man who had at some time drawn a twenty dollar prize in a lottery, or had a run of luck at the game of "Tan," was stowed away in a bunk in a kind of alcove formed by an arch in the wall, before which was hanging an old tattered chintz curtain. He had an old blanket over him, and was doubtless looked upon with envy and hatred as a "bloated aristocrat" by his less fortunate fellow-citizens. We could hear the ceaseless tramp of the crowd on the sidewalk, and from time to time the rattling of the carriage wheels over the rough cobbles above our heads.

The atmosphere was that of a charnel-house, thick with noisome exhalations from the foul and rotting rags, and the fouler persons, of the denizens of this worse than Black Hole of Calcutta. Water dripped from the roof constantly, and the walls were covered with mould and great patches of thick, oozy slime. What a place for a human being to sleep in and die in! In the five minutes we were there our clothes became clammy from the foul moisture. What must be the condition, physical and mental, of that poor wretch stretched in the rags in yonder muddy corner?

"And the wheels go over my head,  
And my bones are shaken with pain,  
For into a shallow grave they are thrust,  
Only a yard beneath the street;  
And the hoofs of the horses beat, beat,  
Beat into my scalp and my brain,  
With never an end to the stream of passing feet.

"O, me! why have they not buried me deep enough?  
Is it kind to have made me a grave so rough,

Me, that was never a quiet sleeper?  
May be still I am but half dead;  
Then I cannot be wholly dumb;  
I will cry to the steps above my head,  
And somebody, surely, some kind heart, will come,  
To bury me, bury me,  
Deeper, ever so little deeper."

I wonder if there was ever a Tennyson of Celestial literature, and if he ever read anything like the above, and recalled it to mind, as he lay cowering and grovelling through the long hours of the dreary night, in the depths of this living tomb!

Out on the street once more, and we lost our guide, who was called off by a loud whistling for aid, from some other officer over on the Barbary Coast. My companions fell in with a Chinese merchant with whom they were acquainted, and we went with him to his store on Dupont Street. He gave us some scalding hot black tea in little China cups, and offered to help us in any way he could. O, yes, of course he was acquainted with the location of many "opium houses;" the Chinese quarter is full of them! Opium smoking is the great curse of China, and four fifths of the Chinese in San Francisco indulge in it to a greater or less extent. Some use it merely as a sedative, and in moderate quantities. Others use it as commonly as American tobacco chewers use the nicotian weed, consuming a dollar and a quarter's worth every day, and being more or less under the influence of it all the time. The poorer class of opium smokers patronize the opium lodging-houses, where they frequently sleep all night, paying fifteen cents for a few grains of prepared opium and a raised couch to lie on, while inhaling the smoke and sleeping off its effects.

Perhaps a quarter of the whole number of opium smokers use it to the extent of producing stupefaction habitually; these are all old smokers. The habit grows upon one steadily, and it soon beomes a terrible tyrant. When once the habit has become fixed upon a man, there is no possibility of its being thrown off. He daily requires more and more of the drug, while his strength slowly fails him; his appetite for ordinary food disappears; he becomes lean and attenuated;

his brain becomes so affected, that it refuses to act unless the stimulant is furnished, and sooner or later consumption sets in, and the victim dies by inches, as it were, sometimes suffering horribly, while at others he is hardly conscious of suffering at all.

The importation of opium into the Pacific states amounts to millions annually, and the great bulk of it is consumed in smoking by the Chinamen. The women never smoke it; are not allowed to visit the opium houses, in fact. The wealthier Chinamen have accommodations for opium smoking in the upper or back rooms of the buildings which they occupy as stores and dwellings, and do not associate with the common herd who patronize the public opium dens. One Chinese friend thought it a very bad thing, this opium smoking, but admitted that he occasionally took a whiff at it himself, when he felt unsettled, and wanted to quiet his nerves for a night's sleep.

While we were talking, the colonel suggested that I was a stranger, and had never tasted "Samshoo." Our merchant friend at once took down a curious looking black bottle,—something like those that Curacao comes in, wound with some kind of straw string from top to bottom, and having a label in white and vermilion, with Chinese characters,—drew the cork, and poured out a quantity of a dark-brown liquor, something like arrack in appearance, into a little china bowl, which he passed to me, assuring me that it was a very superior article, and pressing me to drink it.

I tasted it, and found it not very strong, but with a curious flavor, something between old Madeira wine and bottled ale, with a marked unpleasant smell, as of decaying vegetable matter. What is it made from? "Licey!" was his prompt response. The doctor explained that it was distilled from rice—mainly the cold rice and refuse from the restaurants, he said—flavored and colored with dried peas, or some similar fruit, and strengthened and enriched with a fine old nutty taste by the addition of a piece of fat roasted pork before bottling. The Chinese consider this a great luxury, and have their private stocks of it, which they regard with as

much pride as is felt by a fine old English gentleman for his cellar of "old crusted port; vintage of 1803." A little of it satisfied me. I think the taste for it must be an acquired one.

Some months afterwards I drank some samshoo, in Northern China, that was far worse than that furnished to me in San Francisco. It was served hot, in small glasses about as large as a thimble. It burned like nitric acid; and I half believed that I had swallowed a torch-light procession with all its lamps trimmed and blazing. I was dining with a Chinese official, and the etiquette of the occasion required me to swallow the vile stuff. By the time I had disposed of a gill or so, my head felt like the paddle-box of a steamer, and my throat was as raw as a freshly cut beefsteak. No more samshoo for me, if you please.

Our new-found friend gave us a card, on which he wrote some characters in Chinese by way of an introduction, and pointed out the entrance to an opium house on the other side of the street. We went over and found the establishment located on the second story adjoining a Chinese restaurant. The proprietor of the house, or "gentlemanly clerk," looked at our card, and at once offered us the hospitalities of the place.

It was, of course, a very poor place, but he would do the best he could for us. There were half a dozen small rooms on the one floor, divided by rough partitions. We entered one of them, and found three raised platforms or beds, with bamboo framework; and in place of our usual mattress, a flat surface of braided cane, like one of our cane-seated chairs, on which to sleep. This is the usual bed of the Chinaman. He does not fancy spring mattresses, curled hair, or feathers to repose upon, and instead of stripping himself and crawling under a pile of woollen blankets, as we do, he lies down in his ordinary clothing, and rarely has anything else over him, unless it is a single blanket when the weather is unusually cool, or the room is open and subject to drafts. He does not destroy his lustrous black hair by burying his head in a hot feather or curled hair pillow, as we do, but has a block of wood or a cylindrical pillow, of braided cane open at

both ends for ventilation, which he places just under the top of his neck. This keeps him from becoming bald-headed, and is uncomfortable enough to make him an early riser ; but like all other systems, it has its disadvantages. In time it throws his neck out of line, giving it a permanent forward bend, not graceful in itself, and rather unpleasant for an outside barbarian to look upon. When he travels he usually carries his favorite pillow with him, and at his death his head rests upon it in his coffin.

Two of the beds in this room were occupied when we came in, the other was vacant. On one a Chinese was stretched at full length upon his back, in utter unconsciousness ; his eyes were wide open, but apparently receiving no impression from the objects before them, and there was a vacant, meaningless smile upon his sallow countenance. His opium pipe or stick lay on the couch beside him, having fallen from his hand, and near his head stood the small, nut-oil lamp, with a glass cover like an inverted tumbler with a hole in the bottom, the tiny taper burning low in the socket.

The other Chinese, who was well dressed, and probably a merchant or manufacturer of the second class, was just preparing to indulge in his nightly dissipation. He did not appear to relish our intrusion, but said nothing, and went on with his smoking. Each guest who pays his fifteen cents receives from the clerk in attendance a small oyster or clam shell, on which there is a little dab of prepared opium, in a semi-fluid condition, resembling, in appearance, thick treacle or partially dissolved "stick licorice," such as we used to buy with our odd pennies at the grocery store at the corner, in the happy days of youth, when we had a terrible cold, and obtained permission to remain at home from school and indulge in the luxury of medicine of our own choice. A slender bamboo stick about three feet in length, hollow down nearly to the largest end, where a little tunnel-shaped brass bowl is inserted, which is the usual opium pipe, a bit of wire about a foot in length, and a nut-oil lamp such as I have described, are also given him, and his "outfit" is complete.

The man who was about to indulge in the luxury stretched himself at full length on the couch, turned on his left side, placed the end of the wire in the opium, twirled it around so as to take up a mass about the size of an ordinary garden pea, formed the mass with his finger into a ball, held the end of the bamboo pipe to his mouth, placed the brass bowl at the other end against the flame of the lamp, slipped the ball of opium off the wire dexterously into the bowl, and as it burned he inhaled the smoke slowly into his lungs, allowing it to escape in little jets at long intervals from his nostrils.

By the time he had taken the third or fourth whiff he was evidently affected. His eyes began to grow dull, his breathing was slow and heavy, and his grasp on the pipe relaxed little by little. In two or three minutes his muscles appeared to relax, his head fell back, and he was in a condition half sleep, half stupor. The doctor explained that the effect of this first smoke would wear off in half an hour or so, when the man would repeat the dose once or twice, and finally become wholly insensible for several hours. We spoke to him, but he did not answer, and it was hard to tell whether he was really unconscious of our presence or merely indifferent to it. It is asserted that the opium smoker sees nothing of what is going on around him, but revels in the most blissful creations of the imagination, his soul sailing away, as it were, from the dull and common-place surroundings of his body, to walk hand in hand with the "black-eyed girls in green" through the fair gardens, among the palm groves, by the banks of the rivers of Paradise. I said as much: the colonel characteristically denounced this practical version of the matter as "all blamed stuff, rot, and humbug. It makes them drunk, just simply blind, stupid drunk, and nothing else!" He had tried it and knew. The doctor said one dose would not produce any serious effects, and against my better judgment I permitted them to persuade me into making the experiment.

The landlord started off to bring my allowance of opium, lamp, pipe, etc., and the colonel improved the opportunity to illustrate his theory that the opium smoker is not absolutely

insensible to pain, like the patient who inhales chloroform, but simply too drunk to resent the imposition which produces it. Tearing off a little slip of cane from the edge of one of the couches, he went up to the wholly insensible customer on the couch, and inserting it in his nostril twirled it swiftly around. A sharp sneeze and a convulsive winking of the dull eyes followed, but no other movement was made by the sleeper. "There, you see now that I am right! If he had taken chloroform he would not even sneeze; his nerves would be utterly incapable of receiving a sensation."

Turning to the other customer, who now lay like a log on his couch, he drew his penknife, opened it, then, changing his mind, put it back, and taking a pin from his vest, inserted it quickly in the calf of his victim's leg. The other leg, which was hanging half over the side of the couch, straightened out with a quick, convulsive movement, and the toe of the heavy felt and wooden-soled shoe on the foot came in contact with the colonel's shin with a vicious energy, which sent him dancing back to the doorway with a remark which did not sound like a blessing, just as the proprietor came in with the opium and its accessories. "Why the —— don't you make your customers take their boots off when they go to bed?" the colonel demanded savagely of the smiling and obsequious master of the house, as he rubbed his shin and cast a glance of hatred at the recumbent form of the lodger who had proved such a poor subject for experiments. "Me no shabbee!" was the non-committal reply.

I lay down on the bed and placed myself in the orthodox position, the doctor resting himself at my head, and the colonel rolling a cigarito and settling down on the edge of the couch at my feet. The host prepared the opium, placed it in the pipe, presented the end of the stick to my lips, and told me, after his own fashion, to pull away. I pulled, and began choking and coughing. The first experiment was a dead failure; the next was more nearly a success, and I felt my head rapidly assuming the dimensions of a sugar-barrel while my body and legs appeared to be shrinking proportion-

ately, all their bulk being drawn up towards and into my head. I felt as I imagine drowning people feel, and gasped convulsively for breath. I could not recognize anything around me for a moment, and then I saw the dark eyes and long mustachios of the colonel coming out of a cloud of smoke and making directly for me at lightning speed, like a hairy comet flying through the air. The idea flashed through my brain that he was about to burn a match under my nose, or commit some similar atrocity by way of an experiment "in the interest of science," and as one struggling in a horrible nightmare I sprang off the bed, staggering around without being able to feel my feet under me, and groping blindly about for something to seize in order to steady myself.

There was a low, dull humming in my ears, a giddiness in my head, and a general sense of faintness and nausea pervading my entire system. "For God's sake, take me out of this!" I cried, at last; and some time after I realized that I was being walked up and down the sidewalk, the doctor and the colonel supporting me on either side. My head was getting clearer, but I felt deadly ill. The faint, sickening odor of the opium fumes clung around me and oppressed me, and I said as much at last, as I leaned heavily against a lamp-post.

The colonel with his usual enthusiasm exclaimed, "O, yes, I see it; you want a good strong stimulant of some kind to help you get rid of it. Now, I know a Mexican over on the corner of Vallejo Street, who has got some double refined *Mescal*, which will dissolve a gun-flint in half an hour; one good drink of that will set you all right."

"Not if I know myself aright!" I remarked, emphatically. "You are the most hospitable people I have ever fallen in with. Your good intentions are unbounded, and your kindness I never can forget, but I don't want any *Mescal* to-night. I have made a sufficient number of new acquaintances for one evening. Pisco, Cocomongo, Betel, Samshoo, and Opium, are all very fine in their way, but the new things are crowding each other a little too fast. We will omit the *Mescal* on this occasion; I want to go home!"

They called a hack, and we rode back to the Occidental in silence. This was my first experience in a San Francisco opium den.

It will also be my last !

Next morning the colonel called on me and said he had forgotten something — an opium den worse than the one we had seen.

"How's that ?" I asked.

"Why," said the colonel, "it is an opium den of a very romantic character. Some years ago the line of Jackson Street was changed by the city authorities, and it became necessary to build new sewers. The old sewer was given up, and in the new arrangements it was under some of the buildings occupied by the Chinese. They took possession of it, and hollowed out galleries on either side. The enterprising proprietors converted it into an opium palace, at the popular admission fee of two cents. The accommodations and odors are a hundred-fold worse than those of the place where we were last night. For two cents you can get smells enough to last you a lifetime. Do you want to go?"

I concluded that I wanted nothing more in the opium line, and declined to go. I may have been too fastidious, but I had not then travelled as much as I have in later years, and novices, you know, are inclined to be particular.

A sewer, whether abandoned or not, has few charms. At St. Louis there are, or were when I was last there, some of the smaller sewers that are so broken at their mouths, near the river's edge, as to present the appearance of natural springs where the water oozes up through the sand. One day a gentleman was standing near one of these sewer mouths, when two countrymen came strolling along the bank, one of them thirty feet ahead of the other. As the foremost of the twain spied the water slowly pouring from the earth, he shouted to his friend,—

"Hullo, Jim ; here's another spring !"

"Well, Gaul darn it," answered the other, "if tain't no better water than the last we found I don't want none of it."

## XIX.

### AMONG THE DETECTIVES.

DETECTIVE LIFE. — CURIOSITIES OF LIFE IN A GREAT CITY. — NOT KNOWING YOUR NEIGHBORS. — PECULIAR ACQUAINTANCES. — ROBBERY OF A DRY GOODS STORE. — INGENIOUS DETECTION OF THE CRIME. — LOVE AND JUSTICE. — A SURPRISING DENOUEMENT.

THERE are some men who seem better fitted to live beneath the surface of the earth than in the open air. Their habits are much like those of the mole or the weasel, and sometimes they are not altogether unlike those animals in general appearance. They have the burrowing propensity of the rat and the woodchuck, and in many instances their lives are about as reputable as that of the first-mentioned animal. They seem to avoid the light of day, and to spend their lives in undermining the works and lives of others. Great cities can furnish a good supply of these men, and the rural districts are not altogether destitute of them. They flourish best in large cities, as there they have a better field for their operations than in the country. In the country everybody knows everybody else for a considerable distance around, and can tell you about his family and its antecedents for as many years as you care to know. Frequently the people observe the manners and habits of their neighbors with more care than they observe their own.

In the city men go about their daily occupations, knowing little and caring little about others, except those with whom they come in contact or have relations of a business character. In New York, for example, there is not one householder in five who knows the name and occupation of his next-door neighbor, and generally he does not care to know. People may occupy the same house for years without knowing anything

about each other. I can give a personal experience of my own which will illustrate what I have here stated.

During the first year of my residence in New York, after remaining a few weeks at a hotel I went one day in search of lodgings in a private house. I found a house whose exterior pleased me, and on the door-post there was the attractive announcement, "Rooms to let." I rang the bell, made known my object, saw the vacant room, was satisfied, and engaged it. Next day I moved in. I took my meals at a hotel, and for a year and a half occupied that room.

I did not know the name of anybody in the house except the proprietor, and never troubled myself about the occupants of the rooms on the floor where I was located. One day, in ascending the stairs, I met an acquaintance coming down; an acquaintance whose business was in the very office where I was located, and whose desk was not far from mine. We hailed each other, and our conversation revealed the fact that he had been for two years an occupant of that house, and I had been there nearly a year. Had we been in the country, or almost anywhere else in America than in New York, we should have known each other's local habitation and names in less than a fortnight.

City life, politics, and poverty are about equal in the opportunities they afford for making acquaintances with peculiar people. These acquaintances may not be formed very rapidly; but as one moves about in a great city, he is certain, sooner or later, without any effort on his own part, to be introduced to men whom he would not always be willing to recognize in public. Without ever going to church he may make the acquaintance of clergymen. Without touching a playing card or entering a gaming house he may be acquainted with gamblers. Without studying the mysteries of the kinchin lay, or familiarizing himself with the language of the inhabitants of Blackwell's Island, or the state penitentiary, he may become acquainted with thieves of various grades. Without doing anything for which he should be "shadowed" he may be familiar with detectives, and without

speculating in stocks he may know the men whose fortunes are made and lost on Wall Street. A great city is an epitome of the globe, and in its streets, and alleys, and by-ways may be found all the vicious and dangerous elements of human existence.

Some years ago it was my fortune to become acquainted with a professional detective. He was not of the elegant sort, whose labors are confined only to the exposure and punishment of crimes of the higher grades, but he was a man who, to use his own language to me one day, was 'ready for anything.' He told me several stories of his experience. He did not present documentary evidence of their authenticity, and some of them were rather too much for my belief. Others were plausible enough to be true, and as the man always appeared to have plenty of money, I concluded that he must be an expert at the business. One evening he told me his experience in working up a case of robbery, which I will endeavor to give as nearly as possible in his own words:—

"A dry goods merchant on Broadway had lost a considerable amount of property at various times, but on no one occasion was there a large quantity taken. Of course the clerks in the establishment were suspected, but there was no way of discovering whether they were guilty or not. A close watch had been set on all of them, but nothing could be discovered. I was engaged to work up the case, and to enable me to do so, I was employed in the store as an extra clerk and salesman. It was thought that the foreman and floor walkers might be guilty of the robbery, and therefore they were not taken into the secret. The head of the house explained, however, to the foreman that I was a relative of his wife, and had been thrown upon him to provide for. It was therefore understood that I was not to be required to work very hard, and was to be allowed to go out whenever I asked permission. With this understanding I went to work at my new business. I did not know anything about dry goods, nor about selling them, and consequently they put me upon the

commonest articles, which were not in very great demand. This gave me plenty of time for looking around and observing the habits of the clerks.

"I became acquainted with one after another, but made no headway for several weeks in discovering the secret. I accompanied the clerks to their rooms occasionally, and sometimes we were at the theatre together. I knew the salaries that were paid in the establishment, and I knew just how much money each man could afford to spend, and my object was to find out what man among them was living beyond his income. All of them appeared to be quiet, well-behaved young men. Some of them were members of the Young Men's Christian Association, and others patronized the Mercantile Library, and spent most of their evenings there. Three or four were a little inclined to fast lives, but evidently did not have money enough to carry out their wishes.

"After a time I found out that one, who was the most quiet and unobtrusive of the whole lot, seemed to be living a little beyond his means. Upon him I fixed my suspicion and watched him closely both in the store and out of it.

"He and I became fast friends. We went about the city together; we visited the theatres and beer-gardens, and on Sundays took a trip to Coney Island, where we occasionally spent several dollars in entertaining ourselves and chance acquaintances; but the young man, whom I will call Johnson, was constantly on his guard, and whenever I proposed any new amusement or any additional expense, he always opposed it, and said that he could not afford it, though somehow he generally did afford it before we got through.

"I found he had a sister living in Harlem. Occasionally, but not often, she called at the store. She rarely bought anything, and never remained longer than a few minutes. He visited her every few days, though sometimes a week or two might intervene between his journeys to the place where she lived. Several times, when he was absent and I knew he was to be away for the evening, I visited his room, and searched it carefully; but never a thing could I find to implicate him in

the robbery. Not a scrap of silk or lace or anything of the sort could ever be discovered in the room.

"I next managed to be introduced to his sister, and of course I pretended a great liking for her. She was living in a very quiet way, in a boarding-house, and was a teacher, on a small salary, in one of the public schools. Having ascertained her salary, and, calculating her expenses, making an estimate of the value of her clothing as nearly as I could, I was satisfied that she was living somewhat beyond her salary.

"One day Johnson told me that he was going with his sister to a school picnic. He had obtained leave of absence from the store, and I thought it an excellent time to make investigations. So I went to his sister's boarding-house, inquired for the young lady, and of course was told that she was away. I explained to the landlady that I had received a message, saying that she would be at home several hours earlier than she had expected, and that I was to meet her that afternoon, to go on another excursion. I said it was about time for her to reach home, and, if the landlady had no objection, I would wait in the parlor. As I had been there frequently, and the landlady knew me, she made no objection. Luckily she went out a few minutes after, and gave me more freedom to operate than I had expected.

"I immediately went to the young lady's room, — of course it was very impolite for me to do so, — and searched it thoroughly. It is of no use telling you all I found there, unless you have never been in a lady's room, and do not know what it contains. She had a very good wardrobe, better than most young women in her position. It struck me as very odd that she had four dresses of rich black silk, which did not appear to have been made a very great while. Four dresses of black silk are a pretty good supply for a school teacher on a small salary, and I made up my mind that the silk came from the dry goods store where Johnson was engaged.

"There is a great difference between believing a thing and proving it. You may be certain of it from the circumstances, but it may not be very easy for you to go into court and show

its reality. Now, here was my predicament. I thought four dresses were too many for one young lady, just as I once thought, when I searched a man's trunk, and found fourteen coats of different sizes, and no trousers or vests, that it was a remarkable wardrobe for a gentleman to have. But how was I to get at the fact, and show the connection between the wearing apparel of Miss Johnson and the Broadway dry goods store?

"To help matters along, I made love to Miss Johnson in the regular way, referred to my relations with the dry goods house, and obtained an indorsement from the head of the firm, as a relative of his wife. I was getting along very well, only I did not want to propose and get an engagement, because that might make the situation a little awkward. I deferred the day of proposal on the ground that my uncle in the country, from whom I had expectations, was opposed to my marriage, except to a lady of his choosing; and that I should be obliged to wait until he had handed in his cheeks, which would be before a great while, as he had a lovely cough, and the rheumatism, supplemented with the dyspepsia and gout, so that the situation was perfectly charming.

"Johnson approved of my attentions to his sister, and of course we became warmer friends than ever. All this time I was studying to entrap the two, so as to fasten the robbery of the dry goods house upon them. One day I pretended a great admiration for a certain kind of silk that I had seen at the store. I told Laura that it suited her complexion exactly, and was just the dress she ought to wear. It was a light-colored silk, of a peculiar shade, which had been made expressly to order for the dry goods house, and I knew that they had the monopoly of it. I spoke about it several times, and said I hoped, one of these days, to be able to present her with a dress of this sort, but did not know when it would be, as my income, just at that time, was too small for any lavish expense.

"Love for me made the girl incautious. Four or five days later, twenty or thirty yards of this silk were missing from the store; and in a week or more, when I made a call, Laura

surprised me with a dress of the material I had so much admired. I praised it, and I praised her, and she was happy.

"I invited her to accompany me the following evening to a theatre, and told her she must wear that dress; that I wanted her to be the prettiest and best dressed woman there; and, dressed in that, I knew she would be. We went to the theatre, and afterwards to Delmonico's, where I had arranged to be shown to a private room for supper. I had invited her brother to join us, and, to avoid his suspecting anything, I told him that the day before, I had received a remittance of fifty dollars from my uncle, and was going to have a pleasant evening, without regard to the expense.

"But her brother was not the only person to be there that evening. The head of the firm was waiting where he could see us enter, and with him was a policeman.

"Our supper was brought, and was progressing finely; we had each taken a glass of champagne, and possibly two glasses, and, as the servant came into the room bringing something I had ordered, he was followed by the head of the firm and the man in blue. Johnson was arrested for theft, and his sister for being an accessory to the theft. Both turned pale; the young lady fainted, so that we had to dash water in her face—seriously injuring the elegant dress she wore. Johnson stoutly denied his guilt. He was taken from the room before his sister recovered. When she came to her senses, we told a pardonable falsehood, and said that he had confessed everything. She supposed our statement true, and then acknowledged that she had first urged her brother to the commission of the theft, in order to gratify her love for finery. With an eye to economy, she had always induced him, when stealing on her account, to take enough to pay for making up the material, so that she would not be subject to any expense at the dress-maker's.

"Johnson maintained his innocence until his sister told him that she had made a confession. Then he acknowledged his guilt, and explained how the robberies had been carried on.

"He had managed to ingratiate himself with the porter who

swept out the place after the day's work was over. During the day he would fold the silk he intended to steal into a bundle that might resemble a lot of waste paper, watch his chance, and throw it in a place just large enough to receive it, under a shelf, a few inches above the floor. When the porter swept the store, he brought out the package with his broom, taking care to have a sufficient quantity of waste paper and rubbish lying near to prevent attracting attention to the package. In this way he would get it outside, and take it to his home, where Johnson would call for it. The porter received something for his efforts in the cause of dishonesty, and the stolen property would be taken to Laura's house, whence it would go either to the dress-maker or to a receiver of stolen goods.

"The porter was arrested an hour later, and both he and Johnson received the punishment due to them for their crime. As for the girl who was the cause of the theft, she was allowed to escape, on condition of leaving the city immediately. The firm would have prosecuted her, had it not been for my intercession. I liked the girl, and was ashamed of the trick I had played upon her; but then, you know, it was in the interest of justice, and a man ought to be willing to do anything for the sake of honesty.

"It is a little off color to make love to a girl, and pretend you want to marry her, just for the sake of entrapping her into the disclosure of a crime; but this is the way of the world, and anybody who thinks differently does not know the whole duty of the detective. Why, I have been to a fellow whom I suspected, and told him that his wife and children had been killed by a railway accident, and got him worked up to a terrible condition of anguish. I did it just to throw him off his guard, make him a little crazy perhaps, and then, while he did not know what he was about, I would accuse him of a crime, and get him to own up.

"If a man is going to be a good detective, he must not go frescoing around with anything like fine feelings. If he does not go in for all the tricks of the business, he is not likely to succeed in his profession."

## XX.

### THE EARLIEST EXCAVATIONS.

GRAVES AND THEIR CONSTRUCTION. — DIFFERENT MODES OF BURIAL. — TOMBS. — THE MOST EXTENSIVE TOMBS. — OBJECT OF THE PYRAMIDS OF EGYPT. — A VISIT TO THE GREAT PYRAMID AND ITS DESCRIPTION. — DIFFICULTIES OF CLIMBING. — THE TOMBS OF THEBES. — A FAT AMERICAN'S ADVENTURE. — ENTERING THE TOMB OF ASSASSEEF. — RECITING POETRY UNDER DISADVANTAGES. — SWALLOWING A BAT. — JACK'S DISGUST. — FATE OF A FAT MAN. — STUCK IN A PASSAGE-WAY. — HOW THE ARABS REMOVED HIM.

THERE is little or no reason to doubt that the earliest excavations ever made by human hands were for purposes of sepulture. The burial of the dead, or rather the disposition of their bodies, has been a necessity in all countries and all ages since the days of the Garden of Eden. Some nations have practised cremation, and there are many arguments in its favor; but with most of these nations it was the custom to gather the ashes of the dead into urns, which were buried with much formality. Among some of our western tribes of Indians the bodies of the dead are placed on scaffoldings of poles several feet high, and there left to the action of the elements. This practice had its origin in the absence of all tools suitable for digging in the earth, and possibly from a vague theory that the body of the deceased should be raised towards the home of the Great Spirit beyond the skies. Some of the ancient nations had a theory concerning cremation, which was, that the flame, rising towards heaven, carried the spirit of the deceased and enabled it to reach the mansions of the blest. On the same theory the Chinese write or print their prayers on paper, and then burn the paper; the flame carries the prayer upward, and as light and heat come from

the Controller of the universe, they are considered the proper vehicles for the transmission of appeals to his mercy, his pity, and his infinite love.

The earliest form of sepulture was in the grave, a simple trench a few feet in depth. With the dawn of civilization came the tomb, rudely constructed of stones piled together, or cut out of the solid rock. The most elaborate specimens of the latter kind of tomb are in Egypt; thousands of years ago they were constructed, and to this day they remain, and are regarded with wonder by travellers from all the nations of the globe. The most extensive tombs of modern times bear no comparison to those which are found in the lands bordering on the Nile. The pyramids of Ghizeh, immense mounds of stone, and constructed with the greatest care and engineering skill, are the tombs of the rulers of Egypt in the days of her greatness and prosperity. The pyramid of Cheops rises to a height of nearly five hundred feet, and is of proportional width at its base. Down deep in its centre is the coffin of the man whose name has been given to the pyramid; thousands of years have passed since this huge tomb was constructed, and it will doubtless remain for thousands of years to come. No tomb of modern times approaches it in grandeur, or gives promise of outlasting it.

Though the opposite of underground in their character, and erected rather in the interest of death than in that of life, the great pyramids deserve a description here. Excavations were made for their foundations, and the interior chambers, where rest the coffins of those for whom they were erected, are, for all practical purposes, as much underground as they would be in the deepest coal mine of England or America. The pyramids are mostly on the west bank of the Nile, not far from Cairo; tourists designing to visit them make Cairo their starting-point, and from that city several groups are in full view. Altogether about seventy pyramids have been counted in this region, and the remains of many others are visible. Decay's effacing fingers are constantly at work; forty centuries have passed since the pyramids were erected,

AUSTRALIAN NATIVES BURNING THEIR DEAD.

AN INDIAN BURIAL PLACE.

and their durable character can be readily inferred when we remember how long they have stood.

A sepulchral chamber was first excavated in the rock, and during the life of the king who was to repose within it, the work of building the pyramid was pressed forward. It was generally completed before he died, and therefore he had the consolation of knowing that he would not be kept waiting around for his tomb to be constructed. The structure was made over this chamber, an elegant coffin of stone being first placed within it. A passage-way about four feet high and three feet wide was kept open, so that the body of the king could be carried to the sepulchral chamber when the proper time arrived for depositing it in its coffin. The pyramid was practically solid, as the chamber and passages leading to it were the only hollow spaces. The sides of the pyramids were directed to the four cardinal points of the compass, and their exactness in this particular leads to the supposition that the ancients were acquainted with the principles of surveying as practised by modern engineers.

The pyramids were constructed of red granite from quarries at Assouan, and other points of the Nile, and of a hard limestone from quarries at Makotam and Tourah. The blocks were very large, and it must have required a vast amount of mechanical power and engineering skill to quarry them and move them to the places where they are now found. Many engineers think that the Egyptians must have possessed some mechanical power which has been lost and become unknown to the people of the present century. Especially is this the case with the huge stones at the top of the pyramids, where the number of persons who could work must have been very small for want of room. Other engineers say that the ordinary derrick on a large scale would have been sufficient for the purpose, and it is pretty certain that this instrument was used, as holes have been found in the stones, where it is supposed the feet of the derricks were placed. Others think that the blocks were moved by human power, of which the kings had an unlimited quantity at their command. One

theory is, that as fast as the courses of stone in a pyramid were laid, the earth was piled around it so as to form an incline, where the blocks could be slowly rolled. When the last course, at the top, was laid, the pyramid would have the appearance of a hill with gradually sloping sides. The earth could then be removed, and when it was all carried away the pyramid would stand as it was intended to stand. It is true that this mode of work would require an immense force of men; but what did the kings of Egypt care for the toil of their subjects? The kings owned the land and the people, and could do as they pleased with either.

The pyramid of Cheops, known as the Great Pyramid, was twenty years in building, and it is said by Herodotus to have required the labor of a hundred thousand men during that time. Cheops stopped all other works connected with religious rites until the pyramid was completed. To facilitate the transportation of stone from the Tourah quarries, a causeway was built three thousand feet long, sixty feet wide, and fifty feet high, which is said to have required ten years for its completion. A railway engineer of the present day would have finished this causeway in a month, provided he could have the unlimited supply of laborers possessed by the Egyptian kings.

The Great Pyramid covers an area of between twelve and thirteen acres; the side of its square measures seven hundred and forty-six feet, and its height is four hundred and fifty feet. It was originally seven hundred and sixty feet square and four hundred and eighty feet high; its outer portions have been removed to furnish stone for building purposes in Cairo. Originally, it was a perfect pyramid; the builders began at the top and filled in, with small stone and cement, the angles formed by the recession of each layer beyond the one below it. Each side was thus left with an even surface sloping at an angle of  $51^{\circ} 50'$ . The outer casing being removed has left the courses of stone in the form of steps nearly four feet high, so that the ascent is not an easy one. There are always plenty of Arabs hanging around the pyramid ready to

assist a traveller who wishes to ascend to the summit. By pulling and pushing him over the steps, they get him up at a reasonably rapid rate; but the exercise is of such a nature, that it frequently leaves him feeling very much as if he had been passed through a patent clothes wringer.

The pyramid contains about eighty-two millions of cubic feet of masonry, and the total weight of the stone used in its construction is estimated at more than six million tons. The entrance is on the north face, fifty feet above the base, and about twenty-four feet from the central line. The passage-way is low and narrow, and extends, in a downward slope of twenty-six degrees, three hundred and twenty feet to the sepulchral chamber. The chamber is forty-six feet long, twenty-seven feet wide, and eleven feet high. There is a branch passage-way leading from the main one, which terminates in a smaller room, called the Queen's Chamber; it is supposed that this room was intended for the resting-place of the queen's body, but it contains no sarcophagus.

In the apartment known as the King's Chamber, the walls and roof are of a highly polished granite, in slabs of great size. The only article of furniture in it is a sarcophagus of red granite, seven and a half feet long, three feet wide, and nearly four feet high. It is too large to be moved through the passage, and must have been placed in the room before the roof was covered. It is supposed that it contained a wooden coffin with the mummy of the king, and that these were taken away when the pyramid was first opened and plundered. In the construction of the pyramids, arrangements were made for closing the passages with blocks of granite, which have greatly retarded all attempts at exploration. It is supposed that there are other apartments yet undiscovered in the Great Pyramid; and at some future day an enterprising and patient explorer may be rewarded with important revelations.

Nearly a thousand years ago, the Great Pyramid was visited, and plundered, and the work of destruction has been renewed at various intervals since that time. But notwithstanding the centuries that have passed since the first visit, new apart-

ments and passages have been discovered within the past thirty years, and several important facts in the history of the pyramids have been obtained from the hieroglyphics on the stones of the interior. Another pyramid near the great one was explored in 1837; a sarcophagus was found, and with it was a mummy case of King Menkuré, but the mummy was gone where the woodbine twineth, or somewhere else. Near the pyramids there is a great number of tombs, some built above the surface, and some excavated in the rock.

The Arabs have opened nearly all the tombs and plundered them of their contents. They have no respect for dead Egyptians, and whenever they find the entrance to a tomb beneath the sands that have been blown from the desert, they quickly open the receptacle and search it for articles of value. The Egyptians used to embalm the bodies of their dead with the greatest care. Professors of the art of embalming were numerous; and judging by the extent of their work, they must have been in constant practice. The first step in the Egyptian method was to put the body in a sort of spicy pickle, where it was kept for two or three months. The viscera and all internal organs were removed to give a better chance to the pickle; and when the work was sufficiently advanced, the body was dried, filled with preserving gums and spices, and properly bandaged. The bandaging of a mummy was one of the fine arts, and sometimes a hundred yards of cloth would be required for a single subject. Every toe and finger had its separate bandage, and the preserving articles were so soaked into the bandages and plastered over them, that there was sometimes more gum and bandage than body.

A close-fitting case or coffin was put outside the mummy, and he was then ready to be packed away for any number of centuries. He kept well, for the work was thoroughly done; and mummies are constantly found in good preservation after a rest of four or five thousand years. The Arabs rob the tombs, and break up the mummies for the gold and silver which were concealed about them; and many a mummy has

come to grief in consequence of attempting to take his money along with him. After the mummy is broken up he makes very good fuel; the Arabs occasionally burn him; and in the early days of the Cairo and Suez Railway, the firemen on the locomotives found that mummies, cut into proper lengths, made a very good substitute for wood and coal. The gums and rags that preserved the mummy are combustible, and thus facilitate his destruction. Arabs and railway stokers are, like the law, no respecters of persons, especially if the persons have been dead forty or fifty centuries. It amuses and benefits these modern Vandals to burn mummies; and it is proper to say, that the mummies don't appear to mind it.

The subterranean tombs and other excavations on the Nile are numerous, and sometimes of great extent. Several of them are so large, that travellers who ventured into them without proper guides have been lost, and have perished for want of food and light. A modern visitor says that after going through several tombs, he felt very much as if he had been rolled in an iron mill. The passages leading into the tombs are long and dark; sometimes they extend hundreds of feet in an indefinite sort of way, and not by a straight course, as a respectable tomb ought to have its entrance. A slender man can get along much more easily than a fat one; the latter gets stuck sometimes, and can easily fancy himself a number ten gun-wad forced into a number eight barrel. An acquaintance of mine once vowed that not for the whole of Egypt would he venture into a tomb again, and that he had done with explorations.

"Ask him about the tomb of Assasseef at Thebes," said a mutual acquaintance, who was sitting between us. We were in a *café* at Rome, and whiling away an evening after a visit to the Coliseum, and the ruins in its vicinity.

"Hang Thebes and all it contains," was the curt reply. "Well, if you insist upon it, you shall have it on condition that you won't speak of it again."

We made the required promise; and after taking an extra sip of brandy and water, he began.

"There were two of us, and we were making the journey

of the Nile in a dahabieh. You know what beastly things those dahabiehs are generally, though sometimes you find one that is quite comfortable. Why the beggarly Egyptians don't call them boats, and be done with it, I never could understand. We landed at Luxor; and after looking at the ruins there, we rode to the tombs of the kings, seven or eight miles away. They mounted me on a donkey so small, that my feet dragged on the ground, and I had to take a reef in my legs to keep from wearing away my boot soles. Jack, my companion, said, that if I wore spurs, I would have to buckle them on just below my knee, as I could not raise my heels without having them so far aft, that they would not reach the animal. There was no necessity for spurs, as we had a boy to run astern of the donkey, and give him an occasional turn in the tail to help him along. The boy kept a firm hold of the tail most of the time, and was helped along by it more than the donkey was. At one time, when we were on the edge of a little ridge, the donkey watched his chance, and let his heels fly into the stomach of the urchin. A prize-fighter couldn't have made a better blow. The boy went rolling down the ridge, and I thought we should have to pay for him, or buy a new one.

"He scrambled up again, and wasn't hurt at all. Evidently he was used to that sort of thing, but I don't believe he liked it, for he made some remarks that sounded very much like swearing. I gave him half a franc, and he appeared satisfied, and ready to be kicked again. He went around behind the donkey, and got into position; but the beast wouldn't respond for an encore, and so the thing was dropped. But you can believe the boy gave that tail fits for the rest of the ride; and by the time we were through, it looked like a piece of old rope with half the strands gone.

"Jack was poetic, and began to blow and recite verses; but I couldn't think of anything except Old Hundred, and the Last Rose of Summer. They wouldn't do for the occasion, and so I amused myself with looking around at the sand and rubbish, and wondering why people came there to see

THE TOMBS OF THE KINGS AT THEBES.

HALL IN THE TOMB OF ASSASSEEF.

them. Thebes must have been a nice sort of a city, but it is very much out of repair now. It is very good as a ruin, but wouldn't be worth much for anything else. All around us there were the remains of temples and palaces that must have cost a great deal of money when they were built. Our guide kept talking about tombs and other cheerful subjects, and by and by he took us to the tomb of Assasseef. I didn't care much about going in, as it was nothing but a hole in the ground, anyhow. Jack insisted, and so we tried it.

"Assasseef wasn't a king, but only a wealthy old priest, who had made money by speculation in stocks or some other way, and wanted to make a permanent investment. So he went into the tomb business, and built a very comfortable one, and larger than any of his neighbors. It has an outer court a hundred feet long, and two thirds wide, and the underground passages run nearly a thousand feet into the mountain. It was all well enough as long as we were above ground, but when we went below it wasn't so comfortable. The walls were black and dirty; the passages were narrow and dusty, and sometimes they were so low that we had to crawl. The bats had a pre-emption claim to the place, and didn't like to be disturbed. They flapped their wings in our faces, and flew around in a way that wasn't pleasant. Jack opened his mouth once to spout a verse of poetry, and got a number three bat between his teeth before he finished the first line. I used to chaff him about it afterwards, and he threatened to bat *me* in the mouth if I didn't stop.

"There were so many bats that the noise they made in the empty vaults and passages seemed like distant thunder, and I began to think the mountain would tumble in. The guide went ahead; and whenever we began to talk of giving it up, he would tell about some wonderful thing a little farther on.

"A good many of the passages were so low and narrow that I had to be pulled in and out by the heels, and it didn't take long to disgust me. I was as dusty as if I had made the campaign of Virginia without being brushed, and the dust I had picked up wasn't of the best kind either. It consisted of pulverized

mummy and other relics of ancient Egypt; and I think I should have made a very good show-piece if I had come home in just the condition in which I emerged from that tomb.

"The joke kept growing worse, till they got me in a place where I had to expel all my breath to crawl through. We got into a sort of room where an Egyptian named something or other had spent thirty-five or forty centuries of his mummy existence; but the place was about as attractive as a bath tub. The mummy had gone, and taken his baggage with him, all but the bats, which kept flying around and making themselves uncomfortable. But when we went to get out, the job was serious. The passage-way, as we came into this tomb, was a descending one, and I got into it by going stern foremost, as a ship drops down a current to pick up a new anchoring spot. But in going out I had to climb up, and that wasn't so easy. The space wasn't large enough for a man of my size to crawl well, as you have to raise your body a little every time you push yourself forward with your hands. For the same reason I couldn't get a purchase with my feet, and I hadn't gone five yards before I stopped. The guide and one of our water-carriers were ahead, while Jack was behind me, and had an Arab to bring up the rear. I yelled out that I couldn't get farther, and the train came to a stop.

"I was frightened, and that made me swell up like your finger when you have a ring on that is a size or so too small. I filled that passage-way as a cork fills the neck of a bottle, and I couldn't stir any more than if I had been anchored. The guide got hold of my arms and pulled, but he couldn't do anything, especially as the place wasn't adapted to towing purposes. What was to be done I couldn't tell; and I began to think I should have to stay there, and be converted into a mummy for the amusement of future visitors.

"Jack and the Arab finally pulled me back by the heels, and the Arab went for a rope. When he brought it we arranged for a new departure. They wanted to put the rope around my neck and pull me along; but I objected to this, as it might result in stretching my neck a little longer than I wanted

it. I looped the thing around me just below the arms; and then the guide and the water-carrier went ahead, and towed me along. It was no easy work, but they got me out at last into the larger passages, where I could get along comparatively easy. The guide said something about a fine tomb farther in the mountain, but I had had all the tombs I wanted for that day, and made as straight a course as I could for the outside. And you don't catch me in a tomb of that sort again if you give me all the kings in Egypt.

"When we got outside, we found a crowd of Arabs with fragments of mummy for sale. They had legs, and arms, and heads in abundance, but the market was rather too high to suit me. In fact I didn't want any mummy, and told the guide to set the fellows adrift. Jack bought a dried arm, and took it back to the boat, but I believe he threw it overboard a few days later. After that adventure, I visited a good many ruins, but only went where I had daylight to guide me. Whenever they told me of a beautiful tomb, and the wonders that it contained, I admitted that it must be very nice, and took everything they said in good faith. I was willing to see the tombs by proxy; and when Jack went inside, I staid where I could look at the Arabs, and study the columns of the ruined temples."

IN all sparsely settled or wild countries, travellers when on journeys are frequently obliged to carry provisions for their entire trip. If they are to go back over the same route they follow in their outward course, they do not carry their provisions the whole distance, but leave them at different points, where they can find them on their return. Especially is this the case where food for the draught or riding animals must be provided. In Northern America and Asia, and in Greenland, Spitzbergen, and other arctic countries, dogs are used for draught purposes; and where a party is travelling it is always necessary to carry a supply of dog food. The favorite article for feeding dogs in winter is dried fish, and great quantities are prepared in the summer months, and stored away where they can be safely kept.

An expedition starting in winter for a journey of ten days will carry ten days' supply of food for dogs and men. If the journey exceeds that time, the allowance must be reduced; and sometimes the party will be on the point of starvation. At the end of each day's journey, it is customary, if the party is to return by the same route, to conceal a day's supply of food, and thus lighten the load as much as possible. There

are several ways of making these deposits. The first requisite is generally to protect the food against wild animals. Poles eight or ten feet high are set upright, and a rude box is made at the top, where the food can be placed. Wolves and foxes are the principal four-footed thieves: they cannot climb, and therefore anything protected in this way is safe from their depredations. Sometimes a hole is made in the ground, and the deposit is placed within it. This can only be safely done in winter, as the soft earth in summer can be dug up by the enterprising and keen-scented animals with very little trouble. A hole in winter can be made secure by pouring water over the replaced earth, and allowing it to freeze. Wolves and foxes can do many things, but they have not yet invented any way to dig through frozen ground. They are wise enough not to attempt it, as they would need a new set of paws every half hour if they followed digging in frozen earth as a means of livelihood.

Baron Wrangell, Dr. Kane, and other arctic explorers, when travelling on the ice of the Polar Sea, used to make holes in the bergs and hummocks, and sometimes in the level ice, which frequently gets a thickness of eight or ten feet. After they had made the deposit in a hole of this sort, they would fit a block of ice as nearly as possible to the opening. After inserting the block they poured water into the interstices, and allowed it to freeze, so as to make the place as solid and even as ever. This was a sufficient protection against small animals, but not always against polar bears. These huge beasts would scent out the food, and with their powerful claws they managed to dig into the ice, and help themselves. Even if the food had been put into strong boxes before it was deposited, the beasts did not seem to be hindered in getting at it, as they would break the boxes as easily as a rat would open an egg-shell. Dr. Kane once tried the plan of sealing the food in sheet iron cans pointed at the ends. Sometimes the bears tossed these cans a while, and then abandoned them: but they generally managed to throw them about with sufficient violence to break the shell and reach the contents.

A healthy and full-grown polar bear is a powerful beast, and has no respect for the laws affecting the ownership of property.

In the extreme north deposits of food are in much greater danger from four-footed beasts than from men. In the first place, the beasts are much more numerous than men, and consequently want more to eat. Men are not very likely, in those wild countries, to come near the deposits, especially in arctic explorations; and even when they find them they are not generally in the habit of stealing. The Esquimaux of the region where Dr. Kane made his explorations are somewhat thievish when they have the opportunity, but the natives of Northern Asia have a high reputation for honesty. There are some tribes that have never learned to steal; they have had very little intercourse with white men, and are thoroughly uncivilized. As an illustration of this barbarous honesty, I will give my own experience among the Koraks of North-eastern Siberia.

My first acquaintance with them was on the shores of the Okhotsk Sea, where they had assembled with their herds of reindeer. When we went ashore we managed somehow to wet our blankets, and I hung mine up to dry. I expressed my fears that the blankets would be stolen by some of the Koraks, but was told that everything would be safe. When we camped at night, my blankets were dry, and I slept in them. But I forgot the blanket-straps, and there they hung in the open air all night, and all the next day.

Now, it is a moral or an immoral certainty that a pair of leather straps, new, and in good condition, in almost any other country would have been taken in hand by somebody who couldn't bear to see them unused. But when I finally thought of my straps, I found them hanging where I had left them thirty hours before, in full view of a dozen or more natives, who were dressed in skins, and didn't know anything more about civilization and the customs of fashionable society than a horse knows about running a sewing-machine.

On our western plains the custom of concealing articles in

the ground prevails over any other mode. The Indians have long practised it, and they manage it so skilfully that it is next to impossible to detect them. The early French settlers and explorers learned the practice from the Indians, and the name they gave to a place of concealment — "*cache*," from *cacher*, to conceal — has been adopted into the language of all plainsmen, of whatever nationality. So well is this word known that many frontier Americans use it in preference to words in their own language having the same meaning. A frontiersman will speak of finding a place where a squirrel had *cached* a peek of nuts, or will tell you that he *cached* his bowie knife in his boot-leg rather than carry it at his waist-belt.

My first acquaintance with a cache on the plains was in the vicinity of Fort Kearney. Our party was camped near a half dozen men who were returning from Salt Lake City, and had lost three of their oxen. We struck up an acquaintance, and in the evening invited them to sit around our fire, where we exchanged news and stories, they telling us of Utah, and we telling them about the States or "God's Country," as one of them called it. "Stranger," said he, "if ever I get back to God's Country, and you catch me again on these yere plains, you may just shoot me for a prairie dog. I've seen all I want of this yere living, and don't hanker for no more of it. I'm a going back where I can have a square meal at a table, and drink whiskey that wouldn't burn a hole through an old boot in five minutes."

We were not bountifully supplied with the necessities of life, but we felt liberal, and ventured to offer a drink of whiskey to each of the strangers. They took it as unhesitatingly as a kitten would take a saucer of new milk, and we became friends in a short time. When we separated, one of the eastward-bound travellers said, —

"May be you'll run short of flour before you get to the mountains, and a little would help you along. Now, we had to lighten up just this side of the Platte crossing, where we lost two of our oxen. We couldn't find anybody to sell to, and as we didn't like to throw things away altogether, we

cached some of them. Next day we met a man one of us knew, and we sold him all the caches but one, and told him where to find them. But there was one bag of flour in a cache away from the rest, and he didn't want no flour; so we didn't tell him where it was."

We offered to buy the flour, but the men would not listen to the proposition.

"It's Utah flour," said one of them, "and isn't very good. The sack is small, and the whole lot wouldn't be worth a great deal; but you can't buy it. You've treated us handsome, and we're not going to be rattlesnakes. We want you to take that flour, and you shan't pay for it."

We thanked them heartily, and proffered another drink, which was accepted and swallowed.

"About five miles this side of the old crossing of the Platte," one of the strangers continued, after wiping the drops of whiskey from his lips, "you will come to a dry creek. There's a small clump of willows on your right hand, and mighty small willows they are too; and on the left side, a dozen yards off the road, there are three buffalo heads piled up, with a sage bush sticking in the top one. Now, you go up the creek past these yere buffalo heads about fifty yards, and you'll see a grave with a little board at one end. On the board are some words which we cut, that says, 'J. MEANS, SALT LAKE, 34 YEARS.' Now, there ain't no J. Means there, but there is a sack of flour, and you'll find it by digging."

We made a memorandum of the direction, and soon after retired to sleep. In the morning we broke camp, and continued our journey, keeping the cache constantly in mind. When we reached the spot indicated, we opened the grave, and found the sack of flour, as our friends of a night had told us we should find it. The soil where it lay was quite dry, and the flour might have been left there for months without serious injury, beyond growing a little musty.

A grave is regarded with respect by nearly all white men and by most savages. Consequently a cache is frequently made in the form of a grave. A head-board bearing the

name, residence, and age of a fictitious dead man, serves to complete the deception, and is likewise useful in describing the cache so that it can be found. All sorts of articles can be placed in the grave, provided they are not of a character to attract wild animals and cause them to dig. In certain localities, the animals, when hungry, will dig into a real grave, and exhume the body to devour it. Thus it happens that the fact that a mound has not been disturbed by beasts sometimes reveals its character to a keen-eyed observer, and tells him that it is a cache, containing something else than the remains of a luckless traveller.

In a journey from Denver to New Mexico, in the autumn of 1860, our party contained one man whose appetite for whiskey was of the keenest and most insatiable. In making up our outfit, we had left a portion of the purchases to him, and he had bought about six times as much fire-water as we really needed. On the first and second day he managed to get as drunk as a Tammany repeater at election time, and was neither ornamental nor useful. On the second night, while he was sleeping, and possibly dreaming of a paradise where there were rivers of pure Bourbon, and no charge to bathers and drinkers, we arranged a plan to bring him to grief. We took a keg of whiskey from our wagon, and cached it a little way from camp. We threw the dirt into the creek, and built a fire over the place of concealment, so that there was no trace of what we had done. In the morning we kept him away from the wagon until we were several miles on the road, and as he had a bottle at his command he did not discover the loss until night.

But when he did discover it, there was trouble in the camp. We dared not tell the truth, for fear he would insist upon returning to recover the treasure. So we feigned ignorance, thought it must have been lost on the road, or left in Denver, or, possibly, the driver had stolen it. We were all certain that it had not been left at the camp, as we had followed the universal custom of emigrants on the plains, and carefully examined the ground after the wagon had started.

To console himself, he went into a condition of blind drunkenness, and remained in it till morning. At this camp we cached a couple of bottles of whiskey, and then solemnly averred, next morning, that he had swallowed them. To all his denials we were incredulous, and we narrated, with great minuteness, how he drank one bottle after another, filling a pint cup at a time, and draining it at a gulp. He finally began to believe that we were right, and for the rest of the journey he kept comparatively sober.

On our return, two weeks later, we had a long day's journey before us to reach "Two-Bottle Camp," as we had named it. In the morning we made a general confession to the old fellow, and owned up to the theft and concealment of the bottles. His rage at the deception practised upon him was great, but it was not equal to his joy at knowing there was happiness ahead. Never on the whole journey did he exert himself more than on that day to keep the wagon in motion, and enable us to reach the whiskey-hunting ground by sunset. To him the camp of the Two Bottles was like a harbor for which the storm-tossed mariner hopes and prays when the gale is upon him, and his ship is lying at the mercy of the wind; and as soon as we reached it, he made a rapid break for the cache, and opened it before the wagon was fairly halted.

He forgave us everything, and for that evening we had a millennium on a small scale. We compelled him to retain one bottle for the festivities of the next evening, as we wanted him to go to town sober, and consequently determined to ex-hume the keg, and put it in the wagon without his knowledge. Everything was lovely; the keg was secured, and when we reached Denver, we pretended to discover it in the office whence we had started.

In the days of the great emigration overland in 1849 and '50, the emigrants frequently found their wagons too heavily burdened, and were obliged to throw away or cache a large part of their loads. When they cached their goods, the Indians generally found them, as the work was almost always

done carelessly and in haste, so that traces of it could be plainly seen. One old plainsman once described to me a cache which was made by a party to which he belonged.

"We found," said he, "that we must lighten up our wagons; and so we concluded to stop a day or two, make a cache, and give our animals a chance to rest. We were near the Wind River Mountains, and Indians were not abundant. We had seen none for several days, and thought we could rely upon doing our work without their seeing us. We were in camp when we decided to make the cache, and at daylight next morning two of us started out to find a good place.

"About three miles off the trail we found a bluff that was quite steep towards a small river that we named Lost Ox River, because one of our oxen afterwards got into the quicksand and was drowned. We thought this bluff would be a good place for a cache, as we could throw the dirt into the river and have it washed away. The bluff was hard and dry, and would keep things from spoiling.

"We drove the train into the valley, at the foot of the bluff, and then went to work. We made a hole about three feet square, and as many deep, and then we hollowed out a space as large as a good-sized room. We did not drop an ounce of dirt around the opening, but threw it all into the river. We spread blankets and sacks all around the opening, and laid a row of them from the hole to our camp, so that the ground wouldn't be trodden up.

"Then we lightened our wagons of everything we could spare. There were bundles of goods, extra clothing, saddles, chains, boots, and everything we thought it possible to do without. When the hole was full, we put the stump of a tree into the opening, and scattered leaves and rubbish around it, so that nobody could possibly see that the earth had ever been disturbed.

"It took us three days to make the cache. Our mules and oxen had gathered strength, and we moved on, with a good prospect of getting through to California.

"But things grew worse instead of better. When we got

into the alkali plains our oxen died off fast, and we had to throw away something every day. With so much bad luck it was quite natural that we should get into rows among ourselves, and the upshot of it was, that we separated. Some of us were discouraged, and wanted to go back; and we did go back.

"Four of us took our rifles, and each picked out a riding mule to carry us to the Missouri River. We had two pack mules, and thought we could somehow manage to get through. We had a hard time of it, stranger, and didn't get farther than Laramie, where we broke up, and concluded to try our luck at anything that turned up.

"When we got to where we left the trail to make our cache, I told the boys we had better go and see if it was all right. Three of us went there, and left the other to take care of the animals.

"Somehow the Indians had found out the whole thing. We don't know how they did it, but it was most likely that the wolves and foxes went to digging there for the leather in the boots and saddles, and the Indians saw where they dug, and knew something was hid. All around there were tracks of Indians, and they had taken out more than half of what we had put there.

"While we were talking about the business, and cursing the redskins, we saw five of them coming up the valley. There were four bucks and one squaw, and they hadn't seen us. So we just laid low and waited for them. They stopped at the foot of the bluff, and the bucks made for the hole, leaving the squaw to take care of their ponies and keep watch.

"The squaw sat down, with her back against a tree, about fifty feet from where we were. She was evidently tired, for she dropped her head forward, and didn't keep much of a watch. Jim Foster, one of the fellows with me, was an old Indian hunter, and knew how to work. He crept up behind her, slipped the belt from his waist, and before she knew what she was about, he had the belt around her neck, and fastened her to the tree. As soon as he had her fast, the other fellow

and I ran to the cache, picked up the stump that had been in the hole originally, and put it where it belonged. Then we piled logs and rubbish on top, and stopped up the crevices, and waited a couple of hours, until we thought they had breathed all the air up and were good Indians."

"What do you mean by good Indians?" I asked.

"Why, don't you know," said he, "that all good Indians are dead Indians?"

I saw his point, and after he had terminated the smile with which his axiom was delivered, he went on with the story.

"We made sure that they would never do any more stealing. We didn't want to kill them, of course, but we thought it would be no more than right to cache them along with the property that was left. There never was a better use made of an Indian than to cache him. As soon as we were satisfied that they couldn't get out, we took the ponies and went to where our fourth man was waiting with the mules. We distributed our loads on the mules, took the ponies to ride on, and you may believe that we travelled our level best out of that region."

"And the squaw," I asked; "did she go with you?"

"O, I forgot about her. Jim was a careless sort of a fellow, and he pulled that strap so close around her neck that she never recovered. Come to think of it, she didn't live long, not more than five minutes, and Jim was very sorry. He said he would do the best he could for her, and seeing she was dead, he wouldn't refuse to bury her. So he carried her to the river, where there was a good bed of quicksand, and dropped her in. She sunk easy, and I reckon she's somewhere about there now. She had a lot of silver ornaments about her, and Jim felt so bad that he kept them to remember her by. He said it would be a shame to waste them, as silver was scarce in that country. He wanted to go back, and see if the bucks had something valuable about them; but I thought we had done a fair morning's work in living the ponies, and it was best to be getting away from there before any more Indians came around. And we up and travelled lively."

## XXII.

### THE GREEN VAULTS OF DRESDEN.

THE RICHEST TREASURY IN THE WORLD. — HOW THE SAXON PRINCES ACQUIRED IT. — THE DIFFERENT CABINETS, AND WHAT THEY CONTAIN. — WONDERFUL CARVINGS, MOSAICS, AND CURIOSITIES. — SPLENDID GOLD AND SILVER PLATE. — MAGNIFICENT ROYAL REGALIA. — A LUXURIOUS AND GALLANT MONARCH. — HIS ROMANTIC ADVENTURES. — A MARVELLOUS TOY. — DAZZLING EMERALDS, PEARLS, RUBIES, AND DIAMONDS. — THE LARGEST AND MOST PRECIOUS GEMS ON THE GLOBE. — INGENIOUS AND DESPERATE ATTEMPTS TO ROB THE VAULTS. — A THIEF WALLED UP ALIVE. — EFFECT OF EXPOSING HIS SKELETON. — ARE THE PRICELESS JEWELS FALSE? — WHAT AN ENTERPRISING SCOUNDREL MIGHT ACCOMPLISH.

THE Green Vaults (*Grüne Gewölbe*) of Dresden, as they are called from the hue of the hangings which once covered them, are in the Zwinger, a group of buildings erected by Augustus II. as a vestibule to a new palace. They are not under ground as might be supposed from their name, and from the fact that they contain the treasures of the King of Saxony. They are vaulted apartments, eight in number, stored with rare carving, mosaics, gold and silver plate, precious stones, and an endless variety of curious and invaluable articles.

The collection is the richest possessed by any European monarch, and altogether beyond what so small a power would be thought able to collect or keep. The Saxon princes, it must be remembered, however, were of far more consequence and influence in the past than they are in the present. The Freiberg silver mines alone were a source of immense revenue before the discovery of America, and Saxony had various means of acquiring wealth of which she is now wholly deprived.

I have examined nearly all the royal treasuries abroad, and none of them are at all equal to the collection in Dresden,

which is likely to create an agreeable surprise even after one has heard its variety and value extolled. I have known political economists to regret that what might be converted into so much money should be allowed to lie idle, and I have met others, again, who regarded the treasures of art and the priceless jewels gathered there as so many baubles unworthy of serious consideration. Persons of cultivated taste and lovers of beauty, however, can hardly be so narrow in their opinions, for they will find in the Green Vaults something more than capital uninvested, or glittering toys. The princes deserve commendation for the liberal manner in which they expended their wealth for the æsthetic benefit of those to come after them.

The apartments are so arranged that each one you enter surpasses the last in interest and the variety of its contents. A great deal of space would be required to enumerate all the articles, though the principal may be easily set down.

The first apartment is devoted to bronzes of the nicest and most curious workmanship. There are copies in miniature of some of the famous statues, that cannot be fully appreciated without close attention to detail and a liberal understanding of art. A crucifix by John of Bologna, and a small dog, stretching itself, by Peter Visscher, are masterpieces of their kind.

In the second apartment are ivory carvings of remarkable excellence ; among them a number of beautiful vases, some quite large, cut out of a single piece. There are, also, a battle scene by Albrecht Durer, a crucifix by Michael Angelo, and a marvellous group of some ninety figures carved in one piece sixteen inches high, representing the fall of Lucifer and his wicked angels. Nothing could be finer or more exact than these figures. Small as they are, they are perfect, and plainly show what extraordinary patience and skill the artist must have had. A goblet, of stag's horn, cut like a cameo, in figures portraying the chase, is admirably wrought, as is also a cup on which the story of the Foolish Virgins is delineated.

The third apartment has Florentine mosaics, engraved shells, ostrich eggs carved and ornamented, a singular chimney-piece of Dresden china set with precious stones, paintings in enamel, and a number of portraits of historic characters, the most noticeable of which are Peter the Great and Augustus II., surnamed the Strong.

The fourth apartment is filled with the gold and silver plate formerly used at the banquets of the Saxon princes, a portion of which was wont to be carried to Frankfort on the occasion of the coronation of the German emperors by the electors of Saxony, who held the hereditary office of arch-marshal at those imposing ceremonies. Beyond the mere value, this plate is not desirable. If it were mine, I should melt it at once into the coin of the realm, since it has neither grace nor beauty of form. It may seem very grand to eat and drink out of such vessels, but they would be found extremely inconvenient for practical purposes. The china of our day is altogether superior to all the gold and silver plate that has ever been heaped on royal tables.

The fifth apartment is taken up with agates, crystals, chalcidony, lapis lazuli, and other varieties of semi-precious stones. Some cups of moss agates are particularly beautiful, and two goblets, composed entirely of cut gems, have a value of ten thousand dollars each. An equestrian statue of Charles II. of England, made from a solid piece of cast iron, represents him in the character of St. George, and is skilfully done. The eminent sculptor, Colin of Mechlin, has shown the cunning of his art by two spirited combats of knights, though they are only wooden heads; wood being the material of which the carvings are made. The largest enamel painting known, a Magdalen by Dinglinger, is also shown there.

The sixth apartment abounds in figures carved in ivory and wood, many of them caricatures of men and animals, which express the grotesqueness of the German mind. Single pearls of extraordinary size, nearly all found in the River Elster, are cut into odd shapes, some of them representing rustics, jesters, and elves. A pearl, large as a hen's egg, is

intended to portray a Spanish court dwarf, and is superbly done. Trinket as it is, it could not be purchased for twenty-five thousand dollars. There is, besides, any number of costly trifles, on which a vast deal of ingenuity and money must have been expended, and which are interesting from their artistic merit.

The seventh apartment is radiant with the splendid regalia used at the coronation of Augustus II.

Augustus is inseparably associated with the history of Saxony, and the antecedents of Dresden. He succeeded his father, John George III., as Elector of Saxony, though not until after his elder brother's death, in 1694, and was elected to the throne of Poland, made vacant, two years later, by the decease of John Sobieski. The Polish nobles were unwilling to be ruled over by anybody but a Roman Catholic, and Augustus, whose theology was of a very accommodating quality, abandoned Protestantism for the sake of the crown.

Between his wars, his intrigues, and his parades, his sixty-three years of life were superlatively busy. He was highly educated for his time, and so much interested in art that he began the collection of pictures in the Dresden Gallery, and purchased many of the valuable curiosities now in the Green Vaults. His reign was marked by luxury and splendor, and his court was the constant resort of artists, alchemists, and adventurers of both sexes, on whom he lavished countless favors. The celebrated Countess of Königsmark was one of his many mistresses, and bore him a son, who subsequently figured so prominently in French history as Maurice, Count de Saxe.

Augustus was such a prodigal that he loaded Saxony with debt, and inspired the magnates of Poland to imitate his improvident example in Warsaw. Elegant, accomplished, daring, and unscrupulous, he made war on men and love to women to the end of his days. If all the accounts be true, he was as charming as Apollo and as strong as Hercules. The archives of Dresden attest his wonderful muscle to such a

degree that Samson would have been no match for him. One of his pastimes was to become enamoured of some distinguished lady he had never seen ; go in search of her ; throw her husband, father, or brother, just as it happened, over high walls, and then carry her off in his arms as if she had been a feather weight.

These tales are interesting, but there are too many of them to be credible. I cannot tell how large the Saxon or Polish women were a century and a half ago, but I will lay a large wager that Augustus could not carry very far many of them I have seen recently. If he had the taste ascribed to him, I am sure he would not make the attempt, unless it should happen to be in the night, when darkness reduces beauties and beldames to the same level.

Persons going to Dresden, or indeed to any part of Saxony, will spare themselves questions by presuming that Augustus has done nearly everything worth doing in the entire kingdom. He is to Saxony what St. Patrick is to the south of Ireland, King David to Scotland, or Charles V. to Belgium.

The eighth and last apartment entirely eclipses all the others in the richness and magnificence of its contents. One of the wonders of this cabinet, called the Court of the Great Mogul, was made by Dinglinger, an artist justly considered the Benvenuto Cellini of Saxony. The Court represents the Emperor Aurengzebe on his throne, surrounded by courtiers and soldiers, — about one hundred and forty figures, — in pure gold enamelled, attired in costumes appropriate to the country and the time. Each figure has its individual expression and character, as will be perceived by close observation.

This marvellous toy, which is really a work of the highest art, employed Dinglinger (he was the court jeweller during the early part of the eighteenth century) for nearly ten years, and cost one hundred thousand dollars. Another carving of a similar character portrays different artisans with a fineness and finish which no one would expect, considering its diminutive proportions. There are also other specimens of his

exceeding skill that fully entitle him to the fame he has achieved.

A specimen of uncut Peruvian emeralds, bestowed by the Emperor Charles V. on the Elector of Saxony, is one of the finest in the world, and a mass of solid native silver from the Himmelfüst mine of Freiberg so well illustrates its richness as to enable me to believe that in fifty years nearly twenty-two hundred tons of silver were obtained from that single mine.

The Saxon regalia there exhibited includes the sword of the elector, carried by the princes at the imperial coronations; the decorations of a miner's uniform made for the Elector John George; a great number of chains, collars, and orders of the Garter, Golden Fleece, and Polish Eagle; and a curious antique portrait (a cameo of onyx) of Augustus the Strong. A sardonyx six and a half inches long, and four and a half broad, reputed to be the largest extant, attracts much attention from its oval shape and beautiful regularity.

Two rings once worn by Martin Luther appeal not a little to earnest Protestants. One of these, an enamelled seal ring, cut with a death's head, and the motto "*Mori sæpe cogita*" (Reflect often on death), is sufficiently mournful in suggestion to satisfy the most dismal of theologians. The other ring is a carnelian bearing a rose, and in its centre a cross.

Then comes a glass case of the rarest and costliest jewels, the first division containing superb sapphires, the largest of them uncut, the gift of Peter the Great. The second division is full of splendid emeralds; the third of magnificent rubies (the two largest weighing forty-eight and sixty carats); the fourth abounding in beautiful pearls, one native set being little inferior to the Oriental; while the fifth division is radiant with diamonds.

Such another collection does not exist anywhere in the world. If these diamonds were sold for the sum they would very readily bring, they would more than pay off, it is said, the

entire national debt of Saxony. The diamond decorations for the gala dress of the elector consists of buttons, collar, sword and scabbard, all incrustated with the largest and most valuable stones, some of them weighing fifty carats each. The most remarkable of the stones is a green brilliant, weighing one hundred and sixty carats, and said to be worth two millions of dollars. There are also various orders studded with diamonds and many single gems, yellow, rose, and green in color, as well as pure white.

Admirers of diamonds can have an ocular banquet there; for the collection is magnificent beyond description. I have seen women hang over them until their eyes fairly watered (I wonder if this is the reason they are called gems of the first water), and I have noticed men regard them with a passion for possession that savored of wildness. As mere objects of beauty, they are deserving of all admiration. Those priceless gems are constant miracle-workers. The smallest ray of light that falls upon them is converted into a glorious sheen. They make the very atmosphere brilliant, emitting from every point a radiance which is dazzling. Hardly any conjuration of magic can be greater. The blaze of jewels, when the sunlight touches them, is almost overpowering. The mines of Golconda, as they were in their palmiest days, appear to be open, and all their glorious treasures to be flashing, scintillating, coruscating at once.

One might imagine that the diamonds and many of the other valuables of the Green Vaults would be in danger from the admission of strangers. The naturalness of this opinion has doubtless given rise to the story that unseen soldiers have their muskets levelled through invisible loopholes in the walls at the head or breast of everybody entering the royal treasury. This is a mere romance, never having had the smallest foundation in fact. Such precautions are not at all necessary; for nobody could steal anything, and get away with it, even if he should try. The costliest objects are covered with strong iron or steel wires, not sufficient to obstruct the view, but enough to prevent their seizure by any designing or dis-

honest person. Moreover, the custodian, who conducts you through the cabinets, locks and bolts each door after him, so that the thief could not easily make his escape; and if he did succeed in getting beyond the walls, an alarm would be immediately given, which would almost necessarily insure his capture.

The value of the entire collection at Dresden it is almost impossible to give. I have heard it estimated at from twenty millions to twenty-five millions of dollars, and even as high as fifty millions. Most of the works of art, as well as the jewels, are actually beyond price; for they could not be replaced. They could not be purchased any more than the Raffiellies, Correggios, and Titians, in the famous Picture Gallery in the same city.

It is said that numerous efforts have been made during the past hundred years to rob the Green Vaults.

One of these was by two Poles, who had had a wide experience in forgery, burglary, and crimes of all sorts, in the early part of the present century. They had at first designed to secure a number of confederates, but afterwards abandoned the idea, fearing that their secret would be unsafe when so many persons shared it. After revolving various plans in their mind, they concluded to depend upon themselves alone, and accordingly entered the vaults, pretending to be Protestant clergymen from Geneva, in company with a large party of visitors, composed mostly of Englishmen and Americans. When they had reached the last cabinet, and while one of them was making particular inquiries of the custodian, and attracting the attention of the party by his large fund of information (he spoke English with remarkable facility), his companion contrived to hide himself in something closely resembling a bale, the material for which he had concealed upon his person. A quarter of an hour after, one of the supposed-to-be clergymen was missed, and his disappearance was explained by the positive statement of his confederate that he had returned to his hotel while they were in the third apartment, having an engagement that demanded his pres-

ence. A number of the visitors thought they had seen him a few minutes before; but the disguised Pole was so positive in his declaration, that they naturally fancied themselves mistaken.

The party at last went out, and late that night the concealed villain, who was prepared with matches and a dark lantern, crept out of his spurious bale, and, with instruments provided beforehand, got into the cases, cut the wires, and secured many of the most precious diamonds. He then attempted to get out of the vaults, but, to his astonishment and consternation, they were too strong for him. The partner of his guilt was at his appointed post on the outside, and waited in vain until daylight for the robber who was to come forth at a stated hour with his treasures. The other Pole had secured his great wealth; but, by a strange shortsightedness not uncommon to villains of his class, he had not calculated closely enough upon the means of getting away with it. Finding that the vaults were his prison, he tried to put the jewels back in such a shape that their displacement would not be noticed, and then crept once more into his bale. The custodian entered with a number of sight-seers about noon the day following. His quick eye discovered at once that the diamonds had been tampered with, and this fact, taken in connection with the mysterious disappearance of the previous day, confirmed him in the belief that a robbery had been attempted, and that the robber must be hidden in that particular apartment. Consequently he ordered a guard, and a thorough search having been made, the thief was soon exposed. The scoundrel, knowing it would be useless to deny his design, made a full confession in respect to himself, and was tried and sentenced to prison for twenty-five years, equivalent to life, for he was at the time of his capture more than fifty-five. After serving ten years of his sentence, he made his escape by bribing, as it was supposed, some of the officials, and not long after was killed in Palermo while attempting to break into the house of an English resident of the Sicilian city.

About 1798 some twenty Viennese rogues went to Dresden for the express purpose of robbing the Green Vaults of their most valuable jewels. Their plan was to undermine the treasury, enter it by night, and make their egress by the same channel. Their scheme was bold, and might have prospered, beset as it was with obstacles. Any and all result was frustrated, however, by the betrayal of the gang by one of its number, tempted by the hope of a liberal reward for his treachery. He was, it is asserted, handsomely paid, and the information which he furnished caused the arrest of three of the conspirators; the rest leaving the city suddenly, and placing themselves beyond the reach of the law. Two of the miscreants were sent to prison, and the third, who was a native Greek, and reported to have been for some years a brigand, cheated justice by poisoning himself in his cell.

About fifty years ago, as the story is told in Dresden, certain changes were made in the Green Vaults, involving the laying of a new interior wall of brick. This intended addition having become generally known, an enterprising rogue in the city conceived a plan of robbing the treasury by concealing himself in a part of the wall then unfinished; designing to get out at night, after the workmen had gone away, and carry off whatever was lightest and of most value. He did succeed in concealing himself, as he had wished; but unfortunately for him, the masons worked more rapidly than he had supposed they would, and enclosed him completely. Whether he knew at the time what would happen, and was afraid of revealing his presence, or whether he was totally ignorant of the peril of his situation, will forever remain unknown. As may be imagined, the thief, being, like other mortals, unable to live without air, soon succumbed to his peculiar surroundings, though his fate was a secret for years after.

New improvements, then making, caused the removal of the brick wall, and within it the perfect skeleton of a man was discovered. Great and exciting was the mystery at first; but diligent inquiry, and vivid recalling of the date when the

work was done, solved the enigma by establishing a connection between the finding of the skeleton and the disappearance of a certain notorious criminal. The skeleton of the thief was put together, and for some time occupied a conspicuous position in the vaults, as a warning to all inclined to follow his example. But it served as an example instead, as was shown by the fact that several attempts at robbery were made there within six months after the grim exposure. The skeleton was then removed from the vaults, and as is popularly supposed, has been transferred in a multiplied form to the private closets of the Dresdeners.

Not a great while ago, a story was started to the effect that the principal diamonds in the Green Vaults had been stolen by some of the officials of the court, and replaced with counterfeit stones. This report obtained wide currency, and was generally believed among the common people. It may be inferred that there was no basis whatever for the tale, as any one who is a judge of jewels may easily determine for himself. If it were possible to make such excellent counterfeits of diamonds as are those now at Dresden, genuine gems would certainly lose much of their value, since there would be no method of distinguishing between the real and spurious.

The contents of the Green Vaults have for generations been a source of anxiety to the Saxon princes. Again and again, during the troublous times in Germany, they have been compelled to carry their treasures to the mountains in the region along the Elbe, known as the Saxon Switzerland, and to keep them there for security until the peril of plunder had passed. This sudden transportation of the royal valuables was very frequent during the Seven Years' War, and it is reported that many of them were lost in the haste and excitement attending their removal.

The Green Vaults offer a constant temptation to the rogues of the old world, and it would not be at all surprising if some man or men, possessed of a rare genius for pilfering, should yet accomplish what has so frequently failed. Robbery and

burglary are so much a profession nowadays, and so much real talent is employed in their behalf, that those who have been graduated in the calling will be inconsiderate of their own interest if they do not some time perfect a scheme which will result in plundering the greatest and richest treasury on the globe.

A rich reward awaits any one who will enter the Green Vaults of Dresden and carry away their treasures, or so much of them as could be easily carried by one man. Possibly an American or English burglar will yet be found who can succeed in this daring enterprise.

## XXIII.

### THE CATACOMBS OF PARIS.

THE FAIR CAPITAL UNDERMINED. — HISTORY OF THE VAST GRAVEYARD. — SIX MILLIONS OF SKELETONS. — A JOURNEY THROUGH THE CITY OF THE DEAD. — HORRIBLE SENSATIONS OF BEING LOST THERE. — GHASTLY DISPLAY OF SKULLS AND BONES. — TRAGIC AND COMIC INCIDENTS. — TERRIBLE EXPERIENCE IN THE MIGHTY CHARNEL-HOUSE. — SCENES NEVER TO BE FORGOTTEN.

FEW persons think, while strolling through the fashionable streets of Paris, and seeking pleasure in its charming precincts, that they are wandering over a vast graveyard, and that only a thin crust of earth separates them from the burial-place of six millions of human beings. Down there lie the remains of a third as many people as the entire French capital contains. A large part of the beautiful city is undermined by vaults, and these vaults, which are the famous Catacombs of Paris, contain the dead of centuries.

The Catacombs of Paris are not used, like the Catacombs of ancient Thebes, Rome, and Naples, as places of original sepulture; for they were once quarries from which the stone employed in building the city was taken. The quarries were beneath the southern part of the town, directly below the Observatory, the Luxembourg, the Odéon, the Pantheon, and many of the well-known streets, such as St. Jacques, La Harpe, Tournou, Vaugirard, and others. Their extent is estimated to be about three millions of square yards; and long before they were cemeteries, they served as refuge and shelter for thieves, incendiaries, assassins, and all the desperate criminals who for many centuries abounded in the city. It is only a little more than a hundred years since Paris has been orderly, or in any sense secure. During the middle ages, and down to

the latter half of the past century, property and life were extremely unsafe. Ruffians stalked abroad by day as well as by night, and bade defiance to law and its guardians. In those times the quarries shielded many of the greatest villains in the capital. After committing robbery, arson, or murder, they fled into those excavations, and the men whose duty it was to arrest them were afraid to follow where they would certainly have been massacred. Many are the stories told of policemen and soldiers meeting their death in the subterranean vaults at the hands of the malefactors they were pursuing. These were so familiar with all the recesses and windings of the quarries that they could not only escape, but they could lie in ambush, and fall upon the officers of the law with terrible vengeance. So numerous were the murders committed in the quarries by ruffians of the olden time, that finally none of the king's minions could be found bold enough to venture into those abodes of mystery, darkness, and crime.

In 1784 some part of the quarries was broken through from above, and as there was imminent danger of the houses in the streets falling into ruin from similar accidents, a number of the most skillful engineers were ordered by the government to descend into the quarries, make a careful investigation, and render them in future altogether secure. While so engaged, M. Lenoir, lieutenant general of the police, conceived the idea of removing to the vaults the remains that had been buried in the cemetery of the Innocents, then standing on the present site of the Halles Centrales, the principal market of the city. Other graveyards within the municipal limits needed to be emptied, and it was determined that the contents of these graves should also be transferred to the subterranean region; so, on the 7th of April, 1786, a formal consecration of the Catacombs as a place of burial took place with imposing religious rites and ceremonies. The human bones were borne from the graves at night in funeral cars, accompanied by priests decked in their sacerdotal robes, carrying torches, swinging censers, and chanting the Roman

Catholic service for the dead, and on arriving at the depository were hurled down a shaft in magnificently miscellaneous confusion. Such a democratic mixture, osseously speaking, of saints and sinners, princes and peasants, reformers and robbers, bishops and beggars, poets and pickpockets, grand ladies and grisettes, coquettes and cocottes, was never before made on the banks of the Seine. This superb disorder remains to the present day, so far as rank and caste are concerned. The skull of a pious prelate rests upon the ribs of a desperate cutthroat, and the thigh-bone of a once renowned beauty of the Faubourg St. Germain touches the grinning teeth of a vulgar conscript shot for desertion. The skeleton arms of a dainty poet are interlocked with those of a hideous hag who poisoned her father and mother in the Rue de la Croix Rouge.

If the opinion be well founded, that on the day of judgment the dead will arise in their proper persons, the unfortunates buried in the Catacombs of Paris will find it an extremely arduous task to collect themselves together. One might imagine, in such a universal resumption of long-cast-off and worn-out fleshly garments, that some nondescript individual might appear on the awful scene with the head of a marquis on the trunk of a rag-picker, borne along by the legs of a ballet dancer, and a cripple gesticulating to the angelic host with the right arm of a cardinal and the left arm of a lorette. It has long been a theological problem whether, on that solemn occasion, the dead will recognize each other; but it will be a matter of even more serious moment to them whether many of the Parisians will be able, so strangely will they be made up, to recognize themselves. That there will be a rattling among the dry bones no one who has entered the Catacombs can doubt, and that much of the rattling will arise from Monsieur Bonjour's effort to make a complete conjunction with his remains, and from Madame Beaujoli's endeavor to hunt herself up, must be plain to everybody. Some of these anticipated troubles may be partially obviated, however, by the fact that the bones from one cemetery have been kept

apart from the bones of another; and as this predicted resurrection is not likely to occur for some time, we need not concern ourselves in regard to the hypothetical awkwardness and inconveniences of so distant a future.

Until within a few years, admission to the Catacombs could be readily obtained; but their insecurity, resulting in a number of accidents, has recently prevented the authorities from opening these gloomy recesses to the public more than once annually, — usually about the first of October, — when a few persons are permitted, after obtaining tickets from the inspector general, to accompany him in his subterranean tour. The first time I visited Paris I was extremely anxious to wander through the Catacombs; but finding many obstacles in my way, and being much occupied otherwise, I quitted the city without gratifying my curiosity. I returned, however, ere long, and was so diligent in prosecuting my purpose that one pleasant autumn morning, in company with a dozen strangers, I descended from the garden of the city custom-house at the Barrière d'Enfer to explore the stony chambers of the dead.

We had provided ourselves with wax tapers, which we lighted, each of us carrying one, before we went down a circular flight of some one hundred steps leading to the dismal galleries running in every direction, and containing the ghastly remains of millions of our fellow-creatures, once as merry and ambitious, as fond and foolish, as hopeful and as vain, as any of us are to-day. At the bottom of the staircase a guide placed himself at our head, and, observing that our tapers were all in good order, took the lead, after exhorting us to keep together, and on no account, if we valued our lives, to attempt to explore any other than the main avenues through which we were to pass.

The Catacombs hold the victims of the different revolutions so frequent in Paris; and now, moreover, the common graves (*les fosses communes*) in the three principal cemeteries of Montmartre, Mont Parnasse and Père la Chaise, are emptied every five years, and the plebeian relics consigned to the

Catacombs, to make room for more bodies in those populous burying-grounds. Thus are the great vaults steadily and rapidly increasing their lifeless hosts, and adding to the horrors of a region necessarily horrible from the first.

Several hundred yards from the base of the steps which we had descended is an octagonal vestibule, and over it an inscription in Latin to this effect: "Beyond these boundaries repose those who await a blessed immortality." We passed through a door leading into a long gallery lined with bones from the floor to the roof; the arm, leg, and thigh-bones being closely and regularly piled together in front, their uniformity relieved by three rows of skulls at equal distances, while behind these the smaller bones are thrown, regardless of arrangement of any kind. The gallery conducts to several apartments resembling chapels, called Tombs of the Revolutions, and Tombs of the Victims, because they hold the relics of those who had perished in popular insurrections against existing authority. I had noticed, before reaching the vestibule, and what may be considered the Catacombs proper, that the passage was very narrow, — only two persons being able to walk abreast therein, — and little more than six feet in height. This passage soon made a sharp turn, and at the corner the names of the streets directly above were cut into the stone, and two black arrows painted upon it, one pointing to the entrance of the vaults, and the other to the great charnel-house we were about to explore. We were in chambers of hewn-out rock. Rock was above us, below us, and on every side. The walls were very damp, the water in many places dripping through what might be termed the ceiling, in which were so many cracks and crevices that it seemed as if the walls might tumble and bury us at any moment. Two or three of my companions grew very nervous as they perceived about them such alarming signs of insecurity, and expressed the wish that they had not undertaken what they declared to be a foolhardy enterprise. As I walked along, I saw at different turnings of the passage what appeared to be deep, yawning pits; and feeling a curiosity to examine them, I stopped and stretched my taper over

the side. Appearances were not deceitful. The deep pits were really there — dark, awful, and impenetrable. I could not help thinking how easy it would be for any one who should get lost and become bewildered, to stumble into one of those fearful holes and dash his brains out. Even such a dreary death would be infinitely preferable to the long agony of confinement in, without any hope of release from, such a place of horrors. While I was speculating on the possibility of the situation, the little procession got quite beyond me, and I was aroused from my gloomy reverie by the echoing voice of the guide urging the members of our party to keep close together. I hurried forward just in time to see the door of the vestibule open, and to go in with the rest.

The Catacombs are laid out very much like the old quarters of Paris, the different avenues being named after the streets above them, and the principal buildings overhead being indicated on the walls. It seemed very strange that certain famous structures, with which I am very familiar, should be only eighty or a hundred feet from where we were walking, as those sepulchral caverns appeared hundreds of miles away from the bright and beautiful city we had quitted half an hour before. Nothing can be more dismal and depressing than the Catacombs, with their miles and miles of human bones and skulls confronting you wherever you turn, and seeming to dance and grin as the light and the shadow of the passing tapers fall upon them.

How easily we are cheated by the imagination! I could almost have sworn, as I hurried by, that I saw some of the thigh-bones move to and fro, and the jaws of the skulls open and shut, and extend, in ghastly grimace, a repulsive welcome from the dead to the living, who would soon be no more than those hideous remains. There is a certain fascination, however, I must confess, in the sombre, subterranean city. The parade and panoply of grim mortality held me like a spell, and again and again I found myself far in the rear of the solemn excursionists. I liked to fall behind and watch the thick shadows which gave way before and closed in behind

them, and listen to the hollow and dreary echoes of their voices murmuring through the mighty vaults. I fancied the babbling company to be a crew of resurgent spirits, whose duty it was to visit the cemeteries of the globe, and awake the dead to judgment. They had a certain weird semblance as they flitted on in the dim distance, and their tones came back to me as if they had fallen from tongues long silent in the grave. The fancy pleased me, and I indulged it, and the kindred fancy that the heaps of bones were animated, until, sometimes, so strong were the suggestions of the place, I really confounded the living with the dead.

Once, in going by an avenue running to the right, I yielded to a temptation to step into it, to look at an extraordinary heap of bones. This did not occupy more than thirty seconds,—at least, it did not appear longer,—and yet, when I stepped back into the broader passage (the main avenues in the Catacombs are much wider than those I have mentioned outside the vestibule), I found, to my utter consternation and horror, that my companions had left me; I could not see the light of their tapers, nor could I hear the least echo of their steps or voices.

Lost in the Catacombs! How often I had imagined it! and now, indeed, it had become a terrible reality. Horror almost paralyzed me for the moment. I seemed to be all nerve and brain, and these thrilled and throbbed so wildly that I was forced to lean against the rock for support. I thought I should go mad, for there was something in the very idea of being shut up in that awful cavern, in the awful silence and awful darkness, doomed to perish by inches, every hour expanding to an age, which rendered any other means of death blissful by contrast. My head swam, and I believed I was about to swoon, when, feeling that to do so was to be destroyed, I roused my will and almost involuntarily sprang forward. My movement was so sudden that my taper was extinguished, and an inky blackness fell upon me like a pall. The horror of my situation was a hundred-fold increased. If I could have lighted my little candle again, I should have

been almost happy ; and yet, a few seconds before, I had regarded myself as the most miserable of mortals. My brain seemed to be absolutely bursting, and my heart forcing itself into my throat. I was conscious of a sense of suffocation, and I was not sure that the rocky walls were not pressing together to crush me. I remember having an anxious longing that they might do so, and end the agony I was enduring. I frankly admit I had never known before what human suffering can be. I had not supposed myself capable of such mental anguish ; it was ten thousand times more, and worse, than death — an indefinable and overwhelming dread of something which might not be named, but that could be pictured with miraculous power. I had confronted death often, in sickness, in catastrophe, in battle, on land and water, by falling, and by fire, and the so-called King of Terrors had not shown himself half so terrible as I had anticipated. But then and there, in those silent and rayless Catacombs, I was unnerved, overpowered, and horrified, by a crushing dread of the unknown. Every moment was a month. Every feeling was a minister of horror. Exactly what I did I shall never know, though I seem to have a misty recollection that I strove to kill myself by dashing my head against the rocks. For some time I was incapable of determining my conduct ; and then, with all my exquisite sense of mental pain, I was aware of hurrying rapidly through the thick darkness.

How long this continued I know not ; but of a sudden I saw beyond me a flash of light like the aurora in the far northern sky. Was I really mad ? Was I dreaming ? Was I dead, and waking from the sleep of death ? I rubbed my eyes, I pinched myself, I tried to scream, but I could not make a sound. Burning as my throat was, and all on fire as I seemed from head to foot, my voice froze as I sought to give it utterance.

Still, I was not deceived. There *was* a light before me, and as I dashed on involuntarily, I saw that it proceeded from the tapers of my companions, whom I had nearly overtaken. The reaction of my feelings almost prostrated me.

My heart beat like a tilt hammer, my breath was well nigh spent, my pulses leaped with fever, and yet I felt that my face must be blanched, and I should not have been surprised if my hair had turned gray.

In a few seconds I had joined my party and relighted my taper. Nobody knew through what a crisis I had passed, nor did I say anything about it except to remark, casually, that I had extinguished my candle by letting it fall. From inquiries I learned that from the moment I had missed my companions until I had rejoined them, not more than two minutes had elapsed; and still, by the measure of my mind, I had lived through months of pain.

If I had not already known it, I should have been convinced then that time can be reckoned only by feeling; that no clock can keep the record of the heart; and that the soul strikes hours every moment of its existence.

I would advise those who may feel inclined to go through the Catacombs to take a box of wax matches in their pocket, and a little luncheon besides, so that if their taper be blown out, or they be lost, they may at least be relieved from the terror of absolute darkness and immediate starvation. When persons are missed down there, a search is immediately made for them, and nobody would feel half so uncomfortable while he had light and food as he would in the midst of gloom, and haunted by the necessity of dining on himself.

The moist and grave-like odor which fills the Catacombs, added to the images of death on every side, intensifies their sepulchral aspect, and makes those wandering in the ghastly haunts seem to themselves only half alive. The faces of those with me did not appear any more natural than their voices, and all of us had a certain taint of the tomb. Even the tapers flickered and sank in the unwholesome atmosphere, as though even fire, which rages in the centre of the earth, could not support itself in that dusky Golgotha.

In some places the skulls have been arranged in the form of crosses and set into the wall—probably by the priests of Paris, who, like all their tribe, delight in symbols and devices

coupling death and religion ; forgetting that the creed they preach declares there is no death, that true religion leads to eternal life. Monks of all ages — and there are many monks who have never taken orders — have been little more than sacerdotal sextons, revelling in disease and decay, lamentation and funerals, as if Nature had set their spirits to the music of bereavement and woe.

Bones, bones, bones ! Skulls, skulls, skulls ! I can well believe six millions of mortal remains have been deposited in the Catacombs, which look as if they might have been the graveyard of the globe since the dawn of creation. They furnish the most extensive bone-yard I have ever visited. They do not contain nearly so many dead, in all probability, as the Catacombs of Rome ; but on the Seine the dead are exhibited to much more advantage than on the Tiber. The French make the most of everything, and their osseous arrangement and display are not equalled anywhere.

Americans have often been laughed at for their fondness for relics, and very deservedly too ; for they seek mementos in all places, and under every variety of circumstances. I should never have suspected any of my countrymen of a disposition to deprive the Catacombs of any of their horrors ; and yet several of them actually carried off shin and thigh bones in order to recall the pleasure they had experienced in Paris. One fellow — I think he was a medical student from Boston — tried to secure a whole skull ; but as he could not very conveniently get it into his pocket, he was reluctantly forced to leave it behind. Possibly he was an admirer of the first Napoleon, and anxious to obtain a souvenir of Bonaparte. I presume I have met men who, if they were given time and opportunity, would despoil that horrid vault of a very large proportion of its revolting treasures.

During our ramble we encountered a well of pure water enclosed by a wall. In it are a number of gold-fish that manage to live by some mysterious means, though the guide informed us that they did not spawn. The well comes from a spring which some of the workmen discovered while making

repairs many years ago, and gave it the name of the Spring of Forgetfulness, afterwards changed to the Fountain of the Good Samaritan. The water is declared to be sweet; but I should need to be extremely thirsty before drinking what would seem infected with death.

The Roman church, always on the alert to point morals and preach sermons, has filled the Catacombs at convenient intervals with inscriptions designed to be impressive. Some of these are, —

“Happy is he whose hour of death is ever before his eyes!”

“Be not proud or boastful, O mortal; for this is the end of the loftiest ambition and the highest glory!”

“Death recognizes not rank — in his eyes the prince and the peasant are the same!”

“Come, all ye busy worldlings into this silent retreat, and listen to the solemn voice that rises from the tomb!”

“Remember, O man, the mercies of thy God, and remember He will call thee when thou least expectest to hear His voice!”

“The grave is dark; but the paths that lead from it are, to the righteous, strewn with eternal flowers!”

“Mock not the lowly, for in the courts of Heaven the lowly may stand before thee, shorn of thy worldly pride!”

No doubt there is a great deal of truth in these maxims; but in spite of them, and many more like them, death has never been rendered very attractive to persons enjoying good health and a fair degree of prosperity. Death bears about the same relation to life that the Catacombs do to Paris; and I have never yet known any man or woman who would willingly quit the gay Boulevards or the delightful Champs Elysées to walk in the bone-lined and noisome vaults of the subterranean city.

We passed only through the main avenues of the Catacombs, — there is very little variety in them, — and after spending nearly three hours underground, having supped full of material horrors, we reached another staircase, and once more ascended to the light of day, and the blessed sunshine.

I had no idea where we were, and I was somewhat surprised to find that we came out nearly a mile and a half from where we had gone down. The charming capital never, I think, appeared quite so charming as it did on that delicious afternoon when I returned from death and decay to the living and the loving, to the comforts and the joys, of the upper world.

While we were in that vast subterranean graveyard, I was struck by the different effect it produced upon different persons in our party. An Englishman, who was extremely anxious to "do the thing, you know," was superlatively disgusted after he had passed the vestibule, and declared the Catacombs the "beastliest place" he had ever seen. He grumbled like Vesuvius before eruption, and swore that the French authorities ought to be exposed for permitting the subjects of Her Majesty to thrust themselves into such a "bloody" hole. He even suggested that it was a French trick to get rid of certain true and noble Britons, and, of course, threatened to write to the Times on the subject. He was constantly predicting that the rock overhead would tumble down and bury us all, and really seemed uncomfortable because something horrible did not happen. After he had gone half way through, he wanted to go back, and when he had reached the end of the route, he was much dissatisfied that we hadn't done a great deal more. He fretted and fumed every minute of the three hours, and did his best to render every one as nervous and discontented as himself.

Several Americans ran all sorts of saws on the Englishman, and prophesied some terrible calamity at every step, saying they never would have thought of coming into the gloomy region unless they had expected that a fair proportion of the excursionists would be killed. Two of my countrymen insisted that they had made their wills before they had left their hotel, and a third averred that he had a vial of prussic acid and a revolver in his pocket for the express purpose of committing suicide, if he should be lost in the cavernous windings. He asked the Briton if he had not taken the same

precaution, and pronounced him superlatively reckless because he had not, explaining the advantage of self-destruction over a lingering and horrible death. John Bull, remarkable to relate, had not the slightest suspicion that the "Yankees" were poking fun at him. On the contrary, he regarded all their jests as solemnly sincere, and asserted that it was exactly like our nation never to enjoy anything that was not accompanied by a bloody murder of some sort.

A young Italian, who was quite good-looking, and far more conscious of the fact than anybody else, endured martyrdom in the Catacombs from quite another cause. He was very carefully and daintily dressed, and appeared to consider dust or soil upon his clothes as a sovereign evil. He was the dandiest of dandies, and the most fastidious of fools. He looked rather blank, as I had noticed, when we first began the descent of the circular staircase in the Custom House garden. He was in advance, and before we had gone down a dozen steps, I observed a number of large drops falling from the blazing tapers above him upon his new hat and coat. Some kind friend pointed these out to him, and he actually turned pale with wrath and chagrin.

"Who could have done this? Such conduct is disgraceful! I did not come here to have my clothes ruined. I wish the Catacombs were in the bottomless pit." These and other phrases he ejaculated in choice Tuscan, which very few understood, but which those who did understand enjoyed not a little. After the marring of his wardrobe, there could be no pleasure for him. If he had been shown all the wonders of the world, he could not have forgotten his tarnished garments. His misfortunes followed him. The water dropped through the crevices upon his august person, and as he was unusually tall, he crushed his hat every few minutes against the overhanging rock, which struck oaths out of him as steel strikes fire out of flint. I fancied sometimes that he envied the skeletons he passed, because they had no clothes to spoil. Long before he had finished his underground journey, his beauty of person and raiment was sadly injured, and I am

confident that he will remember the Catacombs, and curse them for the harm they did his garments, till the end of his days.

A native of Maine entertained us by inquiring constantly of the guide, who could not speak a word of English, while the New Englander had not the least knowledge of French, in regard to the probable cost of the Catacombs, and whether they paid as an investment. He was very desirous to know, also, whose skull this one might be, and whose that, evidently under the impression that all the monarchs and historic characters of France were buried there. Our guide, too polite not to pretend to comprehend the inquisitive fellow, gabbled away in bewildering generalities. The Maine man asseverated again and again, that he would give five dollars to know what the Frenchman said; and therefore I assumed to tell him. I informed him, though the Catacombs had cost five hundred millions of dollars, that they paid a larger interest than any property in the country; that they were owned by the Rothschilds, who received one hundred dollars from the government for every skull put into the vaults; and that, as there were six millions of them, he could calculate the profits. "By thunder!" he replied; "no wonder those old Jews are so rich. I never knew before how they made all their money. I wonder if a chap couldn't buy a little Catacomb stock."

That mighty charnel-house is not without its tragic history. A number of persons have been lost there in spite of all the precautions against accidents; but these have been very rare of late, because so few persons could obtain admission.

About ten years ago, a newly-married couple arrived in Paris from the provinces, having gone to the city on their bridal tour. It was their first visit to the capital, and they were naturally desirous to see its lions. The bride had heard a great deal of the Catacombs, and would not be satisfied without exploring them, albeit her husband endeavored to dissuade her from such a dismal enterprise. She was bent on going, and so they went together. He kept close to her side, constantly fearing she might be lost. He admitted that he

had a presentiment respecting her, and sure enough it was realized.

They had been in the Catacombs something more than an hour, when, having stopped to examine a curious skull, he called for her to look at it, and discovered, to his horror, that she was missing. There were nearly two hundred in the party, and nobody had observed when or where she had disappeared. They all retraced their steps, entered the adjoining passages, and shouted themselves hoarse to attract her attention; but all in vain. Not the least vestige of her could be discovered. The bridegroom was beside himself with grief, declaring that he knew she would never be found, and calling upon the rocks to fall, and relieve him of his misery. It became necessary to drag him from the sepulchral vault, and when this was done, he proved to be a raving maniac. He was sent to an asylum, where such was the violence of his paroxysms night and day, that he died of exhaustion in less than a fortnight. Diligent search was made for the missing bride, though to no purpose. Not the slightest clew was obtained to her fate, and it was finally conjectured that she must have wandered into some tortuous avenue, and fallen into one of the pits which I have described. Such was the melancholy ending of a honeymoon before it had fairly begun.

Another couple, who had been married a number of years, and who had long lived so inharmoniously that they had gone apart several times, entered the Catacombs in the spring of 1853. The wife was missing when the party came out, — it is always the custom to count the number at the beginning and end of the journey, so as to see that none are lost, — and the husband asserted that he had seen her only a few seconds before. Still, she could not be found on that day or the next; but about a fortnight after, a body answering to her description was discovered in one of the narrow passages into which excursionists are never taken. She had evidently been dead some time, and a deep wound on her temple indicated that she might have perished from violence. Her husband was not

free from suspicion of having murdered her ; but as she might have been so injured by a fall, he was never openly accused of the crime. The story was generally circulated, and the anti-matrimonial jesters of the capital insinuated that more than a thousand unhappy husbands immediately applied for permission to make the subterranean tour with their wives, in the hope that they might be as fortunate as the ungrieving widower.

Walking one day on the Boulevards, my companion pointed out to me a well-dressed man, who had a certain prematurely old look, and whose hair was perfectly white. I was told he was only thirty-five, and that, five years before, he had gone into the Catacombs with a young lady to whom he was engaged, and had hidden himself away from the sepulchral pilgrims for a few minutes, that he might learn how his supposed loss would affect his betrothed. He hid himself so very effectually, that three hours elapsed before he could be found. He had in that time entirely surrendered all hope of release, and the physical changes of years had fallen upon him. He has often described his sensations during those hours, and has represented them as the most terrible he could conceive of. (I can imagine, yes, even understand, what they must have been by my own experience.) The revolution in his mental was as great as the revolution in his physical nature ; and after his distressing sensations, all his freshness and buoyancy of feeling departed. With a strange morbidity, he associated the young lady on whom he had wished to try the sentimental experiment with the agony he had endured, and though she was as wretched as any woman ought to be when he was missed, he broke off his engagement, and refused to see her again after that eventful day. The gentleman may be living still ; for, in spite of appearances, he had an excellent constitution and vigorous health. He was in good circumstances, and went to dine regularly at the *Cafe Anglais*, where he had told his story so often, that he had received the name of "Catacombes" Beaudinet. Nothing remarkable except that had ever happened to him, and as he was a Frenchman, and fond

of prattle, his one adventure filled him, and rendered him a bore of the first water.

As is well known, the French not only have a passion for suicide, but a passion for committing it at certain places, and in certain ways, that seems to be contagious. Forty years ago, a young journalist, while exploring the Catacombs in company with many of his acquaintances, naturally fell to talking on the subject of death, and expressed his opinion that there was nothing awful in it, or even unwelcome. Some of his friends rallied him on this position, and told him he would think very differently if he were conscious that death was near at hand. He stoutly denied that it would change his sentiments in the least, and when nobody appeared to believe him, he suddenly drew a small knife from his pocket, and before any one was aware of his intention, he thrust it into his heart. His suicide, in such a place too, filled his friends with horror, and the press, as he had been a member of the guild, gave detailed accounts of the tragedy, accompanied by strange theories and analyses of the causes that must have led to it. For several weeks, the Paris journals were full of communications on the subject; and they so aroused public attention and curiosity, that in less than six months nearly twenty men stabbed themselves to death in the Catacombs—all of them unquestionably the effect of example.

The Catacombs are the reverse side of the fair picture of Paris. Never since my journey through them have I been able to forget that they lie black and yawning under some of the most beautiful quarters of the capital. When the sunshine is brightest along the Seine, I think of the darkness below. When the city smiles fairest, I recall the millions of grinning skeletons underneath. When the music from the gardens, and the concerts, and the operas sounds sweetest, I fancy mingling among the strains a mournful dirge for the departed and forgotten, so confusedly heaped together in the awful dreariness of the Catacombs.

## XXIV.

### PETROLEUM.

**OIL SPRINGS. — THE FIRE FIELD OF THE CASPIAN. — THE FIRE WORSHIPPERS. —  
— THE RANGOON DISTRICT. — FIRE WELLS OF THE EAST. — PETROLEUM IN  
AMERICA. — ITS DISCOVERY AND HISTORY. — OIL FEVER — ANECDOTES OF  
SPECULATION. — FORTUNES WON AND LOST. — EXTRAVAGANCES OF THE  
NOUVEAU RICHE. — THE STORY OF JOHN. — HOW TO GET UP A PARTY.**

IN various parts of the world there are springs, or natural sources, of inflammable oil. Some of these have been known for thousands of years, but most of them are of recent discovery. The oil which flows from these springs is generally known as "petroleum," the word being of Latin origin, and signifying rock oil. The most productive oil springs are of artificial origin, and are made by boring into the earth, or rock, in certain localities. The most famous natural deposit of this substance, or anything akin to it, on the surface of the earth, is in the Island of Trinidad, in the West Indies, where it forms a lake of asphaltum and petroleum, which is called Tar Lake. This material is a very good substitute for pitch, and is extensively used for coating vessels, and preserving their timber.

A gentleman who has visited this lake says that it is about a mile from the sea-shore, and the distance around it is about a mile and a half. Near the shore the tar is solid, and appears as if it had cooled, when the liquid was boiling, in large bubbles. As one goes from the shore to the middle of the lake, the temperature increases, the matter becomes softer, and in the centre it boils steadily. At a distance, when first seen, it resembles a lake of water; but when one approaches it, it appears like glass. A strong odor of sulphur arises from it, and can be detected at a distance of eight or ten miles. There

(331)

is a bed of coal under the lake. It is of bituminous character, and makes a thick smoke when burning.

The largest supplies of petroleum are obtained in America. Throughout Europe and Asia there are many petroleum wells. One of the most celebrated localities where they are found is the eastern shore of the Caspian Sea. At Baku, on the shores of the Caspian, there are many springs of naphtha and petroleum, and a great many streams of inflammable gases. The abundance of these wells caused the region to be called The Field of Fire; and in the ancient times Baku was known as the Sacred City of the Fire Worshippers. The annual value of this production is about half a million of dollars. About fifteen miles from Baku there is a jet of inflammable gas rising from the rock, and known as the Perpetual Fire. A temple has been built over it, and the fire has been burning for hundreds of years. Pilgrims come from all parts of Asia to visit this sacred well. The place is in charge of a large priesthood, who are supported by the gifts of the devotees.

Another region, quite as wonderful as that of Baku, is the Rangoon district, in India; and a considerable portion of India has been, for thousands of years, supplied by it with rock oil. One authority says, that the number of wells in that district is nearly six hundred, yielding half a million hogsheads of oil annually. Most of the Rangoon wells are artificial, and are sunk in beds of sandy clay, resting on the sandstone, but the wells rarely exceed a hundred feet in depth.

Some parts of Africa are known to contain petroleum springs, and there are many of these springs throughout China and various other regions of the East; Australia and New Zealand claim their share, and it is probable that every country on the globe could, by means of proper borings, be made to yield petroleum.

As before stated, America is the great petroleum-producing country of the world. Rock oil is found in various parts of the American continent, from Hudson's Bay to the Gulf of Mexico, and from the Atlantic to the Pacific Ocean. The most prolific oil region in America is in Western Pennsylvania, and

millions of dollars' worth of petroleum have been obtained there. Thousands of men have made fortunes in petroleum, and a great many have made fortunes in it the wrong way. The early settlers of that region were well aware of the existence of petroleum, having obtained their knowledge of it from the Indians. The Indians used to collect the oil on the shore of Seneca Lake, and it was sold as a medicine, in small quantities, under the name of Seneca Oil. A stream in Alleghany County, New York, was named Oil Creek, on account of the petroleum floating on its surface, and the same name was given to another stream in Venango County, Pennsylvania. On the old maps of that region several localities were marked as affording oil, but it is only within the past twenty years that the oil product has been of any importance.

The substance, as before stated, was used as a medicine, and the inhabitants collected it by spreading blankets on the surface of the stream, and then wringing out the oil which they absorbed. There are indications that the oils were collected long ago, as several deep and very old pits have been discovered. Some people attribute the construction of these pits to the early French settlers, some to the Indians, and some to the predecessors of the Indians. A history of Pennsylvania, published thirty years ago, says that the Indians used the oil to mix with paint in dressing themselves, and refers to an old letter, written by the commander of Fort Duquesne to General Montcalm, describing an assembly of Indians at night on the banks of the creek; and in the midst of their ceremonies they set fire to the oil on the surface of the water. As the flames burst out, the Indians gave wild shouts, which recalled to the writer many of the ceremonies of the ancient fire worshippers at Baku.

The early settlers did not collect great quantities of oil, probably not more than twenty-five or thirty barrels a year. In 1845 operations were being conducted for obtaining salt at a place above Pittsburg, on the Alleghany River. Several springs of petroleum were struck, but the value of the material was not known. In Ohio, fifty years ago, borings were

being made for salt water. An account, published at that time, says, "They have sunk two wells, which are now more than four hundred feet deep. One of them affords very strong and pure water, but not in great quantity. The other discharges such vast quantities of petroleum, or, as it is vulgarly called, Seneca oil, and besides is subject to such tremendous explosions of gas, as to force out all the water, and afford nothing but gas for several days. We make but little or no salt."

This story of the ignorance of the value of petroleum and the disappointment of the salt-makers at finding springs of petroleum instead of salt water, reminds one of the account of the Irishman who complained of his trouble in shooting ducks: "I was not able to fire a shot," said he. "Every time I got sight of a duck another one swam in between him and me, and I could not kill anything."

The first movement for utilizing this vast oil product was made, in 1854, by two New Yorkers, who organized a company, and secured the right to a certain spring on Oil Creek; but they made no progress until three years later, when Messrs. Bowditch and Drake, of New Haven, undertook to search for oil. In the winter of 1858 and '9, Colonel E. S. Drake completed arrangements for boring into the rock below the bed of the creek. On the 26th of August, 1859, oil was found at a depth of seventy-one feet. The drills sank into a cavity in the rock, and the oil rose to the surface. By means of a pump, four hundred gallons were obtained per day, and a larger pump being introduced, the supply reached one thousand gallons daily. This was the beginning of the borings for oil in that region. Every spot where oil was found, or was likely to be found, was carefully examined, and a great many wells were put down. Up and down the banks of Oil Creek derricks were erected and wells were sunk, and in a year or two the banks of the stream looked as if their natural product had been derricks rather than trees. The ground was perforated like a sieve, and if the holes had been a few feet, instead of a few inches, in diameter, it would have

PUMPING WELL ON OIL CREEK.

been dangerous walking round there for fear of tumbling through. The original depth of seventy-one feet was found insufficient, and the borings were frequently conducted to a depth of several hundred feet. I believe one well was sunk over two thousand feet, and a great many wells exceeded a thousand. Many of them never produced oil, and the man who had risked his money to bore these wells saw it vanish without affording anything in return.

A great many stories are told of fortunes made and lost in boring for oil. In some cases men just narrowly missed success, and in others they obtained their success by accident. A story is told of some men who had secured a locality and sunk their drills to a depth of nearly a thousand feet. All their money was gone, and they knew not where to obtain more. There were no indications of oil, their machinery was mortgaged, and the sheriff stood by to secure it. They were about to abandon work; it was near the close of the day, and they had no credit and no means to continue work on the following morning. One of the men proposed to quit about four o'clock in the afternoon. "No," said the other; "let us die game, and put the machine through till sunset."

He tore away a piece of the timber supporting the derrick, and threw it into the furnace to give additional speed to the engine. Just as the sun was beginning to dip behind the western hills, the drill suddenly sunk several feet. It was withdrawn from the rock, and a column of oil mixed with salt water followed it. They had "struck oil," and were saved.

In another instance a company was formed, and had drilled a dozen wells, but without success. Their capital was nearly gone, and they were working on a well which, if unsuccessful, would prove their ruin. Just as they had expended almost their last dollar, and were within twenty-four hours of suspending, they found oil in abundant quantities, and were saved from ruin.

There are many instances of men searching for oil, boring their wells to a considerable depth, and abandoning them in

consequence of the exhaustion of their money, and the discouraging prospects. After abandoning their work, others took possession of the places, and in a few days, sometimes in a few hours, opened wells of great value.

In the oil regions I was once told a story of two men who had been at work a long time, but could get no oil. Their money was exhausted, and they became discouraged. When they had expended their last dollar, and mortgaged everything, they stepped aside and made way for their creditors. As they surrendered their machinery, one of them said, —

“Let us clear out of this place, and go to work by the day until we can get enough to try it again.”

“Hold on,” said the other; “let us sit down and see these fellows work. We will stay a little while, and see if they get along as fast as we did.”

So the two men remained, mainly for the reason they did not know what else to do.

The new comers drilled away at the well, which was already several hundred feet deep, and in half an hour after they began working they found oil. When the tools were withdrawn, the well began flowing a hundred or more barrels per day. Imagine the disgust of the former owners!

It was the same in the oil regions with regard to disappointments that it has been in California and other countries containing mineral treasures. A case like the one just described is almost an exact parallel of a case in California, where two men, working a week or more on a claim where they hardly made money enough to pay their expenses, abandoned it in disgust. Two others stepped in, and on the very day they took possession, found a lump of gold worth several thousands of dollars. In another instance some Americans abandoned a claim, which was immediately occupied by half a dozen Chinese. The Chinese found a rich deposit of gold within six inches of where one of the Americans had abandoned the use of his pick and shovel.

Petroleum wells can be “salted” or “baited,” just as gold or other mines can be salted, and in the early days of the oil

fever, the baiting of petroleum wells was by no means an uncommon thing. Sometimes it would be done by one of the owners of a well in order to defraud other owners. For instance, Smith and Brown have entered into partnership to put down a well. They join their money together, buy the necessary drills and machinery, and go to work. The well is down one or two hundred feet. Smith gets tired of it. He knows that Brown has more money, and so thinks that he will sell out. While Brown is asleep, Smith gets a barrel or so of petroleum, and pours it into the well. Next morning, when they go to work, the condition of the hole is tested as usual, and of course there are indications of petroleum. If a barrel has been poured into the hole it is filled for quite a long distance. Smith has taken care to be away at the time, and appears in perfect ignorance. If Brown is honest he will tell Smith, on his reappearance, of the rich supply they have found; but the chances are two to one that Brown will say nothing, except to suggest carelessly that the well is not very promising, and ask Smith what he will give for his share. Smith says, with equal carelessness, "I don't want to buy, but I will sell my interest for three thousand dollars."

Perhaps he puts it at a higher figure. He knows the length of Brown's purse, and goes for its contents. The result is, that Brown secretly chuckles over his speculation, and buys the well.

Smith goes on his way rejoicing, and Brown, still more rejoicing, stays where he is. He knows that a few inches more of depth to the well will yield abundant oil, and he works away very earnestly; but somehow he keeps on drilling for a long time, and at last awakens to the consciousness that he has been sold.

A great many petroleum wells have been salted and sold in this way, but it sometimes happens that the would-be swindler gets the worst of his bargain. I knew one case, in 1863, where a man baited a well in the above way, and sold it. He laughed that evening over his sharp trick; but he laughed less the next morning, when he passed the well and saw that the

tools had been withdrawn, and the well was flowing at the rate of three hundred barrels a day. A few hours after the purchasers entered upon their work, they struck oil and were happy.

A trick that has been practised in the oil regions to some extent is to convert a well which has no oil in it into a genuine flowing well. I have known this to be done by conducting a pipe underground from a tank at a genuine well a few hundred yards away. The pipe opens into the baited well, and it can readily be seen that with a good "head" on the pipe the well will be a perfect flowing well, to all intents and purposes. Men are engaged in barrelling the substance, and a visitor can see with his own eyes the amount of the yield. If he wants to buy a well, nobody has any great desire to sell, and he may have difficulty in buying the whole thing outright; but he can get an interest in it for a comparatively low figure. Sometimes he may buy one man's interest, and then another man's, and he thinks he has struck a very fine bargain. But during the night, after his purchase, the oil ceases flowing, and he finds that his property is worthless.

Another swindle of the same sort is to have a tank filled with oil, and a pipe run through one of its supporting posts, and under ground into the well. The pumping machinery is kept at work, and it may be pumping, say, at the rate of one hundred barrels a day. But all the time that the pump is working, the oil is running into the well, and it may run in and be pumped out again and again. The operation is a simple one, and well calculated to deceive.

A great many petroleum companies were organized at one time, which had no existence beyond the paper one that they had in New York and other cities. Some of these companies gave most brilliant promises. I remember one which printed a flaming prospectus, and announced that there was room on its territory for three thousand first-class wells. No one could doubt the truth of this assertion, but its territory happened to be on the top of a mountain, where three hundred thousand wells might have been sunk without finding a

drop of oil. The projectors of this concern sold a great deal of stock, but I believe they never declared a dividend of a single dollar, or even took the trouble to sink a well. Their money was made by defrauding their patrons rather than by doing any work in an honest way. Millions of dollars were sunk in oil speculations whose investors never obtained any return whatever. The public heard of the wells that yielded enormously, but they never heard of the thousands of wells that never amounted to anything.

So great was the rage for oil speculation during the height of the fever, that a well would be sunk where there was the least chance or prospect of obtaining oil. Suppose a man found a spring of pure water; he might pour a gallon or so of oil on the surface, and then carelessly, and with apparent innocence, lead a stranger to the vicinity. The stranger soon smells the oil, examines the water, and buys the spring at a high price.

One day a farmer broke a kerosene lamp in his cellar. A few hours later he admitted a stranger who wanted to buy some potatoes. The stranger discovered the oil, forgot about the potatoes, and immediately opened negotiations for buying the house and the land on which it stood. He paid about three times as much as they were worth, and the farmer went away happy.

A man, who thought crude petroleum a good remedy for freckles, one day bathed his face in that article, and lay down to sleep. As he tells the story, he was waked in half an hour by a New York speculator who was trying to sink a shaft into his ear.

A story is told in California of a man owning a farm which he wanted to sell. He had heard of the petroleum dodge, and thought he would try the same plan in another way. So one day, when a lot of speculators from San Francisco were at his house, he poured a gallon of whiskey into a small spring, and then led the speculators in that direction. The farmer spoke of the spring, said that he made no use of it, as he had an abundance of water near his house. He had never observed

the spring except to remark its peculiar color. He roused the curiosity of the strangers so that one of them tasted the water, winked at his neighbor, and stepped aside. Before night the farmer had sold his place at a high price, and the speculators had organized a company for supplying the California market with an excellent article of whiskey cocktail. But somehow their enterprise never succeeded.

The immense fortunes made from petroleum speculations were almost marvellous; a man might be poor to-day and worth a million dollars to-morrow. In the morning he could not raise enough money to buy a breakfast, and at noon his credit would be good for the purchase of a first-class steamship. A man might be working as a day laborer this week, and his wife would be taking in washing at a dollar a dozen. Six days later he would be a millionaire clad in broadcloth and fine linen, and wearing a diamond like a calcium light, while his wife would be arrayed in silks of the most costly character, and wearing them as uneasily as a bull-dog wears a pair of trousers tied around his neck.

A good story is told of a woman one day selecting some diamonds in a jewelry store on Broadway. Two other women were standing near and observing her motions. One of them suggested to her friend, "Evidently shoddy."

The diamond purchaser raised her eyes for a minute, and said, "No, madam; petroleum."

A great many stories are told of a youth in the oil regions who was brought up on a farm, and who, for a year or more, after the outbreak of the oil fever, was driving a team at fifteen dollars a month. He had a grandmother, as most young men have, but she was unlike a great many grandmothers, as she was enormously rich. She owned a large farm, and leased it to speculators who wished to search for oil. She always stipulated for half the oil, and her farm was so productive that she had a magnificent income, and accumulated money at a very rapid rate. A common report was, that she had eleven barrels and four trunks full of greenbacks.

One day she did as all good grandmothers do,—she died.

The youth, whom I will call John, as that was half his name, became heir to her vast estate. He dropped into two millions of cash, and into the farm, which yielded about two thousand dollars a day. He had never had so much money before in all his life. Ox-driving at the compensation he received would require a long time for the accumulation of such a fortune.

He thought the matter over, and determined to have a good time. He engaged several youths of his acquaintance to assist him in wasting his substance in riotous living. The party went first to Cleveland. At the railway station they had some dispute about a carriage, and so John bought a carriage to take them to their hotel. When he reached the hotel he concluded that that was not the kind of carriage he wanted, and so gave it away. He secured all the best rooms in the house, ordered the best supper the proprietor could furnish, and the party went to bed on the floor as drunk as a quartette of badgers. They rose the next morning with very large heads on their shoulders, and were occupied during the forenoon in removing their Mansard roofs by means of soda water and cocktails.

John sent for the best team in Cleveland, and obtained a four-horse one, with a carriage gorgeous enough for a third-rate emperor. He picked out one of the drivers round the front of the hotel, told him they were going to stay in Cleveland a few days, and if this driver would take the team and drive them round during their stay, he should have the whole concern, at their departure, for his trouble.

John next proposed to charter a grog-shop, and another institution which shall be nameless, for the exclusive use of himself and friends during their stay. They made things lively for a few days, and then left for Philadelphia by way of Buffalo.

They stopped at Niagara Falls, and proposed hiring a boat-load of people to be sent over the falls for their amusement; but, somehow, they could not find anybody willing to make the jump. John wanted to buy the Falls and run them as a

private show, but he changed his mind and continued his journey.

In Philadelphia, and subsequently in New York, the party was guilty of various extravagances, and sometimes displayed absolute ingenuity in getting rid of their money. On one occasion they treated a party of fifty or more street laborers to champagne, filling each of them up to his chin, and sending them home blind drunk. They bought horses and carriages to give away next day. They chartered hotels and other public resorts for their exclusive occupation. They used to give away ten-dollar bills, and sometimes hundred-dollar bills, as gratuities to servants.

John seemed to be troubled to know what to do with his money, and it gave him more anxiety than he was ever blessed with during the days of his ox-driving experience. I believe he died after a year or so of this new life. It was too much for him; he could endure poverty, but he could not enjoy or endure such an accumulation of wealth.

There was a case similar to his of a young man growing suddenly rich through petroleum, who started on a riotous career, and managed to get heavily in debt. The wells gave out, and left him without money, and no prospect of obtaining any. In a year from the time of his becoming so suddenly wealthy, he was at work again as a day laborer, and meditating upon the uncertainties of life in the oil regions.

On one occasion an oil speculator came to New York with fifty thousand dollars or more in cash, and claiming that he had a flowing well yielding two hundred barrels a day. In less than a fortnight he had gambled away his money, sold his wells, and the last I saw of him he was on his way to the station-house for default of paying the amount of his hotel bill. He was kept there a short time, and then released. I believe the hotel never received anything from him.

A great many extravagances have been committed by the petroleum aristocracy. Persons suddenly raised from poverty to affluence are nearly always anxious to effect an entrance into society. They take fine houses, and sometimes they

manage to get people of repute to visit them, though not often.

Three or four years ago a family that had suddenly grown rich determined to give a party that should introduce them to society. They made preparations, and sent out a great many cards of invitation. They ignored their former acquaintances altogether. They selected the names of their guests from the City Directory, taking those that were prominent in the social world. They even pretended to an aristocratic descent, and I believe their card of invitation bore a crest of some sort or other.

The evening of the entertainment came. Madame, almost smothered in silks, with a large amount of store hair, and decked with diamonds enough to set up a jewelry store, was all ready to receive her guests. The daughters were in their best, and expected to make a dozen conquests apiece in the course of the evening. A magnificent supper had been prepared, and a troupe of servants were awaiting the commencement of their duties. Eight o'clock was the hour fixed for the party.

At eight o'clock there was not a guest in the house. "Surely," said Madame, "they will be here very soon." Half past eight o'clock came. Nobody. Nine o'clock. Nobody. Half past nine. Nobody; and then ten o'clock, and still Nobody. It was then the great truth stood revealed that the party was a failure.

The servants, who had been standing about with their tongues in their cheeks, were commissioned to eat what they could of the gorgeous banquet, and the aspirants to social honors smothered their sorrow, and made no more attempts, for that season at least, to get into society.

## XXV.

### WINE AND BEER CELLARS.

WINE CELLARS. — HOW THEY ARE MADE. — PLACES FOR STORING BEER. — THEIR EXTENT. — THE GREATEST WINE CASK IN THE WORLD. — ITS CAPACITY. — PECULIARITIES OF WINE AND BEER VAULTS. — VISITING A CELLAR IN POLAND. — CURIOUS SIGHTS. — THE ANTIQUITY OF THE BOTTLES. — WHAT A VISITOR DID. — THE RESULT OF TOO MUCH WINE. — A DANGEROUS BRIDGE.

A GERMAN resident of New York, engaged in the manufacture of beer, visited the excavations at Hallett's Point, near the upper end of Manhattan Island, and, on viewing the large space which had been dug out of the solid rock, exclaimed, "What a capital place for storing lager beer." Many a wine and beer manufacturer has made the same remark on visiting the Mammoth Cave, or other huge caverns. The best places for storing malt or vinous liquors are under ground, for the reason that an equal temperature can be maintained at all times; summer's heat and winter's cold make but very little change of the thermometer in the depths of the earth.

In various parts of the world, particularly in Europe, there are vast underground spaces specially designed for the storage of wine, beer, and similar beverages. Nearly all these articles require to be kept some time before they are fit for use; especially is this the case with wines, some of which improve steadily during a year, or for ten, or twenty, fifty, or it may be for a hundred, or five hundred years. Some of the wine cellars of Europe have been hewn out of the solid rock, or dug out of the solid earth, at vast expense, for the simple purpose of storage. Other wine cellars were, originally, quarries, or mines; and after they had been abandoned by the miners, they were taken up by the wine and beer manufacturers, and adapted to their present uses. The same is

the case in America. Reference is made elsewhere to the cellars of Dubuque, Iowa, which are nothing more nor less than exhausted lead mines. At several places on the Mississippi and Missouri Rivers there are cellars which originally were quarries or mines. Their natural treasures were taken from them, and they are now filled with artificial ones.

In California, particularly in the Sonoma Valley, are some wine cellars which have been dug out of the rock for no other purpose than for that of storage. Some years ago I visited one of these establishments with a small party, and the proprietor, in order to give us an idea of the temperature, shut us up a little while, and left us to ourselves. The place was not cold, but it was cool compared with the outer atmosphere, and we very soon began to sneeze. Had we been kept there for any length of time, I suspect that we would have had sore throats and all that sort of thing; but they were prevented by the select assortment of liquids which the wine manufacturer supplied to us with such liberality that some of his visitors' legs became very much entangled, and refused to perform the duty usually required of them.

All through Europe, and particularly in France and Germany, there are cellars of great extent. The wine makers of France and Germany are able to store away thousands of casks, and other thousands of bottles, every year without any difficulty. The same is the case with the beer makers of North and South Germany, particularly in the vicinity of Munich and Vienna. There is one wine cellar on the Moselle, which is said to be capable of containing a million bottles and twenty or thirty thousand casks of wine at one time, and I have heard of one wine cellar even larger than this. The capacity of the beer vaults of Munich is, I think, greater than that of the German and French wine vaults. It is certain that a storage capacity sufficient to supply the annual consumption of beer in Munich, Vienna, or Berlin, must approach the dimensions of a small city. It is well known that the average German can get outside of a great quantity of beer in the course of twelve months. As an illustration, I may mention

that the day before writing this paragraph I was told of a strike among some German laborers in an establishment near New York. Their strike was not for wages, but for beer. They were satisfied with the pay they received, but not with the quantity of beer furnished to them. Their employer allowed them two five-gallon kegs daily for every three men, and in their strike they demanded a daily keg of beer per man. They said that two thirds of a five-gallon keg were not sufficient, but they would manage to get along with five gallons each per day. The employer agreed with them, and they resumed work as soon as he consented to their demand.

It is on record that one individual German drank one hundred and fifty glasses of beer per day, and I believe there was an instance in Cincinnati, a few years ago, where a German consumed, on a wager, one hundred and eighty-eight glasses between sunrise and sunset of a summer's day. It is not fair to take these ambulatory beer casks as an indication of the drinking abilities of the Teutons, but it may safely be assumed that an ordinary community of Germans can get outside of an average of twenty glasses a day per man without feeling it.

It is not my province to describe the process of making beer or wine, as the work is mainly performed above ground, but simply to allude to the space where these beverages are stored. I have visited a fair proportion of them in various parts of the world, and they are all pretty much alike. They are simply large vaults or caves, sometimes arched over to prevent the falling in of the earth, while in other cases they are cut out of the solid rock, and require no arching. Sometimes a wine cellar will consist of a single vault, with regular pillars or arches sustaining its roof, while in other cases there will be a great many galleries, or tunnels, running off in different directions. Sometimes the casks containing the wine or beer will be of a size that will permit of their being rolled about, while in other cases the casks or tuns will be so large that they always remain stationary, and are filled and emptied without being moved from their places. An example of this is the celebrated tun of Heidelberg, constructed in 1751,

and capable of containing forty-nine thousand gallons. It has been filled but two or three times since its construction, and the process of filling occupied on each occasion two or three weeks. It is sufficiently large to allow the erection of a ball-room upon it, and several festivals and dances have been held there. It is the largest cask which has ever been made, or probably ever will be made.

The preparation and preservation of wine require great care, and, above all things, an even temperature. Many a cask of wine has been spoiled by being kept too hot or too cold; and this is one reason why the preference is shown by wine makers for underground places of storage. Apart from this fact is the saving that can be made by utilizing the space under the earth where the surface is of great value.

As before stated, a visit to one wine cellar is very much like a visit to another. The stranger is led or guided among rows of casks and bottles, and sometimes his underground journey will amount to a mile, or two or three miles, of linear distance. He wonders how the demand can be so great for this material, just as a countryman wonders, as he walks through the market of a large city, how all the beef, pork, and mutton can find purchasers. He may go through a market and think the supply exceeds the demand, just as when he walks the streets for an hour or two, and sees the crowds of people, he will wonder where all this mass of humanity can find sufficient food. In the same way a person unfamiliar with the business may have alternate surprises about the supply and consumption of wine.

One of the first wine cellars which I visited in Europe was in the famous city of Warsaw, Poland. I had entered Europe by the back door, as it were, coming from Asia over the Ural Mountains; and consequently the first ancient city I found where there was any wine trade of significance was Warsaw. A travelling friend and myself were under the guidance of an officer serving on the staff of the governor of Poland, and while pointing out the curiosities of the city, he suggested taking us to one of the oldest wine cellars in

Europe. I think he said there were a few, but only a few, which had greater antiquity.

Our party was small, — only three of us altogether, — and we drove in a single carriage to a very unattractive place in the Jews' quarter of Warsaw. We entered a narrow and rickety-looking building, which gave no promise of the wealth stored away beneath it. The officer was acquainted with the proprietor of the place, so that we easily obtained permission and escort for our underground journey. The proprietor himself took charge of us, and was accompanied by a servant to assist in showing us round, and possibly to see that we did not stow away in our pockets any of the valuable bottles in the cellar.

We descended a narrow stairway, so narrow, in fact, that we went singly, and so low that we were obliged to stoop to avoid hitting our heads. The place was hewn out of the rock on which Warsaw is built, and it was arched over to sustain the weight resting upon it. Reaching the floor of the cellar, we were first led between rows of casks, and the ages of the casks were stated as we walked among them. One was pointed out that had been in the cellar thirty years, and another that had been there two or three times as long. They were covered with dust and cobwebs, and looked as if good for a much longer stay. Over our heads we could hear the rumbling of carriages in the streets, just as one can hear the carriages in exploring the ruins of Herculaneum.

Cask after cask was pointed out, until our eyes were wearied, and we were then taken to the old cellar where the bottles were stored.

Our guide explained that the cellar we had just visited was a modern one, only two hundred and sixty years old. The old cellar, he said, was made in the days when Poland was a kingdom, and more powerful by far than the now great Muscovite empire. I do not remember positively the age he gave it, but I think it was some nine hundred or a thousand years old. I was too busy looking among the bottles to take particular notice of what he said, and am not willing to trust

too much to my memory, especially on the occasion of visiting a cellar like this. The real interest of the place began when we entered the locality where the bottles were stored. Here were little shelves — I say little, though many of them were three or four feet wide — covered with bottles, some standing upright, while others were carefully packed away. There was one shelf where the bottles had been lying undisturbed for twenty years; another where they had not been touched for thirty, another for forty, and another for fifty years. Above most of the shelves a date was chiselled into the rock, and the date, as I was told, indicated the time when the wine was bottled and placed there. These chiselled places were, however, comparatively few, as the most common designation was that of a date cut in a small piece of board which rested above the bottles.

In some places the dust of ages had almost obliterated the dates, but our guide seemed to know them all from recollection. I remember one date of 1750, another of 1634, and I believe there was one board dated somewhere about 1590. Shelves were pointed out which were said to contain wine that had not been moved or disturbed in any way for three hundred years. I do not vouch for the truth of the statement, but merely give it as I heard it.

It was interesting to observe how the dust and cobwebs had gathered about the bottles, and also to observe the shapes of the bottles. The more recent shapes were those familiar to all drinkers and friends of drinkers of the present day. Then there were short, thick-set bottles, while others were dumpy and very long in the neck, reminding one of an over-fed goose or a camel suffering with the dropsy. Some of the earlier bottles indicated that the art of blowing glass was not well known at the time of their construction, as they were badly shaped, and frequently had deep indentations in their sides. Some of them could be called flasks, rather than bottles, as they had no necks at all, and were round at both ends. All the bottles that I examined were carefully sealed, and I was shown several bottles with long, tapering necks,

that had been tightly closed by melting their ends in a flame after the wine had been placed inside, just as the tube of a thermometer is closed after it has been filled with quicksilver or alcohol. In order to get at the wine enclosed in this way, it is necessary to break away the top of the neck.

The cellar was perfectly dry, so that no moisture collected anywhere. I may remark, by the way, that a dry cellar is always desirable. There was no moisture, but there was a liberal supply of dust and cobwebs. On bottles that had been in their places only a few years, there would be a slight film or covering of dust. Those that could boast of twenty years, and those that had remained undisturbed a hundred or two hundred years, were covered so thickly that it was almost impossible to distinguish the bottles from the mass which covered them. I saw one shelf—I forget its age—where not a bottle was visible; it seemed to be a mass of cobwebs, and nothing more. To judge from its appearance, I would not have given twenty-five cents for the contents of that shelf; but if I had offered twenty-five hundred dollars, my offer would have been spurned with disdain. I asked the value of the wine on this shelf, and was told that it was twenty guineas a bottle. I did not want any of it at that price, but I presume that there are plenty of men in the world who are ready to pay it.

After we had seen the curiosities of the place, the proprietor insisted that we should make a practical test of his wine. He did not open any of the twenty-guinea stuff, and we could not expect him to, though I secretly hoped he would consider himself sufficiently honored by our presence to do the handsome thing, and break a bottle or two of it just to give us a taste. The best he would do was to open a ten-guinea bottle from another shelf. It is not every day you can smack your lips over wine worth fifty dollars in gold a bottle, and we sipped it very carefully, and allowed it to trickle not too rapidly down our throats. I found it a very agreeable wine; it had a rich and fruity, though rather sweetish taste. I know nothing to which it can be compared, and therefore I will not make any comparison.

The proprietor treated us on the descending scale, for the next bottle he brought us was a five-guinea one. It was only forty or fifty years old, a very juvenile stuff, but we were unable to discover any great difference between it and the other. Two or three kinds of this wine were shown us, and then he brought all sorts of new wines just in the cellar, that is to say, they had only been there some five or ten, or it may be twenty years. Other wines were brought forward for our deglutition; and after a time the thing became a little monotonous, and I suspected that we might get our heads and feet a little tangled. I suggested that we had other business to attend to, and had better not indulge in the wine business any longer; but the proprietor was polite, and was constantly offering us just one more sample.

"Have the gentlemen taste this one," he would say to the officer who accompanied us, and at the urgent request of the officer we would indulge the proprietor.

The officer repeatedly stated, on presenting the wine, that that would be the last; but somehow there was always something new to be tasted, and something that we could not decline without giving offence. Before we got through, we tasted nearly every wine in the cellar, and finally asked to be let off.

When we reached the foot of the stairway, we found it had shrunk greatly in size. We had descended without difficulty, but now it was necessary to move up edgewise, and I firmly believe, that if we had remained below much longer, the shrinking process would have made the staircase so narrow, and the roof above so low, that we should have been unable to get out, and might have staid there forever. Think of one's terrible fate in being shut up in a wine cellar to die.

My companion wanted to sit down on the foot of the stairs and go to sleep, but I told him it was not a custom in Poland on visiting wine cellars, or, so far as I know, in any other country. He then asked me to write to his friends, if I succeeded in getting out, and tell them to send money enough to buy out the concern to take it home to America.

He would take cellar and all if he had to carry the whole city of Warsaw and the Ex-King of Poland in his trunk. He had a friend at New York who would just like this sort of thing. He would be willing to sell all his interest in the United States if he could only assemble his friends in that cellar, and get them as blind drunk as he was. I saw that he was wandering mentally, although unable to wander much physically, owing to the extreme suppleness of his legs. He began to chide me for taking so much wine, and said I ought to have followed his example, and drank nothing.

The situation became alarming. There was the staircase growing narrower until it resembled a loophole in the wall of a fortress. I was very much inclined to sit down with my friend, and wait until the place grew larger. While thinking what to do, we were roused by the appeal of our officer comrade to taste of another wine, a very superior article from Hungary. We told him politely that we must refuse, intimated that we should feel much better without it, and if he could only plan some way by which we could get out of that cellar and reach our hotel, we should be very much obliged.

He led the way up stairs. We observed that luckily they were large enough for him to ascend without difficulty, and finally we reached the space above. Once there we breathed more easily. We thanked our host for the attention he had shown us; we thanked him by shaking his hand, and keeping our mouths closed. To thank him in English would do no good, as he did not understand our language, and we were a little doubtful of our ability to pronounce our words correctly. I am sorry that my friend made so free with this ancient wine, as it totally incapacitated him from saying a word in Polish or any other language with which he was not familiar.

When we reached the open air we found that our heads became level again, and in a little while the effect of our wine-sampling excursion had passed away. Assuming the dignity of a couple of emperors, we rode to our hotel, took a lunch, and felt better.

All over the world it is a trick of the proprietors of wine cellars to put their visitors through the system of sampling, so that, drink as sparingly as they may, — a teaspoonful at a time only, — they will be very much confused in body and mind before they emerge from the clutches of their entertainers.

In one of the Western States I am acquainted with a wine dealer whose cellar is entered by crossing a narrow bridge over a brook. The bridge is ten or twelve feet long, about three feet wide, and has no railing. I have heard him say that no visitor to his wine vaults ever yet walked that plank on his return from the cellar without tumbling into the brook. From what I have heard of his establishment, I think he is not very far from the truth. Many a visitor to that cellar has received an involuntary plunge bath as he came out into the open air.

## XXVI.

### THE BASTILE.

ITS HISTORY AND CONSTRUCTION. — THREE AMERICANS SEARCHING FOR IT. — A FRENCH JOKE AT THEIR EXPENSE. — HOW PRISONERS WERE RECEIVED AND TREATED. — HORRIBLE DUNGEONS. — THE OUBLIETTES. — CRUELITIES OF THE BASTILE. — THE MAN IN THE IRON MASK. — HIS ROMANTIC STORY. — DESTRUCTION OF THE BASTILE.

ONE of the most famous dungeons or prisons in the world was the Bastile of Paris.

It was a state prison and citadel of the city, was built in the year 1369, and destroyed by the mob in the beginning of the revolution of 1789, or more than four centuries after its construction.

It is a curious fact that no plan of the Bastile as originally constructed is in existence, neither is there any plan extant of the Bastile as it appeared at the time of its destruction. Somehow the kings of France were averse to giving the public much information about this famous prison of state. They appear to have been satisfied with the knowledge that the place existed, and that those who displeased them could be shut up there, and they never troubled themselves to know the exact plan or model of the concern.

There has been a great deal of exaggeration concerning the Bastile, and many stories have been told about it which had little or no foundation. After all, there was really no need of exaggeration, for the atrocities committed within the walls of the Bastile are quite horrible enough for all practical purposes.

In ordinary life the French are a quiet, harmless people, and they are the last in the world whom you would suspect of

THE GRAND HOTEL.

atrocities ; but every revolution in France has been full of horror, whether in past times or in the present. It has been said that you may take the mildest Frenchman in the world, give him a place of authority where his acts will not be called into question, and the chances are great that he will conduct himself in a very savage manner. I do not assert this of my own knowledge, but leave the reader to judge whether the history of the French prisons and French tyranny does not, in some degree at least, corroborate the statement.

The day after my arrival in Paris, a friend proposed that we should visit the Bastile. We were talking upon some topic, and I had actually stepped inside the carriage with him and given the order to the driver before it occurred to me that the Bastile did not exist, and had not existed for several scores of years. When I remembered this, and told my companion, he said, —

“I came very near selling you. I want to get even on selling myself.”

Then he told me a story of his experience in searching for the Bastile. Bear in mind that he was an editor, familiar with history (editors of course know everything), and if he had given the subject a moment's thought it would have occurred to him that there was no Bastile in Paris worth mentioning. Let me tell his story as he told it.

“There were three of us who came over in the steamer, landed at Brest, and came to Paris. We arrived here in the evening. We put up at the Grand Hotel, and the next morning started out to ‘do’ the city. The first thing we saw as we stepped out of the hotel door to the Boulevard was an omnibus, on which was the sign ‘*Place de la Bastille.*’ We mounted to the top of this omnibus, and away we rode down the Boulevard.

“By and by we stopped near a large, open square, with a monument in the centre. The conductor motioned us to get off, and said something which we did not understand, but took to mean that this was the end of his route. Moreover, the omnibus turned round, and we understood pretty well

that we must get ashore. I was the only one who could speak French, and I couldn't speak much of it. As we left the omnibus, I said to the conductor, '*Monsieur, où est la Bastille ?*'

"The conductor stared at us, smiled, and turned away. Then we stepped on the sidewalk and looked around. Close by us was a '*Restaurant de la Bastille*,' and on the corner we could see the sign of '*Place de la Bastille*.' There was a cake shop close by, and that had a sign which indicated that it was the cake shop '*de la Bastille*.'

"Then we stopped a well-dressed Frenchman, and said to him, '*Monsieur, où est la Bastille ?*' The fellow was too polite to laugh in our faces, as the conductor did, but he said not a word, and walked off. I saw, though, when his back was turned towards us, that he was shaking his sides, and evidently grinning.

"Then we stepped into the restaurant, and I said to a waiter, '*Guyon, où est la Bastille ?*' and that infernal waiter laughed in my face. I said to the other boys, 'These confounded Frenchmen round the Bastille are all fools. I thought Frenchmen were polite, but these fellows have no politeness at all.' We climbed out of that restaurant, and went out on the square on a Bastille hunt.

"There was no more sign of a prison than there is inside your boot. We walked round that square about ten minutes, when it got into one of our heads,—not into mine though,—that the Bastille had been destroyed in 1789. I had nothing more to say, except that we were the three biggest fools in all Paris. Here we had been hunting round, boring everybody, and asking them to show us a prison which was destroyed eighty years before, as we perfectly well knew, only we did not happen to recollect it. We went back to the Grand Hotel, and the next time we went out sight-seeing we made sure that the thing we inquired for was in existence."

The Bastille was an irregular building in shape, as the original construction, in the time of Charles V. had been added to by each successive monarch. It had as its princi-

pal feature eight round towers, connected by curtains of masonry, and was encircled by a ditch a hundred and twenty-five feet wide. This ditch was generally dry, and was surrounded on its outside by a wall sixty feet high, to which was attached a wooden gallery running round the whole inner circumference of the ditch opposite the castle. This gallery was called the "Rounds." Sentinels were stationed on these Rounds, and it was their duty to be perpetually in motion, in order to discover any movement of the prisoners for escaping. The Bastile had a governor and a staff of assistants, and it had a garrison of one hundred men, with their proper officers.

Whenever a prisoner was brought to the Bastile, his trunks and clothing were carefully examined, in order to discover whether he had any concealed papers or weapons. The advocate Linguet, who had been detained there for three years, says, —

"The new comer is as much surprised as alarmed to find himself subjected to a personal examination by four men, whose appearance seems to belie their functions; men clad in uniforms, which leads one to look for a regard to decencies, and wearing decorations which presuppose a service which endures no stain. This man takes from him his money, that he may have no means of corrupting any one of their number, his jewelry on the same consideration, his papers for fear he should find any resource against the tedium to which he is henceforth devoted, and his knives and scissors are taken from him for fear he should commit suicide or assassinate his jailers."

After this examination he was led to the cell intended for him to occupy. These cells were situated in all the towers. The walls were at least twelve feet in thickness at the top, and at the base they were thirty or forty feet. Each cell had a small window defended by three iron gratings, one within, the second without, and the third in the middle thickness of the masonry.

The bars of this grating were an inch thick. No fire was

allowed, and there was no glass in the windows, so that in winter these cells were like ice-houses, and in summer they were hot and damp.

The dungeons were nineteen feet below the level of the court-yard, and five below that of the ditch. They had no openings but a narrow loophole communicating with the ditch. The inhabitant of these dungeons was deprived of air and daylight, and lived in a damp and infected atmosphere. Oftentimes the floor of his cell was covered with mud, and he found himself surrounded by reptiles, rats, and other disagreeable creeping or walking things.

The written history of the Bastille shows that these horrible cells were frequently used for the confinement of prisoners in order to make their existence as terrible as possible. There is a tradition that iron cages were used for the confinement of prisoners, but writers who have given their attention to this subject say that nothing of the sort was discovered at the time the Bastille was destroyed. There is also a tradition in regard to the *Oubliettes*, which are described as holes into which condemned prisoners were lowered, where they should languish and die forgotten. There is also a tradition in regard to a Question Chamber, in which suspected prisoners were tortured to make them confess their guilt, or to reveal the names of their accomplices.

The Bastille could contain fifty state prisoners in solitary cells, and by putting two persons in one cell the number could be raised to a hundred. Sometimes as many as three hundred persons were in the Bastille at once, and in that case they were densely crowded. According to history the prisoners were wretchedly fed, but it should be said, in justice to the government, that this state of affairs was probably due to the frauds of the subordinates rather than to any intended cruelty on the part of the government, as the latter generally made liberal allowances for the support of the prisoners of state. One writer asserts that in his time the governor of the Bastille had a great number of prisoners, many of whom were paid for at twenty-five francs a day, and that their

**PLACE DE LA BASTILLE.**

**THE BASTILLE.**

subsistence did not cost as many sous. There was a regular tariff for expenses for the table, lights, and washing of all prisoners, according to their rank. A prince was allowed fifty francs a day, a marshal of France thirty-six francs, a lieutenant general thirty-four francs, and so on down to the inferior prisoners, who were allowed two francs and a half.

A prisoner might be examined at the moment of his arrest, or not until weeks, months, or years afterwards. He had no mode of offering any defence, or of telling his friends where he was, or why he was detained; and sometimes he did not himself know these facts. He was allowed no books or papers; he could not communicate with anybody except by special permission. He could not be visited except on an order from the lieutenant of police, and at such visits all the conversation must be in the presence of an officer of the prison, and no allusion could be made to the cause of detention, the term of imprisonment, or any topic of that sort.

The treatment of prisoners varied greatly. Some, whom it was desired to kill by slow torture, without trial, or even without a hearing, were shut up in the horrible dungeons already described, where they were fed on the worst possible food until death relieved them from their suffering. Others, whom it was not designed to punish or destroy, but simply to detain, enjoyed every comfort, and a great deal of luxury. They had large rooms, fine furniture, excellent and abundant food, plenty of wine, books, and papers, could have their own servants, could be visited by their friends or families; in fact, could do pretty nearly as they pleased, except to go out of the Bastile.

Sometimes the Bastile was under governors who had a good deal of the milk of human kindness in their composition, and sometimes it was under the control of men who had as little feeling and sympathy as a stone. Prisoners were well or badly treated according as the governor was good or bad in character, and also according to the instructions which had been received concerning their treatment. The most horrible feature about the Bastile was the mode of sending persons

to it. No man could be safe from imprisonment there, and he was subject to the whims and caprices of the minister of state, whom no appeals could reach, and by whom no call for justice would be heard or heeded. If any man incurred the displeasure of the minister, or of any one who had sufficient influence to secure an order for his arrest under the royal seal, he might be taken to the Bastile at any moment. If his accuser desired that he should never more go out into the world, and never hold communication with any one, the accuser's will became law. Hundreds of men were sent to the Bastile without knowing the cause of their arrest or the names of their accusers, and without being allowed to communicate with family or friend. It was this uncertainty, this ever-present fear of injustice and cruelty, that made the name of the Bastile appalling, and led every Frenchman to regard it as a place full of horrors.

It is said that some of the most barbarous cruelties ever inflicted within the walls of the Bastile were during the reign of Louis XI. Louis himself was the author and inventor of some of the worst barbarities. It is recorded in history, that he caused dungeons to be made in the Bastile surrounded with smooth and polished masonry, where the prisoners, who were lowered into them, were obliged to remain in an unnatural position, which they could not change. According to history, the princes of the house of Armagnac were shut up in these horrible pits, and were drawn out twice a week to be scourged in the presence of the governor, and once in every three months to have two of their teeth torn from their jaws. Sometimes split sticks of dry wood were placed on their fingers, and then the sticks would be set on fire and allowed to consume. Richelieu sent many of his enemies to the Bastile, some of whom were treated with extreme consideration, while others endured great severity. One of these men, the notorious Bassompierre, was immured there twelve years by the order of Richelieu.

One of the greatest mysteries attending the Bastile is that of the Man in the Iron Mask. A great deal has been said and

written about him, some of it being fact, and some of it fiction. Who he was is not positively known. It is very certain that he was a personage of great importance, whom it was desirable to keep out of the way, and at the same time very desirable not to kill. He was always treated with the utmost consideration. Every one of his attendants uncovered his head when in presence of the mysterious personage. His clothing was of the finest character, his food was of the best quality, and served on the choicest table-ware. He was rarely left alone, and then only in a place whence he could not escape; his face was always covered with a mask of black velvet, fastened behind his head with steel bands. His private governor was De Saint Mars, and it is supposed that he was answerable with his own life for the safety of the Man in the Iron Mask, and for the preservation of his incognito. When first heard of he was confined in the Marguerite Islands, in the Mediterranean. One day a fisherman, passing near the place of his confinement, saw a hand wave towards him from a window, and a moment after, a silver plate was thrown out. The fisherman picked up the plate and looked at it: saw that some words were engraved upon it, and immediately took it to the governor of the prison. The governor looked at it carelessly, and then asked the fisherman if he had shown it to any one, or had read it. The fisherman answered, "No, your excellency, I have shown it to no one, and as for myself I cannot read."

"That is fortunate," said the governor; and giving the fisherman a gold piece, he dismissed him.

The gold piece, however, did the fisherman very little good, as he was assassinated that night by some unknown person.

Every piece of linen, every scrap of paper, everything which in any way would convey information, was scrupulously examined. One day the mysterious man made some writing on one of his shirts which was going out to the wash. By some means this escaped the notice of the jailers, and was found by the washerwoman. She could not read, and when she returned the linen, she called the attention of the governor to

the writing. She was rewarded for her fidelity with a gold piece, and she, like the fisherman, was assassinated on the night after she had obtained her reward. After this, the Man in the Iron Mask was always furnished with new linen every day, and that which he had worn was immediately destroyed.

From the Marguerite Islands, he was moved to the Bastile, where he died on the 19th of November, 1703. He was buried the next day in the cemetery of St. Paul, under the name of Marchiatti.

In the Bastile he was waited upon at the table and at his toilet by the governor, and no one else. He was allowed to go to mass, and a file of soldiers always accompanied him. Their muskets were loaded, and their matches were lighted; they were ordered to kill him instantly in case he spoke to any one, or attempted to tear off his mask. Who he was, and what he was, will probably never be known. No person of sufficient note to justify such precautions as were taken in his case was absent from the stage of history at that time. The general impression is, that he was an elder brother of Louis XIV., the fruit of an adulterous intrigue between Anne of Austria and the Duke of Buckingham, or some other of those lovers for which Anne was famous. As he was born in wedlock, he could not have been dispossessed of his claim to the throne, if his existence had been admitted. Louis XIV. may have had some absurd prejudice against murdering his brother, though it was not the fashion of those days to be so very fastidious. A story was written by Dumas under the title of the Man in the Iron Mask, and it has been dramatized and given on the stage in Europe and America. The mystery which envelops the wearer of the mask gives an additional interest to all stories concerning him.

In talking about this historic individual, we have almost forgotten the Bastile. After the time of Louis XIV. the Bastile became a place of imprisonment, not alone of persons of honorable birth, but of common malefactors, and of persons of very low repute. The imprisonment of Beuzot, the king's librarian, for obeying the king's own directions, by the min-

**DESTRUCTION OF THE BASTILLE.**

ister De Breteuil, brought to light the whole system of iniquity in which the prison was managed. On the 14th of July, 1789, the people arose in their fury, captured the Bastile, and ransacked and destroyed it. At the time of its capture only seven persons were found in its cells and dungeons, one of them having been there since his eleventh year. There was another who had been ten years in the Marguerite Islands, and thirty years in the Bastile; he appeared, on his liberation, bewildered and half idiotic, like a man waking from a sleep of forty years, and looking out upon a new world. The records of the prison reveal many cases as bad as this, and any lover of liberty, even to the smallest degree, cannot regret that the Bastile has passed away forever.

THE hardest known mineral in the world, and at the same time the most valuable, is the diamond. It cannot be cut or scratched by any other substance. In cutting the diamond, another diamond, or the dust of one, must be used. The process of polishing these stones by rubbing two of them together was probably known in Asia a great many years ago; but it was not introduced into Europe until the middle of the fifteenth century. The diamond-cutters of Asia preserved the secret of their work very carefully long after these valuable stones were brought to Europe. About the middle of the fifteenth century, Louis Berquen, of Bruges, accidentally discovered that by rubbing two diamonds together, their surfaces might be cut. The powder obtained in this way is used for polishing the stone.

The diamond must first be dug from the earth, and if we only knew where to find them we could doubtless discover richer gems than any of those now known. The earth which contains the diamond is worked in the same way as the auriferous gravels, both having been produced by the same causes. Gold occurs in the beds or streams, by the disintegration of the rocks, in which it was originally contained, and their gradual wearing and washing away. Diamonds were originally contained in the rocks in the same way that gold was held there, and the process of disintegration has been pretty much the

THE DIAMOND FIELDS OF SOUTH AFRICA.

same. Many of the places where gold is found contained diamonds; and in some localities in California the sands are now being reworked to obtain any small particles of gold that may have been left, and also to obtain diamonds. The original gold-seeker looked only for the yellow metal. The gold-seeker of to-day searches not only for gold, but for hard pebbles, which may prove rough diamonds.

Diamonds are found in various parts of the globe. The most celebrated diamond regions are those of India, South Africa, and Brazil. The Indian diamond mines are in various localities, the most famous being in the vicinity of Golconda. They have been exploited for thousands of years, and some of the stones now in existence have a history dating back two thousand years before the Christian era. The diamond mines of Brazil have latterly yielded more extensively than have the Golconda mines. At one time, a slave at work in a Brazilian mine struck with his pick a bed of diamonds which were valued at nearly two millions of dollars. They were carried to England, and caused a panic in the diamond market. The supply was the largest ever known to come forward at one time, and greatly frightened the holders of precious stones, not only in England, but all over the continent of Europe. If any individual could be so fortunate as to find a few million dollars' worth of diamonds at one time, he could create an alarm among the dealers in precious stones from one end of the world to the other.

The work of obtaining diamonds is not by any means the easiest in which a man can engage. About the hardest way in the world to obtain gold is to dig for it, and the same may be said of diamonds. In the Brazilian mines the earth consists of sand and gravel in the beds of the streams. It is taken out in the dry season, and piled away where it can be conveniently washed. Then in the rainy season the washing begins. Sometimes the men work by hand, as it were; that is, by taking a quantity of earth in a bowl, or pan, and then, standing in the middle of the stream, under the eye of a vigi-

lant overseer, they slowly wash away the sand and dirt, until nothing but pebbles remains.

The pick and shovel are used for breaking up the diamond-bearing gravels, just as they are used for breaking up earth which contains gold. The water carries away the clay, and sand, and fine dirt. The large stones are thrown out, and the finer gravel that remains is carefully picked over. It is examined in the sunshine, where the light plays upon the gems, and leads to their detection. The search for the diamond is always conducted under the eye of a superintendent, so as to guard against theft. Each diamond-seeker has a little case, made of reed, and generally ornamented on the outside. The small diamonds are placed in this case, and every negro who possesses a case which has once held diamonds is very unwilling to part with it. He regards it with a superstitious reverence, believing that when it once contains precious stones it will lead to the discovery of more.

The earth which has been gathered up for washing, if it is not worked immediately, is placed under a long shed, and when the rainy season begins, and water becomes abundant, the slaves are assembled for their duty. In the diamond district of Brazil the sheds are generally about thirty yards long, and half as wide. They consist simply of upright posts, and a thatched roof, erected over the spot where the heaps of gravel are placed. A stream of water is conducted through this shed. There is a range of sloping troughs, each about three feet wide, connecting with the streams at the upper end. Opposite the troughs there are high chairs, where the overseers are stationed.

A slave at each trough takes about a bushel or so of the gravel, and lets the water in slowly, in order to wash away the gravel and earthy particles. Then he throws out the largest stones, and examines the rest, with great care, for diamonds. Whenever he finds one, he stands upright, clasps his hands, holding the stone between his thumb and finger, and shows it to the overseer, who receives it.

When a slave finds a stone exceeding seventeen and a half carats in weight, he is immediately set at liberty. Free papers are given him, and he cannot again be enslaved. Generally, on such occasions, a holiday or half-holiday is granted to the negroes about the establishment. The lucky finder is carried on the shoulders of his comrades, and when the day ends most of them are in a condition the reverse of sober.

In the diamond district of Brazil the diamonds were first discovered by gold miners, about the year 1730. At first they were ignorant of the value of the gems, and threw them away as useless. Some of the stones were sent to the governor of Brazil as curiosities. He supposed that they were crystals, and by accident a few were carried to Lisbon, where they happened to be shown to the Dutch consul. The consul was a diamond sharp, and recognized the true character of the stones. He immediately caused them to be sent to Holland, where they were cut, and found to be of great value.

As soon as the character of the stone became generally known, large quantities of them were gathered and sent from Brazil, and at one time it seemed as if the diamond market would be ruined. The Portuguese government took means to secure a monopoly of the trade. The diamond district was surrounded by well-defined boundaries, which were guarded with the greatest care. No one was permitted to cross them without a permit from the superintendent of the mine, and whenever a traveller who had visited the diamond ground was leaving it, he was obliged to submit to a thorough examination of himself and baggage. So great was the vigilance, that, it is said, at one time every traveller leaving the district was detained three days at the boundary, and was compelled to swallow medicines whose effect was to prevent his absconding with any precious stones concealed in his stomach.

A peculiar system was established for the regulation of this district. Stringent laws were passed to provide for the registering of the inhabitants, the admission of settlers, and the punishment of infringements of every kind upon the govern-

ment monopoly. At first the diamond mines were rented to private individuals; but so many frauds were practised, that the government took the matter into its own hands, and worked the mines under officers of its own appointment. At present the mines are open to anybody who chooses to work them, on payment of a tax, which is placed not on the amount of diamonds obtained, but on the number of men employed. This method of collecting the tax is much more successful than the old one of levying a royalty upon the diamonds. The number of men employed can be readily counted, while, the diamonds being small, they could easily be secreted, and the payment of the proper tax evaded.

In Asia the most noted localities for obtaining diamonds are in various parts of India and the Island of Borneo. Two thousand years ago the mines of Golconda were the richest on the globe; but for some time they have been comparatively unproductive.

The working of these mines is carried on very nearly in the same way as the working of the mines of Brazil. In the Brazilian mines the slaves and overseers are permitted to wear clothing, though the slaves are allowed but a very small quantity. Formerly they were compelled to work naked, to prevent their secreting diamonds. At the present time the garments they wear are subjected to the most careful examination. In the mines of India the laborers work entirely nude; but the temperature is such that they do not suffer on account of the absence of clothing. In spite of every precaution they manage to steal diamonds. They secrete them in the hair, unless their hair is cut very short. They push them into their noses, and hide them in various parts of their bodies, and in other ways.

In one of the mines of Borneo there was once a laborer who managed to steal several valuable diamonds. As he wore no clothing when at work, and underwent the usual examination, he was considered entirely safe. He escaped with his prizes, became a rich man, lived contented, and died happy. In his old age he revealed the secret of his diamond thefts.

WORKING A DIAMOND CLAIM.

RIVER WASHING—CRADLING FOR DIAMONDS.

He had prepared himself for the work with the assistance of a surgeon, who shared with him the proceeds of the enterprise. The surgeon placed a ball, somewhat larger than a pea, in the fleshy part of the man's thigh; kept down the irritation as much as possible, and allowed the flesh to grow over the wound, or nearly so. The ball was then taken out, leaving a comfortable cavity a quarter of an inch below the skin. A small opening was made, and the skin at the opening was allowed to grow around a steel rod about half as large as the diameter of the cavity. In this way a very fine receptacle was formed for the deposit of the diamond.

It took some time to get it up, but when finished it was entirely satisfactory, and the man was sure of having his pocket always about him. When he found a diamond that could be crowded into this cavity, he would manage to stow it away; and then, at the earliest opportunity, he repaired to the office of the surgeon, where the diamond was removed with the aid of a pair of forceps. They did not strike for the largest diamonds, and were doubtless more successful in this mode of working than if they had planned their enterprise on a grander scale.

It is a general principle in chemistry, that when the component parts of an article are well known, a counterfeit can be produced, provided the component parts are attainable. But it is not so with the diamond.

For hundreds of years chemists have labored to produce this stone. They know perfectly well of what it is composed, but they cannot repeat it. The diamond is nothing more than pure crystallized carbon, and placed under a great heat it boils and disappears. It is not acted upon by acids or alkalis, and when kept in the open air, it may be heated to a high degree without damage. Exposed to the intense heat produced by a Bunsen burner, it is converted into coke; and if it is heated in the open air, it boils at the temperature of melting silver, and disappears in the form of carbonic acid gas. If the sun's rays are converged to a focus by means of a lens, and directed upon a diamond under a bell-glass filled with oxygen gas, the

diamond will burn; and when it is consumed, carbonic acid will be found beneath the glass. Thus the most precious substance in the known world can be made to disappear.

The diamond is sold by its weight, estimated in carats,—a carat being equal to three and one fourth grains Troy, and subdivided into half, quarter, eighth, and so on. It is difficult to say what a rough diamond is worth, since a great many reasons may occur to cause its fluctuation in value. The ordinary estimate for a cut diamond is sixty dollars a carat, that is to say, when the stone weighs a single carat. The price of the diamond exceeding a carat is not in proportion to its weight, but by the square of the weight, that is to say, to the weight multiplied by itself. Thus, if a diamond weighing one carat is worth sixty dollars, one which weighs two carats is worth  $2 \times 2$ , and then multiplied by sixty, or two hundred and forty dollars. A stone of three carats is worth  $3 \times 3$ , multiplied by sixty, or five hundred and forty dollars. The value, therefore, of a polished diamond is found by multiplying the square of the weight by the price of a stone of one carat. This is the rule generally given for the pricing of diamonds; but the value of each stone varies more or less according to its character, so that one stone weighing fifteen carats might be worth three or four thousand dollars more than another stone of the same weight. The best rule, probably, for obtaining the price of diamonds, is to ask a man who has them for sale. Diamonds are sold very much like any other commodity; that is, for the highest price the purchaser is willing to pay.

Diamonds, especially those of a large size, require, it is needless to say, great care in keeping, to save them from being stolen. The crown jewels of England are kept in the Tower of London in an iron cage surrounded with glass. Some of them are of great antiquity. The crown jewels include not only diamonds, but some valuable rubies, sapphires, emeralds, and pearls. The crown contains a heart-shaped ruby, which is said to have been given to Edward the Black Prince by Don Pedro, King of Castile, after the battle of Najera, A. D. 1367.

It was afterwards worn in the helmet of Henry V., at the battle of Agincourt, in the year 1415.

The crown jewels of France disappeared in 1792, during the troubles of the first republic, though they were kept under seal, and in the royal treasury. Some of them were afterwards found buried in an obscure place, which was named in an anonymous letter sent to the prime minister. The famous Regent diamond was in this casket.

The Regent diamond is probably the finest and best cut stone in the world, though it is not the largest. It was named after the Duke of Orleans, who was regent during the minority of Louis XV. The regent bought it, in 1717, for one hundred and thirty-five thousand pounds sterling. It was sold to him by Governor Pitt, who paid twelve thousand five hundred pounds for it in India five years before. Its weight before cutting was four hundred and ten carats, and the process of cutting occupied two years. Its weight was reduced to one hundred and thirty-six carats, and its present value is estimated at a million dollars.

Pitt was an unhappy man during the five years he owned the stone. He carried it with him constantly. He never made known his movements a day beforehand, nor slept for two nights successively in the same house.

Another diamond, quite famous in its way, is the "Sancy." It fell from the helmet of Charles the Bold at the battle of Granson, and was picked up by a Swiss soldier. The soldier disposed of it for two francs, and thought he had made a very good bargain. In 1589 it was bought by De Sancy, treasurer to Henry IV. of France. In 1792 it was stolen, and after various adventures, was bought, forty years afterwards, by Prince Demidoff, who paid for it seventy-five thousand pounds. It has since been sold for a much smaller sum.

A few years ago a diamond was found in Brazil, and imported into France under the name of the Star of the South. It was found by a negress, and bought for a few dollars by a speculator, who obtained a large return for his investment. Its weight in the rough was two hundred and fifty-four carats; after cutting, it was one hundred and twenty-four carats.

Another famous stone, known as the Grand Duke of Tuscany, is of a yellow color, and weighs one hundred and forty carats.

It was lost at one time, and bought subsequently, it is said, for a few francs, out of a jeweller's shop at Florence, the jeweller supposing that it was only a piece of colored crystal.

A famous diamond in Russia is the Orloff. It is shaped like an egg, with an indented hollow in the smaller end. It was found at Landak, in India, and at one time formed the eye of an idol in a Brahmin temple at Pondicherry. An enterprising deserter from the French army managed to have himself shut up in the temple, and during his incarceration he gouged out this eye of the idol. He attempted to capture the other eye, but was unsuccessful. He was lucky enough to get away with his prize, which he sold to a jeweller at Calcutta. After passing through the hands of various purchasers, it was bought by a Greek merchant, who sold it to the Empress Catharine for four hundred and fifty thousand dollars, and an annuity of twenty thousand dollars, with a title of nobility.

One of the best known, and probably the most famous, diamonds in the world is the Kohinoor. It is interesting for the great number of historical associations connected with it. It is said to have been worn by an Indian king three thousand years before the Christian era. From this king the Kohinoor passed through the hands of successive sovereigns of Central India, until about the beginning of the fourteenth century, when it was added to the treasures of Delhi by the Patan monarch Aladdin. In 1739 the Persian monarch Nadir Shah conquered Delhi, and had an interview with its vanquished ruler. The latter put on his best garments in order to make as good an impression as possible. He wrapped a gorgeous turban around his head, and in it he fastened the Kohinoor.

The Persian conqueror, during the progress of the interview, saw this diamond, and, in the expressive language of modern days, "went for it."

He was too polite to capture it by main force, but proposed eternal peace and friendship to Mohammed Shah, the van-

quished ruler of Delhi. The latter, like Barkis, was willin', and the two embraced.

"As a token of our friendship," said Nadir, "let us exchange turbans." Mohammed was cornered and obliged to comply, and Nadir walked off with the prize. But Nadir did not keep it long, as he was assassinated soon after.

After his death it passed to the hands of Ahmed Shah of Cabool, and thence through various other hands, until in 1849, when, on the annexation of the Punjaub to the East India Company's territory, it was stipulated that the Kohinoor should be given to the Queen of England. It was sent to England, and was delivered to the queen July 3, 1850. It was exhibited at the Crystal Palace in London, but caused great disappointment by its inability to develop the proper refraction, unless surrounded by strong lights; in fact, it was much inferior to its glass model in the Tower. Its name, Mountain of Light, seemed to be a misnomer.

An examination was made with a view to recutting it. Scientific gentlemen were called in, and skilful cutters at Amsterdam were sent for. After much consultation, it was determined to recut the stone. The proper machinery was prepared, and set up, and the Duke of Wellington was required to begin the work.

In cutting a diamond, the stone is firmly embedded in lead at the end of a stick. Only the portion which is intended to be cut is exposed at one time. The Kohinoor was properly fixed in its leaden surrounding, and placed in the hands of the duke. He held it firmly against a swiftly revolving wheel covered with diamond dust, and in a little while the first facet was finished. Then the stone was placed in the hands of the workmen who were to continue the operation; and when their labors were completed, the Kohinoor was found blazing brilliantly, and justified its title as the Mountain of Light.

The largest and most valuable diamond in the world, so far as known, is presumed to be the one so long owned by the Sultan of Matan, Borneo. It weighs three hundred and sixty-

nine carats, and is valued at five million dollars — a very good piece of property to have : but it is said to be so carefully kept, that no ordinary diamond thief can obtain it.

Though diamonds cannot be made artificially, they can be imitated, and the imitation is almost perfect. Several French manufacturers of bogus diamonds have obtained high reputation for their skill. Flint, white sand, and silver are the substances used ; at least they are said to be the substances, though there is doubtless some other material added which the manufacturers do not mention. These fraudulent diamonds, in weight, color, and brilliancy, are almost identical with the genuine ones, and some of them have even deceived the dealers. They will stand some, but not all, the tests applied to diamonds. They reflect the light perfectly, but are apt to grow dim in a few weeks, and require fresh polishing. The diamonds sold in New York under the name of Alaska, Australia, or California diamonds are mostly of French manufacture, and were never seen in the locality whose name is applied to them.

False diamonds have become so common among certain classes of Americans as to cause the real diamond to be used very rarely among other classes. During the prosperity of the famous Tammany Ring, false diamonds blazed on many a political shirt-front, where they could be seen and admired of men.

The followers of the Ring politicians were generally equipped with false diamonds ; but the great leaders, like Tweed and his companions, decorated, or were supposed to decorate, themselves with the genuine article.

There are many strange stories told in connection with diamonds. We have already seen through what vicissitudes the famous diamonds have passed.

A story is told of a French prince, who, while travelling, was attacked by robbers. He had intrusted a valuable diamond to a faithful servant. The servant was slain, but the master escaped. He returned subsequently to the scene of the fight, and sought for the diamond, but could nowhere find it. At last he bethought himself to examine the body of his

attendant, when he found that the latter had swallowed the diamond to preserve it.

Some years ago an actor, looking through an old clothes shop in London, found a pair of slippers decorated with glass beads, and suited to a character he was about to play. He bought them for a trifle, paying two or three shillings for them. He wore them on the evening of his performance, and used to leave them lying carelessly about the theatre. He had them a year or more before discovering, as he did, by accident, that the supposed beads were diamonds, and that the shoes which had cost him a few shillings were worth thousands of pounds. He sold them soon after making the discovery, and retired upon the fortune so easily obtained. He never took the trouble to ascertain their previous character or history.

About twenty years ago, in a gaming-house in New York, a gambler, who may be called Smith, put up a ring as a stake, against an outside player for a hundred dollars. The player — I call him Jones for sake of convenience, — won the ring and went away with it. Smith had received the ring a short time before as a present, and was told at the time that it was false, or, as it is generally called, "paste." Jones took the ring next day to a jeweller, and asked what it was.

The jeweller said, "It is paste — worth about two dollars."

"Have you a genuine stone like it?" Jones asked of the jeweller.

"Yes," was the reply, "I have one exactly resembling it, worth five hundred dollars."

"Will you take out the paste and set the genuine stone in its place," asked Jones, "provided I leave you its value as security, and pay you for the use of it?"

"Certainly," was the reply; and the bargain was quickly settled. The change was made, and Jones walked away with the ring.

That evening he was in the same gaming-house, and was chaffed by the friends of Smith on obtaining a paste ring against a stake of a hundred dollars. Jones insisted that the

ring was genuine, and offered to back his opinion with a bet of a hundred dollars. The bet was taken, and it was agreed that Jones, Smith, and a person selected by the two, should go together to the prominent jewellers and ascertain the value of the ring.

Next day they visited the stores, and jeweller after jeweller examined the stone, and pronounced it genuine, and worth four or five hundred dollars. Most of them were ready to give four hundred dollars for it.

The bet was paid, and Jones departed to drive with a friend up town ; but on his way he called at the jeweller's, exchanged the genuine stone for the paste, obtained his five hundred dollars he had left on deposit, paid for the use of the diamond, and slipped away.

That evening he was again at the gambling-house, and rallied Smith on having sold himself. Smith acknowledged that he had been deceived, but he never supposed the ring was worth anything, and was surprised to find that the stone was genuine.

" Well," said Jones, " I don't wish to take any mean advantage of your stakes ; you staked that ring for a hundred dollars, and the jewellers said it is worth four or five hundred dollars. For a hundred dollars, the amount of your stake, you can have it back again.

Smith bit at the offer, paid the hundred dollars, and received the ring. Jones departed, and did not return. Imagine the disgust of Smith when he subsequently found out the real state of affairs.

## XXVIII.

### THE UNDER-WORLD OF PARIS.

THE IMMORALITY AND LICENTIOUSNESS OF THE CAPITAL. — COMPARISON WITH OTHER CITIES. — FRENCH ETHICS AND LITERATURE. — DIFFERENT GRADES OF THE DEMI-MONDE. — THE TRUE STORY OF CAMILLE. — THE GARDENS ON THE SEINE. — THE DANCES AND THE DANCERS. — THE PETITS SOUPERS OF THE CO-COTTES. — AFTER-MIDNIGHT SCENES. — ACTRESSES AND CHAMPAGNE. — ADVENTURESSES AND CHATEAU MARGAUX. — INTERIOR OF A THIEF'S DEN AND MURDERER'S CELLAR. — BLOODTHIRSTY VIRAGUES AND DESPERATE CUT-THROATS.

THE demi-monde is aptly named; for, while it is so eminently worldly, the world rejects it, and in most instances assumes to be unconscious of its existence. In the French capital it is accepted as a fact, and it can hardly be any more dangerous there on that account, than it is in cities where it is ignored. The French have gained the reputation, but without any good reason, of being much more immoral than other nations. We Americans are constantly asserting this, and our iteration has had the effect, no doubt, of inducing us to believe that we are a great deal better than they. Our assumptions are unquestionably loftier, and we are more anxious to hide our defects; but that we have fewer vices, setting aside our pretences, and stripping off our shams, must not be too hastily admitted. It is to the disadvantage of the modern Gauls that on many subjects they are inclined to say what they think, while we are disposed to think what we do not say. They, too, take human nature as they find it, as it has been from the first; having no expectation of changing it by shutting it up on one side, and giving it free vent on the other.

French authors are not at all squeamish or puritanical, and

are addicted to the treatment of themes which we discuss only in private. The cities of France, notably Paris, do not robe themselves in external sanctity, careless of the inner quality of their ethical raiment, and, on account of their openness of speech and deportment, they are gravely misjudged.

Paris is bad enough, Heaven knows; but that it is the wickedest city on the globe, as is frequently asserted, must be taken with large grains of allowance. The wickedest of cities are numerous. Not only has Paris that reputation, but Vienna, Naples, St. Petersburg, Berlin, London, New York, have it also. Even Boston, the centre of the land of steady habits and high moral ideas, is pronounced by many persons, who know it intimately, as unequalled for private profligacy. Stockholm, in the far and frozen north, where the temperature might be fancied to freeze the evil passions before they could have full play, has often been declared more immoral than Paris, Naples, Vienna, or London. In proportion to the population, there are more illegitimate children born in Stockholm, it is said, than in any other capital of Europe; and as marriage is held to be the best and purest condition of men and women, this extraordinary extent of illegitimacy must be interpreted to the Swedish city's discredit.

It is all folly to arraign any particular community as worse than another. Communities are like the individuals who make them up. This has certain defects which that has not. Circumstances and conditions produce different results in different places; but, on the whole, mankind, when thoroughly understood, will be found very similar in most of the centres of civilization.

As Paris is acknowledged to be the capital of gayety and pleasure, and as morals are left there to take their natural course rather than to be hampered without benefit, Paris is the best place to observe human nature in its disapproved relations. The demi-monde is opposed to the grand-monde, and ought to represent, therefore, not only women of a peculiar class, but the members of both sexes whom society, as the expression of conventionality, refuses to acknowledge. The

GRAND AVENUE OF THE CHAMPS ELYSEES.

demi-monde, in this sense, means the under-world, nowhere so interesting a study as on the Seine.

Outwardly, the French capital is most decorous. Vice shows like virtue because it is relieved of grossness; even more, is softened and rounded with grace. You do not see there, as in London or New York, repulsive and revolting scenes. You do not encounter drunken and disgusting men: you do not hear women, who have unsexed themselves, indulging in ribaldry and profanity in the public thoroughfares, or anywhere else in fact. Everybody and everything appears so proper that inexperienced and innocent souls have expressed their astonishment at the ill fame the city has acquired, and have concluded that its bad name is undeserved. Promenading on the Boulevards or riding on the Champs Elysées, they are unable to distinguish the Faubourg St. Germain from the Quartier Latin — the upper-world from the under-world.

It is estimated that more than fifty thousand of the women of Paris live in a state of concubinage, which, in a population of two millions, is something enormous. The proportion is startling, but more from the facility attained there for procuring statistics than from the fact itself. Actualities, whether painful or not, are known and recorded in that capital, instead of being unsuspected, as they are likely to be elsewhere. This vast number of unchaste women are by no means professional courtesans, — probably five thousand would include all of these, — but embrace half a dozen grades of illicit relations.

The causes that contribute to prostitution in France are, first, the unwillingness of men of education and position to marry girls who are poor, and can therefore have no marriage portion. Wedlock among the Parisians is far less sentimental and romantic than it is with us. It a species of one-sided covenant and partnership, in which the wife is expected to be loyal, and the husband to do as he pleases. He cares less for sympathy and affinity than he would if he did not expect to seek them outside of the domestic circle. He marries

generally for practical reasons ; because it will benefit him socially, or be of substantial advantage. In consequence of this, young women in humble circumstances are little likely to be wedded. They have hearts if they have not incomes, and when their affections are enlisted, they listen to the voice of Nature without waiting for the sanction of the priest. It is not the custom, either, in France for men or women to wed out of their station, though love or passion does not respect social lines or distinctions in that country more than in any other. Hence it may be seen that unwedded wives must be numerous in Paris.

Another cause is the draft that the army makes upon the young men of the country. Compelled to enter the military service before they are married, their habits are such, after they have remained in the army the allotted time, as do not conduce to matrimony. The whole land is drained for the sake of steel-and-gunpowder parade. Thousands and tens of thousands of people who have no interest whatever in, and are only made the worse for, war, are compelled to furnish its sinews at a ruinous cost to themselves.

Still another cause is the number of illegitimate children, who, regarded as the children of the state, are reared and educated by the state, and at a certain age are left to provide for themselves. Many of the young men seek military service, while the young women, for the most part, become what their mothers have been before them. Their tastes and their ideas are superior to their rank. They are unwilling to look for husbands in a lower grade, and cannot secure them in a higher. Gallants and lovers, however, are abundant and persevering, and under the circumstances seldom woo in vain. France, moreover, tolerates, if it does not encourage, relations that other countries raise their hands in holy horror at. It does not act on the conviction that the absence of one virtue expels all the other virtues ; it refuses to brand and ostracize a woman because she has merely been unfortunate, or to make her responsible for the wrong she has sustained at the hands of man. France, it must be admitted, is juster to

women than other nations are, for it gives them an opportunity to be independent and advance themselves, even though they have committed what we might regard as the unpardonable sin.

The first circle of the demi-monde in Paris and other French cities, though it is not so called, includes the educated and rather refined women I have mentioned, who from poverty, dependence, or want of fixed position, cannot marry in the rank to which they properly belong. Their antecedents shape their destiny, and they hardly regard the relation they have been accustomed to consider inevitable as they would regard it had they been differently trained, and had the ethics of the nation been less liberal.

The second circle is represented largely by the grisettes. Many of them marry, and live domestically all their lives; but many others have a gay and coquettish disposition, prefer lovers to husbands, excitement to routine, display to conventionality, and the exhilarations of to-day to the serenities of to-morrow. These are truly of the half world, for they are half married, and yet wholly independent. They live with their masculine friends; take care of their apartments; are their companions at concerts, balls, and theatres, in the evening; and yet they have their regular daily duties at the shops where they are employed. They are not isolated: they have society of their own; are contented, cheerful, and often enjoy themselves better than the women who have been honored by wedlock.

The most showy and best defined type of the demi-monde is the adventuress, who is the popular representative of the entire class. The French playwrights have delineated her fully, and made her familiar to everybody. "Camille," and "The Marble Heart," have heroines of this sort. The former drama treats her sentimentally, and the latter cynically. She is not so generous and self-sacrificing as Camille, nor so selfish and sordid as Marco. After Alexandre Dumas wrote "Camille," and achieved such astonishing success, another Parisian *littérateur* composed "The Marble Heart" as an offset to it, declaring Marco to be the real, instead of the ideal lorette.

The story of "Camille," or "La Dame aux Camélias," as it is termed in the original, is founded very largely on fact. The central figure of Dumas' pathetic drama had genuine existence. Her name was Marie Duplessis. She was as lovely in person and as elegant in manner as she is portrayed on the stage. Indeed, the theatric picture was almost a photograph, and the incidents of Marie's life have been closely followed. The Armand was a young and excessively romantic physician, who, having met the beautiful cocotte at an opera ball, fell so desperately in love with her that he wished to make her his wife. She had too much good sense and prudence, independent of feeling, to permit such a sacrifice; but his devotion and generosity touched her nearly, and soon awoke an answering passion. In spite of her errors, she seems to have been intrinsically a fine and noble woman, who, under favorable circumstances, might have been pure and true. So much was she impressed by his chivalry that she cast off her admirers, purchased a handsome villa near Versailles, and begged her new lover to share it with her. He did so; for he was infatuated with Marie, and would not listen to the sober counsels of his family and friends. His father, in very moderate circumstances, was sorely troubled at the conduct of his son, who had no thought nor care for anything but his mistress. The old gentleman, unable to influence the headstrong boy, sought an interview with the lady of the camélias, and begged her to break off the connection. She undertook the task, and succeeded where his family had failed. Her success, however, was obtained at the expense of truth and her own heart: for she made her lover believe that her attachment to him was waning.

Armand, with all the gloom of the Inferno weighing upon his spirits, went to Italy, trusting that absence and travel would enable him to forget the woman he now deemed unworthy of him. He was gone a twelvemonth. He bore separation much better than she, as men usually do. Before half that time the charming lorette fell ill and died. The doctors asserted that her ailment was consumption, but the poets in-

sisted it was a clear case of broken heart. Her death, with her previous history and romantic reformation, moved the curiosity and appealed to the sentiment of Paris, especially after the tale had been told in gushing style, and in any number of short paragraphs in one of the gossiping journals.

When the villa at Versailles was advertised for sale, with its elegant furniture and dainty articles of vertu, a crowd gathered, and the bidding was so spirited by reason of active competition, that everything brought nearly double its actual value. Dumas, then quite young, was present, and secured, as a memento, a handsome ring which Marie had worn.

Six months after, some one called at Dumas' house to see him personally. The author found the stranger to be a pale and melancholy young man, who said he had come with the hope of buying the ring that had been purchased at the sale. Further conversation revealed the fact that the stranger had been Marie's lover; that he had given her the ring; and now, overwhelmed by the news of her death, of which he had just been apprised, he begged, as a special favor, that he might be permitted to purchase what to him had such inestimable value.

Dumas, deeply touched by the story, insisted upon making a present of the trinket to the bereaved youth, and afterwards wrote out the tender tale which has since drawn tears from half the world.

The adventuress is usually favored by nature, and carries her fair face and symmetrical form to the best market. If not handsome, she is winning, has great *chic*, clear insight, a thorough understanding, and the weaknesses of our common humanity.

Good and kind at first, she has become what man has made of her; and in the vocation she has chosen, vanity and self are her impelling powers. Her beauty is a commodity she offers to the highest bidder. She receives large sums, but she squanders them recklessly; for display is almost the only passion of her being. She shines in the Bois; bets desperately at Baden; turns heads at Vienna; shocks the proprie-

ties of London ; dashes resplendent along the Nevski, in the height of the gayeties of Petersburg ; creates a sensation at Florence ; astonishes the staid Germans at Berlin ; interrupts the opera at Madrid ; and finally, furnishes the subject of a letter for the New York Herald.

Her career is necessarily brief, for her reign must end when years begin to tell. Between twenty and thirty-five her golden harvest must be gathered. Not unfrequently she dies by her own hand ; but oftener she has learned prudence ere her charms have waned, and is contrite when it is no longer easy or graceful to sin. It is a great mistake to suppose that the adventuress is invariably drawn out of the Seine, and exposed at the Morgue. No longer able to repeat her triumphs, she likes to withdraw from Paris, in some retired town seek the consolations of religion, and bestow charity upon the poor. She is more interesting at forty than in the flush of her glowing youth ; since then the flame of her self-love has been allowed to smoulder, and the radiance of her true womanhood returns once more.

The fourth circle of the demi-monde are those priestesses of Venus who sin without satisfaction, and laugh without gayety. They are not materially different in Paris from what they are in other cities. They have gone down by slippery and sable steps, but not to a level with despair. They do not despair and live, in the air of France ; for with despair comes the pan of charcoal. They have intervals akin to cheerfulness, and highly-spiced sensations bounding from pleasure to delirium. They need not cease to hope or fear, since there is still a deeper deep ; and that is the fifth circle, whose representatives frequent the streets at night, the cheaper cafés, and the common gardens, in search of means to continue in their horrid trade. Even these are not so degraded as the same kind of unfortunates are with us. They do not drink ; they do not swear ; they do not importune strangers rudely ; they do not from the first disgust in their effort to attract. They have apartments of their own, a certain kind of society and a species of freedom that women, however fallen, always

Ball at Middle.

enjoy in France. They are not labelled outcasts, as in England and America, and therefore, in their darkest hours, they have glimpses of the heaven of hope. Careless and improvident as they are in their youth, they frequently provide for the future as years go on, and come to their end through confession and ecclesiastical forgiveness of all their transgressions.

The sixth class, the lowest and last of the semi-mundanes, are more nearly pariahs than any others of their kind. They rarely make any provision for to-morrow, since to-morrow is as dismal and as painful as to-day. Almost always in want, their wastefulness is such that they would be poor if every month were marked by a shower of gold. It is they who accost strangers at night on the Boulevards; ask loungers in the cafés to buy coffee and wine for them; make *poses* and smoke cigars in the streets; and are sometimes arrested for brawls, intoxication, and pilfering. When they have reached this grade of degradation they cannot go back; they cannot stand still; they cannot fall lower. They put formidable obstacles in their proper path, and are their own worst enemies. Such elasticity and endurance as they may have is soon spent. Before a great while, a damp cellar or dingy garret is broken open, a suffocating odor is perceived, the rude bed holds a corpse; a brazier of charcoal tells the story, and adds another to the countless tragedies which invariably keep the balance with life.

The gardens of Paris, like the Mabilles, the Closerie de Lilas, the Chateau Rouge, and many others reveal another feature of the under-world. The Mabilles, to which strangers generally go, is the least indecorous, and, I may add, the dull-est. There half a dozen couples, the women being generally of the lowest demi-monde class, are paid so much per night for dancing of the most extraordinary sort. What it lacks in delicacy is made up in energy. The greatest ambition of the *cocottes* is to kick the hats from the heads of their partners, and to throw their drapery into the wildest confusion. Their movements belong rather to gymnastics than the quadrille,

which they pretend to execute, and when their leaping and plunging begin to pall upon the spectators, they have recourse to the shamefully indecent can-can.

The Mabilles draws strangers, as honey draws flies. Eminently respectable and altogether staid persons go there, and closely observe the dancers, without any apparent disapproval too, when they would be supremely shocked at home at the slightest intimation of such licentious conduct. I have observed pious matrons from New England watching the saltatorial goddesses through their spectacles, as they might watch the gambols of unknown animals. The Mabilles soon grows wearisome, and few persons frequent it on their second visit to Paris.

The Chateau Rouge is a more extended, demonstrative, and free-and-easy place of resort than the Mabilles. It is much more democratic also; the prices of admission for men (women are admitted without charge) being one franc, instead of three. To encourage attendance, prizes are offered to those who shall be present the greatest number of nights during the season, and the announcement of the prizes is placarded upon the wall, so that every one may see them. Silk gowns are the temptations for the gentler, and watches for the sterner sex. I should imagine that some of the girls expected a reward for lifting their gaiters in a direct line above their heads, so often do they attempt it, and so generally do they succeed.

The Closerie de Lilas, called the Prado in winter, is the place where the students and the grisettes go in crowds, and where they whirl and make merry for the pure love of the thing. The attendance is very large on Thursday and Sunday nights, when I have seen five or six hundred persons of both sexes, flushed with wine, and dancing like mad dervishes. The revels there are fast and furious enough. License reigns supreme, and Bacchus and Venus seem to inspire the orgies. Paris always limits its public exhibitions, and minions of the law are ever present to keep licentiousness within bounds. Without stimulants the grisettes and cocottes become wild

SCENE AT CLOSERIE DES LILAS.

with excitement as the music of Offenbach pours out under the sky to infect them with its sensuous frenzy. Doubtless the students and their lemans enjoy themselves to the utmost ; for they could not counterfeit enjoyment so excellently. They smoke, and drink, and laugh, and talk, and chat, and caper together without the smallest reserve or restraint, as if they had not, and never would have, any other thought than of the present moment and its absorbing pleasure.

When the weather is unfavorable, they have their balls in a large, covered space : and to see and hear them leaping, tumbling, screaming, and roaring in one confused and palpitating mass, impresses the self-contained and impassive Anglo-Saxon very strangely. Those French revellers have few concealments. They do their wooing in the presence of hundreds ; they have their little quarrels in the midst of their carnival of glee. Elise appeals to Jacques with shrugs and starts, and streaming eyes ; and Victoire complains of neglect, and emphasizes his jealousy to Marguerite before the giddy throng, as if they were in the privacy of their own apartments. They make up their differences with petting words and copious caresses, and enact their melodramas regardless of curious eyes and smiling lookers-on.

There are resorts, and not a few, in Paris, of a more private character, where decorum is not observed, and where restraint is not practised. All evil passions are there let loose, and vices revealed that would be repulsive to any but morbid minds. Such shameful entertainments are declared to be in imitation of ancient Grecian revels and Roman rites. The claim is noteworthy, for Paris, in its most revolting and secret sins, never forgets to assure itself and the external world that such entertainments are sanctioned by classicism. These may be imagined : they certainly cannot be described.

The *petits soupers* of the under-world are reckoned by many among the attractions of the French capital. They occur at many of the restaurants, though at Peter's and the Café Helder they are given with the most flavor. These little suppers begin after midnight, and continue until dawn, and

though the best of them are private, the public ones, or rather those in public places, have enticements for the masculine mind, on account of the eccentric women to be found at them. At Peter's and the Café Helder are spacious saloons, provided with small tables; and about one o'clock in the morning, parties of gayly-dressed ladies, with their gallants, and often without gallants, begin to arrive. Many come in carriages, but some on foot, albeit the pedestrians are attired like stage queens. The majority of the women are lorettes, of different grades, but not a few of them are the inferior actresses of the Gaîté, Variétés, and Gymnase, and the ballet girls of the Vaudeville, Ambigu, and Folies Dramatiques. There they completely unbend, cast reserve to the breezes, take easy positions, chatter like magpies, blow small clouds of smoke at the frescoed ceiling, or keep time to the clinking of champagne glasses with their symmetrical feet. Those unescorted are entirely willing to be invited to partake of salads, ices, or wines by the gentlemen who drop in from mere curiosity, or from a desire to make feminine acquaintances.

Between two and three o'clock the sexes become adjusted to each other; everybody is eating and talking, drinking and smoking, at the same time. The handsome rooms resound with feasting and merriment. Glasses rattle, forks clatter, tongues wag, songs are sung, toasts given amid the highest glee and enthusiasm.

Standing in a chair, with a beaker of sparkling Clicquot, is the pretty soubrette of the Gymnase, making a mock-heroic speech; and at the end of every sentence she is greeted with the clapping of hands and loud huzzas. Near her the graceful danseuse of the Folies, encircled by the arms of the dramatic critic of the *Figaro*, is offering a toast in a goblet of Château Margaux, and at the other end of the saloon, two brunette deities are giving a bit of the can-can, in the midst of vociferous cheering.

Stretched on a velvet sofa, her heels elevated above her head, Marie Basquinette, a famous adventuress, who has just

come from London, is entertaining her listeners with a droll account of the awkwardnesses and stupidities of the English. (Whenever the French wish to be particularly funny, they always caricature John Bull; and many of them really believe that no Briton can, by any possibility, appear other than uncouth and ridiculous.)

The French prints of well-dressed carousals with which we are so familiar, might be actual photographs of the *petits soupers* and their surroundings at the Café Helder. As the night wanes apace, and as the east grows gray, the revellers begin to disappear. There is something ghastly in the daylight surprise after a debauch, and the Parisians flee from it as if it brought sermons and endless prayers.

What we should call the dangerous classes would seem, from the fair outside of Paris, to have no existence there; and yet, as the police well know, many of the most cunning thieves, audacious burglars, and desperate scoundrels are native and to the manner born. They keep out of sight by day, and are rarely seen in the fashionable quarters, unless they have some special mission of villany. These fellows have their organizations and their amusements, and herd together and hold nocturnal revel in out-of-the-way dens, where no one but the gendarme or government spy would think of looking for them.

Having some desire to become acquainted externally with French scoundrels, I mentioned my desire to a private detective, who promised to take me to the district known as the Batignolles, where, he said, many of the choicest miscreants of the city were in the habit of assembling on Sunday nights. He told me that, while there was not likely to be trouble or danger, it would be well to be armed; and so, with two revolvers each, we sprang into a calèche, one stormy Sunday evening, at the Grand Hôtel, and drove to our point of destination.

After nearly an hour's ride through narrow and dreary streets, over rough pavements, and past malodorous neighborhoods, he stopped before a tall stone building, that looked like a deserted mill.

Not a light was visible anywhere, and, as the night was dark, I asked my guide if he were not mistaken in the locality. He assured me that he was not, and, taking my hand, told me he would lead the way. I could see nothing; but after we had stumbled along for a few seconds, a flash of lightning revealed a long, narrow stone staircase before us, and down this we slowly crept. At the base was a heavy oaken door, which appeared as if it might withstand a battering-ram, and I was wondering how we were to open it, when the detective put his mouth to the key-hole, and gave a peculiar whistle. The door swung open at once; we stepped into a dismal vestibule, and were confronted by a huge figure, who grunted out, "*Tout bien*," as he recognized my companion, slammed to the door, and bolted it securely. So large a Frenchman I had hardly seen. He was a giant in proportions, and I discovered by a few phrases, that he was an Alsatian. He knew what we wanted, and told us, pointing in the direction, to go to the main hall, where, to translate him freely, the boys were very lively, and having a good time.

A few steps brought us to the hall,—it should have been called a cellar,—and in it were some fifty of the most villainous-looking men and coarsest women I had ever had the misfortune to encounter. It was evident, at a glance, that they were thieves, robbers, and assassins; the slightest acquaintance with phrenology and physiognomy made that clear—that some of them were of the sneak, some of the burglar, and others of the desperado order. The place was dimly lighted with a few sputtering candles; the ceiling was low, and the air mephitic. A few of the men were standing and smoking pipes; but the greater part sat at rough tables drinking and talking in hoarse tones, with vile oaths, on subjects in which it was natural they should be interested.

A murder that had been committed a fortnight before in Marseilles, an account of which had been printed in the Paris journals, occupied much of their attention. They were very laudatory of the skilful manner in which the crime had been perpetrated, and of the adroitness displayed by the criminal in

getting away. They had not a particle of pity for the victim, an old and inoffensive man, whose throat had been cut while he was asleep in bed, that a trunk in his apartment might be broken open and plundered of a thousand francs.

The women, if they might be termed such, were more brutal and bloodthirsty in their dispositions, judging from their expression, than the men themselves. They were, as I was informed, either thieves themselves or aids and accomplices of the thieves. Some of them were what we should style shoplifters; others made it their business to obtain information from servants in regard to private residences, and imparted it to the burglars with whom they consorted.

One Amazon, who had a mustache and slight whiskers, had committed two murders, the detective said—one in Lyons, and the other in the arrondissement Vaugirard. She had been so adroit that she could not be convicted on trial, though there was not the least shadow of doubt of her guilt. She was a species of she devil in that tophet, and, as I perceived, was looked up to as something of an oracle. She planned many of the boldest robberies, and was herself regarded as absolutely fearless. She must have been very strong; for she was as broad across the shoulders as a grenadier, and her rolled-up sleeves showed that she had muscle like a blacksmith. I would much rather have encountered a masculine ruffian and assassin than that virago, who seemed fierce and cruel, not from passion, but from nature. There was a tigress look about her which made my flesh creep and my hair bristle. She appeared so bloodthirsty that I should not have been surprised if she had sprung upon me and fastened her fangs in my neck.

The thieves and robbers in the cellar knew the detective of course, as they know detectives all the world over: nodded to him familiarly, and asked him in an argot—which had to be translated to me—if he had been successful in making any arrests recently.

I observed that they changed their tone of talk as we entered, determined not to give him any clew to their latest

crimes. They continued, however, to discuss the exploits of the members of their profession, and to express the warmest admiration for the greatest scoundrels. It hardly seemed possible that human beings could be so hardened and so vicious, and that they could find their chief gratification in disorder, violation of law, and revolting iniquity. These fellows were more like brutes than men in semblance. Their eyes had a fierce and lurid expression; their mouths were sensual and coarse; their jaws had a heavy, animal-like firmness; and their whole faces were dark and forbidding. I noticed that many of them drank spirits, which is uncommon in France, and that the largest potations did not sensibly affect them.

Three or four of the gang were so repulsive in feature that I felt a curiosity respecting their history, and made inquiry thereabout of the detective.

"That chap sitting down with the short pipe in his mouth," said the legal bloodhound, "is not more than thirty years old, though he looks nearly fifty. He was born and reared in or near this city, and has been a thief since his earliest childhood. His father was a noted burglar, and died in prison at Bordeaux, where he had been arrested for an attempt to break into the vault of a bank. The man's name is Pierre Boudrot; but he is called by his associates the Mad Bull, from his great strength and violent temper. Until he was fifteen or sixteen, he was a petty pilferer; but he afterwards aspired to highway robbery outside the barrières. He prospered in this for some time; but having, as it was suspected, shot and killed a merchant, he was forced to fly to England. Returning three years after, he was apprehended and tried for the crime. No direct evidence could be adduced against him, and he was acquitted. He has been involved in any number of personal encounters with his fellow-villains, and has stabbed and shot at least a dozen of them. Generally speaking, they have refused to testify against him, and he has therefore escaped punishment. He is now a house-breaker, and operates so skilfully that the police seldom have an op-

portunity to interfere with him. Some sixteen months ago, he was living at Pantin with his mistress, a young woman of some intelligence and so remarkably handsome that it was strange she could fancy so ill-favored a wretch. Having become jealous of her, they had several boisterous quarrels. One morning she was found in bed with her throat cut from ear to ear, and he had disappeared. He was suspected at once, and publication of the fact was made in the newspapers, whereupon he surrendered himself, and during the examination which followed, several of his accomplices swore that the girl had committed suicide, giving many details that rendered their statements plausible. As his witnesses could not be impeached, he was acquitted, and returned to his old calling. He has frequently been seized by policemen while carrying out some nefarious design, but such has been his strength that he has almost always managed to get away. On one occasion he threw an officer of the law from a fourth story window, and broke his neck. Still nothing could be proved upon him, as no one had witnessed the deed. He must ultimately come to the guillotine, however, as he is growing bolder and bolder in his commission of crime, and more reckless of the means he adopts. Intemperance is telling upon him, as you can see by his bloodshot eye and bloated face.

"The gray-haired man," continued the detective, "laughing so loudly, with a broad scar above his eye, has been in nearly every principal prison in France, and yet has never served out a single term. Professional thief as he is, he does not appear to be very vicious or malignant. He has never been known to do any one bodily harm, and is always as cheerful as he is now. He would not be such a bad-looking fellow except for that scar, and the fracture of his nose, which was caused, some years ago, by his jumping from a wagon conveying him to jail.

"The very dark man, sitting on that bench, and swinging his legs, is a Spaniard. He came here from Madrid, where he had been for some years a bull-fighter, and whence he had to fly for poisoning his father to get a little property.

Poisoning is his specialty, and he is believed to have disposed of a number of persons in that way. Whenever he takes life, he has, of course, a purpose in it, and he has come into possession of a good deal of money by the deaths he has brought about. A greater villain than he probably never breathed: he seems to have no more objection to committing murder than he has to smoking a cigar; and he is known as Pedro the Killer — a nickname of which he is really proud."

"There is a young person I have not noticed before," I said to my companion, pointing to the left. "Who is he? He can't be a thief. He must have gotten into this company by mistake. Is he a gentleman seeking for acquaintance with underground life, like myself?"

The man I had designated could not have been more than twenty. He had a fresh, handsome face, and when he smiled, as he often did, his smile lighted up his countenance as sunshine lights up a landscape. It was hard to associate him with crime or vice of any kind, and hence my question.

The detective laughed, and said, "You mean the Badger. He is one of the greatest scamps in all Paris, and one of the most desperate scoundrels. There is nothing in the world he would not do for money. If I were not here, and anybody were to offer him five francs, he would walk up to you, salute you politely, and blow your brains out, regarding it as a capital joke. The Badger is well educated, and is reputed to be the son of a prominent lawyer by an actress. He ran away from home, and turned thief on instinct. He is absolutely without fear and without conscience. That crime is natural to him is proved by his enjoyment of it. He has had marvellous good luck, for, though frequently arrested, he has never been punished, and the fact of his getting off again and again is ascribed by some to the influence and wealth of his father."

The detective would have told more; but by this time the thieves, all of whom had drunk liberally, began singing a coarse and profane song, in which morality, religion, and decency were burlesqued, and which, rendered by the harsh

voices of the men and women, sounded, in that dreary cellar, like a chorus of infernal fiends.

Informing my guide that I had seen and heard enough, we went out of the stifling cellar, beyond the heavy oaken door, up the narrow stone staircase, reached our calèche, and as the fresh breeze welcomed us, and the clouds overhead broke away, revealing the stars, I seemed to have been transferred to another sphere, and I wondered that such dens of crime could exist and flourish under the beautiful exterior of Paris.

## XXIX.

### THE EAST RIVER BRIDGE.

LAYING THE FOUNDATIONS UNDER WATER. — HOW THE WORK WAS PERFORMED. — THE CAISSON. — HOW IT IS MADE. — ITS MODE OF OPERATION. — WORKING UNDER WATER. — EXPLORING THE BED OF THE RIVER. — DESCENDING INTO THE BOX. — EFFECTS OF A GREAT PRESSURE OF AIR. — AN UNPLEASANT SENSATION. — A STRANGE SIGHT. — ACCIDENTS. — HOW A MAN'S ARM WAS CAUGHT.

A BRIDGE to connect New York and Brooklyn has long been desired, and many plans for such a structure have been made. It was finally determined to erect a suspension bridge high enough to permit the passage of ships beneath it, and stretching, in a single span, from one side to the other of the East River. Work was begun in 1870, and at the present time (1873) is progressing steadily. Two or three years will be required for its completion, and when finished the bridge will be the longest and largest of its kind in the world.

The bridge will rest on two piers, one on the east and the other on the west bank of the river. The eastern pier was begun some time before the other, and the work of laying its foundations was of a peculiar character. Ordinarily, where a pier is to be set in the water, a coffer dam is built around the place where it is to stand, and the water is pumped out. But in the present instance, this mode of working was deemed impracticable, and it was decided to lay the foundations by means of a caisson. This is quite a curiosity in its way, and well deserves a visit and a description. I did not visit the one on the east side, but deferred my caisson explorations till the work on the west side was under way.

On the invitation of Colonel Paine and Engineer Cottingwood, I was one of a party of four to descend into the

THE BROOKLYN SUSPENSION BRIDGE—NOW BUILDING.

Length of River Span . . . 1616 feet.  
 Each Land Span . . . 940 feet.

Length of New York Approach . . . 1441 feet.  
 Brooklyn . . . 941 feet.

Total Length . . . 3698 feet.  
 Total Height above High Tide . . . 266 "

caisson to examine its workings and inspect its machinery. Arriving at the foot of Roosevelt Street, we found indications of the construction of a large building. There were numerous derricks, scaffoldings, and building materials in the vicinity, and everywhere there was activity. Just as we reached the works we found a gang of sixty men indulging in hot coffee, which is always served to them previous to their descending the shaft of the caisson. Their coffee drinking over, and the roll-call answered, they walked in single file to the mouth of the shaft, and there waited the arrival of those whom they were about relieving.

Most of the men wore nothing but their shirts and trousers, with water-proof boots reaching above the knees. At a signal given by the foreman of the gang, some of them entered an elevator, while others proceeded down a spiral staircase, and were soon lost to view. Before taking the reader to the interior of the caisson, it may be well to state that it is nothing else than a large box of iron and wood, the full size of the intended abutment. This box is turned bottom upward, and rests upon its edges.

It is one hundred and two feet wide, and one hundred and seventy-two feet long, and nearly ten feet in height. Its immense weight is supported by several solid trusses of oak and iron, which run across the caisson; and in addition to this, it receives an upward support of forced air equal to forty thousand tons. The pressure of the air in the caisson is forty-four pounds to the square inch, being twenty nine pounds more than the ordinary atmospheric pressure.

The air is sent down the caisson by means of pumps, there being fourteen engines, each of twenty-four horse power, constantly at work. In the centre of the caisson, an entrance is obtained by means of a shaft having a spiral staircase of over one hundred circular steps, and there is another entrance by an elevator, which, by the by, is the most agreeable way of descending, particularly if the visitor is inclined to corpulence.

It was down this entrance I went with the rest of our party.

Like the workmen, each of us swallowed a small quantity of hot coffee and biscuit, as we were told that we should suffer less from the effects of the descent. Under the direction of our guide, we took our stand inside the elevator, for the simple reason that we could not sit. There were no velvet-covered seats, as are generally found in hotel elevators.

At a given signal, we began our journey into the East River, and descended until we reached what our conductor termed the "lock." Here we changed our stands again, and entered the lock by crawling through an opening at the bottom of the elevator sufficiently large for a man of ordinary size to pass easily. This lock is an oblong iron box, or boiler, of just sufficient size to allow half a dozen persons to stand erect. It is eight feet long, and six feet in diameter. At the bottom of the lock there is an iron door or opening, similar to that through which we entered, which gives admission to the interior of the caisson. These iron doors are fitted with rubber, so as to make them perfectly air-tight.

When we had all entered, the door was closed upon us. We looked at each other, wondering what would be done next, and we soon found out. Our conductor, previous to starting the lock, gave us what he termed a few useful hints, so that we might be able to make the trip as agreeable as possible under all the circumstances.

"Now, gentlemen," said he, "in descending, you will find a disagreeable sensation, particularly about your ears. You will find great ease by closing the nostrils every few seconds, — as the pressure of the air will act upon the tympanum of the ear, — and also by inflating your cheeks to their full extent."

These instructions were given that we might cause an artificial pressure upon the inside of the ear, and thus prevent its rupture.

Our conductor then proceeded to turn a cock, to admit the air forced from above. In a moment it rushed in with a tremendous force, making a noise similar to that of a loco-

tive blowing off steam. The effect of this was anything but pleasant. A sudden deafness seemed to overtake us, as if a cannon had been fired under our noses; our voices were also changed, and appeared cracked, and we almost wished our curiosity had not led us so far.

This feeling was caused by the air rushing too fast into the orifice of the car. There was just sufficient light inside the lock to discern our faces, and that was all. It took five or six minutes to get the necessary amount of pressure into the lock, and then the air was turned off.

We seemed suddenly to lose our footing, and then to regain it; and no sooner had we righted ourselves than we had another sudden shoot, and this continued until we reached the bottom. The actual descent was made in about a minute and a half, or perhaps two minutes; but owing to the pain we suffered, it appeared to be three times as long.

The sensation we experienced was certainly very disagreeable and painful, and for a pleasure trip I certainly would not recommend any one to undertake the journey. Should a lady go down, however strong-minded she might be, I would not answer for the consequences. One of the party was so much affected by the pressure of the air that our conductor had to turn off the cock frequently. The stranger's ears pained him greatly, and blood began to spurt from them.

Having reached the bottom of the caisson, where the workmen were digging out the earth and blasting rock, we were detained in the lock some minutes, to allow the admission of air of the same density as that below. This being done, I descended a short iron ladder leading into the bottom of the caisson, and speedily found myself standing on the bed of the river, seventy-eight feet below water-mark.

There were several men working in their shirt sleeves, with big drops of perspiration rolling off their cheeks. The subterranean vault was very well lighted with gas forced down the pipes in the same manner as the air; and it is a curious fact, that in the compressed air a foot burner gives as much light as a four foot one would in the ordinary atmos-

phere. The caisson seemed to be full of steam, as if a hundred washerwomen were plying their avocation at the tub. The bottom of the caisson is divided into several chambers by means of iron and wood partitions, with entrances leading into each other. The air does not seem impure nor unpleasant. According to an examination made a few days before my visit, it was then found to contain a small percentage of carbonic acid, but not enough to do any harm.

As soon as the sand is dug, it is sent up various pipes, four inches in diameter, which operate in the same way as siphons. It is odd to notice with what force the sand ascends to the top of the caisson, and it is all that six men can do to shovel it in fast enough. Boulders of trap rock were found embedded in the quicksand. These were broken up and hoisted out by an apparatus similar to a dredging machine, working in an immense shaft filled with water.

The shape of the interior of the caisson resembles very much the lips of an enormous bell, and in reality it is worked upon the same principle as an ordinary diving-bell, the water being kept out by the great pressure of air. As soon as the caisson is perfectly settled, and all the sand and debris down to the bed rock is removed, the interior is filled with concrete and masonry, and thus the pier obtains a foundation perfectly solid.

While making a tour through the various chambers, I found a pair of doves, which had been placed there for testing the effect of the compressed air. The birds appeared to have become accustomed to their new habitation, where they had been for several weeks. They looked, however, rather disconsolate and sickly, and I learned, a day or two later, that one had died from the effects of its imprisonment.

A black and tan terrier had also been taken into the caisson, but after it had been down a few hours it became paralyzed in its hind legs, and was taken up; and for more than a fortnight it did not recover from the shock to its system.

The scene in the caisson is a very novel one. The water, seen through the gas jets, sparkles in the pools at the bottom of the river, the men are toiling and perspiring amid the rushing and rumbling noise of the sand siphons, and everything appears in confusion. While our party was making its tour, it was found that our voices had completely changed; each one appeared to stutter, and altogether the voice had a very unnatural sound, as if we spoke in a half screeching key.

An attempt was made to whistle, but whistle we could not. The lips might be puckered, and you might blow as hard as you pleased, but it was all in vain, as not a note could be heard. Some of us tried to whistle by our fingers, but were unsuccessful.

Communication is had with the upper-world by means of a movable iron rod and a couple of dials, one above and the other below. These form the telegraph. On each dial are printed, in plain letters, the words, "All right," "Start," "Faster," "Slower," "Stop," "Less," "More," "Bucket is caught," "Highest corner," "Stopped," "Come up all;" and the last is the most pleasing call of the entire number to the laborers below.

Adjoining the dial is a thermometer, which indicated the atmosphere to be eighty-two degrees Fahrenheit.

Accidents occur in the caisson, in spite of all precautions. A short time before my visit, a small stone caught in the pipe of the siphon, and one of the workmen came very near losing his arm while attempting to pull it out. His hand was drawn into the pipe, as if by a powerful magnet. The man was thrown upon his face by the great power of the atmosphere, and at the same time his arm was drawn up the pipe: had it not been for four of his comrades instantly pulling his arm down, the limb would have been torn from his shoulder. He received severe injuries, and is not likely to be so careless again. The skin of the arm looked as if a quantity of boiling oil had been poured over it, and it soon became blistered from his shoulder downward.

After a stay of nearly an hour, the party proceeded to return once more to terra firma. We entered the lock, as on making the descent, through the small iron door; then the compressed air was allowed to escape until the pressure of the air was equal to that of the atmosphere outside.

While this was going on, a peculiar sensation was experienced, but it was not as disagreeable as that of making the descent. It seemed as though there was a rush of water through the ears, and we were diving. Ascending to the top of the caisson occupied about ten minutes, as the physician in attendance recommends that the change from the high pressure should not be made rapidly. We were all glad to breathe the pure air and enjoy daylight again. Several of the workmen stated that nearly every day some of them suffered from the work below, and said one, —

“We have all had the jams.”

“What are the jams?” said I.

“Well,” said another, “they ain’t the jim-jams, brought on by drink, for we dare not take much, but a feeling like the flesh a tearin’ off of our bones.”

“We have the cramps in our legs, body, arms, and chest,” said another, “and at times it causes us so great pain that we cannot work; we do not notice anything amiss until we have been out of the caisson for some hours, sometimes not until the next day. These ‘jams,’ as we call them, go away as quickly as they come, but sometimes return after another visit to the caisson.”

The men are cautioned to abstain from drinking spirits, but with some the caution is not heeded, and those that will drink spirits in preference to coffee are generally the greatest sufferers.

The construction of the abutments of this bridge is a novel one. It was first introduced on the building of the St. Louis suspension bridge, and since then great improvements have taken place. When completed, the bridge will be a noble monument of engineering skill.

## XXX.

### THE UNDERGROUND RAILROAD.

THE DAYS OF SLAVERY. — HOW NEGROES ESCAPE. — TRAVELLING UNDER GROUND. — MODES OF ESCAPE. — BOXED UP AND SHIPPED NORTH. — OTHER MODES OF TRAVEL. — ADVENTURE AT A HOTEL. — SURPRISE OF A PLANTER. — WONDERFUL STORY OF WILLIAM AND ELLEN CRAFT. — BOSTON EXCITEMENTS. — RICH JOKE ON A UNITED STATES MARSHAL.

IN the days of slavery, there existed what was known as the Underground Railroad. It was supposed to be a subterranean route from the South to the North; and its peculiarity was, that travel upon it was only in one direction. People came from the South towards the North by this route, but nobody was ever known to travel in the contrary direction. So much has been said and written about it, and so much mystery was thrown around its operation, that a great many people, especially on the other side of the Atlantic, seriously believed that there was an underground railway line from the Southern States to the Canadian frontier. Several times in Europe I was gravely asked about this line, its mode of operations, and the amount of business it transacted. I believe that at one time a French paper contained an account apparently serious, and evidently the work of somebody who wished to hoax the public, describing the underground route, its stations, the accommodations it furnished, and its various advantages and disadvantages. In the region where my boyhood was passed I know that several persons believed in the existence of an underground route, and wondered why so little was really known about it.

The Underground Railroad was nothing more than an organized plan for assisting runaway slaves in obtaining their freedom, and reaching places of safety.

Thousands of men, women, and children escaped from bondage through its aid. They came from all parts of the South; from the border states, and from the Gulf; from regions where only a few miles separated them from freedom, and from regions where they were obliged to travel hundreds of miles through slave states. Occasionally the papers contained accounts of the travel of these runaways, some of them thrilling and exciting in the extreme. Several instances of the working of the Underground Railroad came to my personal knowledge at a time when publicity was a thing not to be desired. But the events of the last ten or twelve years have made it possible for a man to speak openly and unhesitatingly of the assistance rendered to runaway slaves in escaping from their masters, and making their long and perilous journey to places of safety.

The Anti-slavery Society in various northern cities had a great deal to do with this work. Every member of an anti-slavery society was *de facto* a conductor on the Underground Railroad, and assisted in the superintendence of its business. There are men now living who have personally furnished assistance to hundreds of slaves, while others, more modest, confined their efforts to a few cases. A great many plans were resorted to in assisting the slaves in obtaining freedom. Sometimes a man would be boxed up, and shipped as a package of freight. Sometimes he would conceal himself on board a northward-bound ship or steamer. Sometimes he made his journey by riding on the top of a railway car. Sometimes he disguised himself in woman's dress, and sometimes women were disguised in the clothing of men. Sometimes, through the aid of friends, passes were obtained, some of them genuine, some fictitious, and some forged. Sometimes men and women travelled thousands of miles on foot, making their journeys by night, and concealing themselves by day. Many were the sufferings which they underwent, and many were the dangers which were undergone by those who aided them to escape. Some men for aiding runaway slaves passed years in prison, and several of them died there. The risk of aiding fugitives

was great, and for this risk it was necessary that secrecy should always be observed. The names of many men who did much in the cause of freedom will never be known, though their publication at this day would do no harm.

The northern papers occasionally published accounts of the escape of slaves, but they did not publish them until the slaves had reached places of safety. Where the journeys were short, the runaways, as before stated, were sometimes boxed up and shipped as freight. In many instances, the reason for taking this unusual mode of travel was the fear of being sold, and sent away from family and friends. The auction block had a great deal to do with the labors of the Underground Railroad, just as it had a great deal to do with the overthrow and extinction of the whole system of slavery. Men and women of whatever complexion are decidedly opposed to being sold to the highest bidder, and sent away to distant localities.

In 1859 a merchant of Richmond was selling off his slaves one after the other, when he was short of money, and one of them fearing the auction block, induced a friend to box him up and send him north. He was shipped by steamer to Philadelphia, and directed to a party who knew that he was coming. The box was not large enough to allow him to stretch his limbs, and he suffered great pain during the first part of his journey. His friend was on the dock at the arrival of the steamer, and was ready with a carriage and the proper bill of lading to enable him to secure the property. He had some difficulty in inducing the officers of the boat to deliver freight on a Sunday. Finally the box was obtained, but it proved too large for the carriage. It was necessary to find a wagon, and this took some time. When a wagon was found, the box was placed in it, and taken to a house where it could be opened. The man was found packed in straw, and, no doubt felt greatly relieved when he learned that he was free. He was shut up in the box seventeen long hours, and, as he said afterwards, the hours seemed days.

Another of these travellers in a box was sent by rail, and his

parcel was marked, "This Side up With Care." Holes were bored in various parts of the box to give the man a chance to breathe. The injunction, "This side up with care," was little heeded, as on one occasion he was left an hour or more standing on his head, and when the box was put in its proper position, he was almost dead from a rush of blood to the brain. The package in which he was carried was three feet long, two feet wide, and two feet eight inches in depth. From the time he was shipped until he reached his destination it was twenty-four hours. He said, on his arrival, that he had never been handled more roughly in his life than on that journey; and had he been made of glass, he certainly would have been broken.

The parties to whom he was consigned found it no easy matter to get the box away from the express office. They suspected that the express company would have no sympathy with the anti-slavery business, and so they induced a merchant of their acquaintance, and a warm sympathizer in the cause of freedom, to go to the office and inquire for the package. When the box arrived, a man, ignorant of its contents, was ready to receive it, and take it to the place where it was to be opened. He obeyed the directions given him, and the box was carried to its destination. The door of the room was locked, and the package was opened, the man rose and stepped out, thankful, indeed, that he was released from the suffering which he had undergone in his transportation.

The man who had boxed him in Richmond, and shipped him north, was afterwards arrested and convicted of boxing up two other slaves, and for his efforts in the cause of freedom he passed eight years in the Virginia Penitentiary. He was refused witnesses on his trial, and was kept for five months heavily chained in a small cell.

Runaway slaves were by no means out of danger after crossing the boundary line between the slave and free states. The laws required that a fugitive from labor, escaping from one state into another, should be given up on a proper demand for him; but when slaves were voluntarily brought into a free state, the case was different. Slave-owners some-

times ventured to bring their property north, trusting that the kind treatment the negroes had always received would prevent their leaving. In many instances their trust in the fidelity of the negroes was well founded, but at other times it was not so.

About 1856 a South Carolina planter, making a journey north, accompanied by his family, concluded to bring some of his slaves with him as body servants. He had a faithful manservant, and his wife had an equally faithful maid.

The negroes had solemnly promised that they would never leave master or mistress so long as they lived; but at the hotel where they stopped in New York, some of the colored servants entered into conversation with them, and urged them to escape.

They told them that they were at perfect liberty to run away; their owner had voluntarily brought them into a free state, and he could not carry them away if they refused to go. Their new friends offered to find them homes and employment, and after a little talk upon the subject, the slaves determined to make a step for their freedom.

While the master and mistress were sleeping, the two slaves were quietly slipped out of the house, and taken to a place of seclusion.

In the morning the master awoke, and sent for John. John was nowhere to be found. The house was searched from top to bottom, but John had disappeared.

The proprietor of the hotel was highly indignant, as there was danger of his losing the custom, not only of these patrons, but of many other southerners. If it were published in the southern papers that this hotel was the resort of abolitionists, or that a man's property in human flesh could be stolen from him in this house, southerners would refuse to come here.

The proprietor summoned his servants, and threatened all of them with discharge and punishment if they did not instantly tell what they knew about the escape of the slaves. Half a dozen of the hotel servants were in the secret, but so well did they pretend ignorance, that the hotel keeper was

deceived, and at length he became satisfied that his servants were innocent.

He next settled upon an innocent-looking clergyman from one of the New England States as the culprit. He had seen the clergyman speaking to John the day before, and was satisfied that he knew something about what had become of the runaways. The clergyman knew nothing whatever of the affair, and was particularly horrified, as he happened to be one of the few Massachusetts members of his profession who believed in slavery and its divine character. After a good deal of searching, and an equal amount of profanity, the effort to find the two runaways was abandoned. The slaveholder left the hotel, determined never again to enter it.

Twelve years later, on making a journey north, he stopped at a hotel where all the servants, including the head waiter, were of Ethiopian descent. The servants of the house were thorough and efficient. The southerner was greatly pleased with the attention he received, especially from the head waiter. At the table, after his first visit to the dining-room, he found a place always reserved for him; and whenever he called for anything it was immediately served, and was of the best character. He offered the head waiter a gold piece, which the latter politely declined, much to the surprise of the southerner.

The southerner urged the negro to take it, but the latter refused, saying, "I don't think I ought to take your money, Mr. ———; you used to treat me so kindly, that I do not think I should accept the gold piece. I feel very grateful to you for bringing me north, where I could get into such good business."

"Is that you, John?" said the southerner.

"Yes, it's me, master. After you brought me here, I went to work in a restaurant, and have finally got to be head waiter. I did well. I am married, and have three thousand dollars in the bank."

The master was at first enraged, but finally concluded to make the best of the joke, and say nothing more about it.

An old lady of my acquaintance was once a conductor on the Underground Railroad, and, since the abolition of slavery, she has told me some of her experience. She lived for a time in a southern city, and one of the servants in the house had a great anxiety to get away to the north. So this lady, whom I will call Mrs. Smith, determined to assist her.

Finding a man who was going north, and whose interest in the cause of freedom was as strong as her own, she enlisted his sympathy and obtained the promise of his aid. The journey was a difficult one, and full of danger. Mary, the girl, was a mulatto, and it was determined to take her away in the disguise of a boy.

A suit of clothes that would fit her was found. At an appointed time she left her house secretly, and proceeded to a place in the edge of the city, where the man who was to be her guide was waiting to receive her. Here she was encased in her boy's garments and instructed in her new duties. She was to look after the baggage and make herself generally useful. Her name, which was Mary, must, of course, be dropped, and she was thenceforward to be called Peter. To carry out the deception as well as possible, her new master was to be very severe with her, or, as we may say, with him.

A part of the journey was performed by rail. Every little while Peter's master wanted something, but he generally concluded, after giving the order, that he didn't want it, and would tell Peter to stay where he was. From the railway train Peter and his master proceeded on board a steamboat. There was great fear that the sex of the "boy" would be discovered. It would not answer to take Peter into the cabin, and so he was ordered to stay on the lower deck; but of course there was danger of discovery among the negroes and deck hands of the steamboat.

The master quietly whispered to Peter, when there was an opportunity, and said, "I will come down in a few minutes, and call you; keep out of my way until I have called four or five times, and can get very angry."

Peter obeyed orders. The master came down and shouted several times for his servant, but no servant was at hand.

Again and again he called, each time growing more and more angry. Finally Peter made his appearance, and his master threatened to cut his black heart out, cut his back up with a raw hide, and do other things the reverse of pleasant. In apparent rage he asked the mate of the steamer if there was a place where he could shut up the nigger alone. He wanted to punish him, and was determined to have him where he could find him.

There was a little closet or storeroom for odds and ends near the carpenter's shop, and the mate indicated that as the proper place to shut up the nigger. Peter was taken by the collar and forced into this place, and the key was turned upon him. His master put the key into his pocket, and walked up stairs, apparently greatly satisfied at having secured the negro.

His satisfaction was real — much more so than his anger, which led him to incarcerate his so-called servant. The negro was kept there until the steamer reached its destination.

The rest of the journey was comparatively easy, as the steamer landed them in a free state, where there was less danger of detection and capture. Peter dropped his boy's clothing, and assumed that of a woman. The fugitive was no longer Peter, but Mary.

On one occasion a man and his wife ran away under peculiar circumstances. Their names were William and Ellen Craft. The woman was nearly white, so nearly so that she could easily pass for a white person. They were slaves in the state of Georgia; and they laid their own plans, and confided them to nobody. They concluded that the best way to make the journey would be to have one act as servant to the other. It was determined to transform Ellen into a young planter, dressing her in male clothing fashionably cut, covering her eyes with green spectacles, and making her a little lame, so that she could carry a cane in her left hand. She was to be very hard of hearing, and consequently leave everything to be attended to by her servant. William was to be con-

stantly in attendance upon his young master, and the two were to pay very little attention to anybody else than themselves.

While they were making their plans, it occurred to them that Ellen's chin, as she was to represent a young planter, ought to have some beard upon it. They got over this difficulty by tying up her face, and having her complain often of the toothache. Then there was another trouble. She could not write, and she would be expected to register their names on arrival at the hotels. They got around this by tying up her right arm as if it were lame. With a lame arm and a severe toothache, and being very hard of hearing, it was no wonder that the young planter needed plenty of attention, which his faithful servant was willing to give. It was arranged that whenever any one, during their journey, spoke to the planter, he was to pay no attention; while William was to explain that his master was very hard of hearing. Of course that would relieve Ellen from the attentions which she was desirous of avoiding.

They managed to obtain the desired clothing, and made up their disguise. The servant attended to everything, and they stopped over night at a first-class hotel in Charleston, where they were treated with the respect due to their supposed position. The same was the case at the other hotels, and also at Baltimore.

At Baltimore they had some trouble in obtaining tickets to go north. The servant asked for tickets for his master and himself. The ticket-seller told him that of course his master could have a ticket, but the negro must give bonds before he could obtain one. It was the rule of the office, he explained, to require a bond before selling tickets to negroes going north.

The servant replied that he knew nothing about that, that he was only travelling with his master, who was in very bad health, and was going north to get medical advice. He wanted to reach Philadelphia as soon as possible, and his master must not be detained.

The ticket-seller was convinced that all was right, waived the rule, and sold the tickets. In a few hours they were in Philadelphia, and as soon as they arrived there the rheumatism departed, also the deafness, also the lameness in the arm, also the toothache. The young planter was transformed into a woman, and assumed the proper dress.

From Philadelphia they went to Boston. Their story was published far and wide, and is doubtless known to thousands of people. They lived there for some time, until the passage of the Fugitive Slave Bill, when efforts were made to arrest them and take them back to Georgia. In October, 1850, warrants for their arrest were issued; but at first nobody could be found to serve them. The man who came in pursuit of them was arrested on a charge of conspiracy, and was immediately bailed. He was afterwards rearrested on a charge of conspiracy to kidnap William Craft, a citizen of Massachusetts. Meetings of the colored people were called, every effort was made to resist their return to slavery, and so much excitement was created that the slave-hunters ran away from Boston.

It was not very safe for William and Ellen Craft to remain in Boston after that, and so they went to England. They were several times at the Great Exhibition of 1851, and remained in England until after the passage and ratification of the Fifteenth Amendment. Then they returned to the United States. William longed to visit Georgia, and buy a plantation near the home of his youth. He bought a plantation near Savannah, and I believe he is now living there with his family.

Many stories might be told about the workings of the Underground Railroad, but I have space only for a few. How many thousands of negroes escaped from slavery and found homes in the north is not exactly known, as it was not advisable, during the time the Railroad was in operation, to keep any statistics. Many of the fugitives settled in the Northern States, and others went to Canada; some of those who were scattered through the north have gone south again,

to engage in business. I am told that fifty or more plantations in Alabama have been purchased by men who were originally runaway slaves, and have now returned to the land of their birth. They have become proprietors of the soil, and employers of laboring men.

After the passage of the Fugitive Slave Bill in 1850, quite a number of slaves, who had run away, were arrested and taken back to the south. Others were obliged to flee to Canada, and seek the protection of the British flag. A great excitement was aroused, in some parts of the north, over the efforts of United States officials to arrest and return run-aways.

Boston was the scene of several excitements, some of them of a riotous character. On one occasion the military was called out, and all the power of the government was brought into requisition to enforce the laws. Open resistance was advocated, and Faneuil Hall was surrounded with chains to protect it from attack. The arrested fugitive was marched, under a strong guard, to the wharf, where he was put on board a ship bound for Charleston. A rescue had been planned, but the guard was so strong that the attempt was not made. The ship was towed into the lower bay, and there came to anchor, on account of adverse winds. So great was the determination to rescue the prisoner, that a plan was made to proceed down the bay in a steamboat and attack the ship; but it was not carried out.

Sometimes the United States marshals were made the victims of practical jokes when attempting to execute the laws. A joke of this kind came to my knowledge in one of the New England States. A newly appointed marshal was very zealous in the performance of his duty, and was constantly on the lookout for runaway slaves. One day some of the jokers persuaded an intemperate vagabond, in consideration of three dollars and a bottle of rum, to act the part of a fugitive from labor.

The vagabond, whose name might have been Jones, was taken to a swamp, a mile or so from town. His face and hands

were well blackened with soot, mixed with alder juice, and as his hair had not been combed for a few years, he made a very good imitation of a dilapidated negro. A small bower of bushes was built up to conceal him, and he was left there, with a bottle of rum, and strict orders not to move. When the marshal approached him he was to attempt to get away; but it was understood that he should not go far before surrendering. This was a useful precaution, lest the marshal, in his zeal, might fire upon the man.

When the trap was all set, an individual, whose proclivities were known to be of a pro-slavery character, but who was always ready for a joke, approached the marshal, and informed him that he knew where a runaway nigger was concealed.

The marshal was roused at once. Here was a chance for glory. Here was an opportunity to execute the laws—to make himself a name, and to obtain a reward. Accordingly, he asked to be directed to the place of concealment.

The informer refused to move, unless he first received five dollars as the price of his services, promising to return the money if the negro should not be found. Under this stipulation the marshal gave him the cash, and they proceeded to the work.

The negro might resist, and so it was thought best to make up a posse of half a dozen men. Some of them were particular friends of the marshal, and did not know the joke that was being played; but the most of the party were in the secret, or were let into it on the way.

Meantime Jones and his rum bottle were having a good time, and becoming very intimate. Jones was thirsty, and the mouth of the bottle was large. The result was, that before the marshal arrived Jones had finished the bottle, and was as drunk as an owl. The marshal was directed to the bower which had been shaded for him. As he approached it, he saw the form of a man laying prostrate on the earth.

"In the name of the law," said he, "I call upon you to surrender."

Jones raised himself on one leg, and attempted to carry out

his part of the agreement by leaving the bower, and attempting to rush into the bushes; but the rum was too much for him. He rose partly to his feet, and then staggered and fell, muttering something about the nigger business, and the infernal abolition.

In an instant the marshal was upon him. He seized the counterfeit negro, tried to raise him, and found he was drunk. He released his hold from his collar, and, in doing so, he observed that the complexion of the darky's neck had rubbed off upon his hand. The neck was white in strips, and the hand of the marshal was of a deep black.

A yell of laughter arose from the assembled posse. As the marshal walked away from his victim, he threatened to shoot the informer who had told him where the counterfeit negro was concealed; but the informer had placed himself at a safe distance, and was not willing to be shot just then, any how.

They gathered about the marshal, and persuaded him not to take the matter to heart. They told him that he had exhibited praiseworthy zeal in executing the laws, and if he would stand treat handsomely on their return to town, they would say nothing more about it. He consented, and the matter was hushed up, or rather it would have been hushed, had not the vagabond Jones told it repeatedly whenever rum obtained possession of his tongue and brain, which was as often as he could raise sufficient money to buy a quart of the stuff, or could induce some of his friends to pay for his drinks.

## XXXI.

### WAR AND PRISON ADVENTURES.

EXPERIENCES OF AN ARMY CORRESPONDENT. — RUNNING THE BATTERIES OF VICKSBURG. — EXCITING SCENES. — PERILOUS SITUATION AND HAIR-BREADTH ESCAPE. — SHOT, SHELL, STEAM, FIRE, AND WATER. — TWO YEARS AS A CAPTIVE. — TUNNELLING. — ITS MODE, MANAGEMENT, AND MISHAPS. — TOILING FOR FREEDOM UNDER GROUND. — BOLD AND PROSPEROUS EFFORTS FOR LIBERTY. — LIFE IN A DUNGEON. — PERISHING BY INCHES. — DEATH ON EVERY HAND. — SUBTERRANEAN SEEKING FOR THE LIGHT. — SELF-DELIVERANCE AT LAST.

WHEN I was a small boy, and fed my miniature mind with thrilling accounts of the adventures of famous men, of their incarceration in prison, and of their escapes, I had no expectation of one day sharing in experiences of a very similar character. I can understand now why I felt so much interest in the biographies of Baron Trenck, Walter Raleigh, Cervantes, Silvio Pellico, and other noted personages who had spent much of their life in confinement. I little dreamed then that I should be for two years a prisoner, and last of all a prisoner in my own country, held by my own countrymen.

As may be supposed, the fortunes of war — our Great Rebellion — proved adverse to me, and I became the occupant of no less than eight different southern prisons.

The way I chanced to fall into the enemy's hands was this. Having been a war correspondent for twice a twelvemonth, and having learned, under a variety of circumstances, how it feels to be shot at, and what the feeling is of just escaping death, I had a curiosity to enjoy the sensation of running the formidable batteries of Vicksburg during the spring of 1863. I communicated my intention to two of my companions, and they said that they would go with me. We were at Young's Point, Louisiana, whence the army had already begun to move,

by land to New Carthage, designing to cross the Mississippi River there, and attack Vicksburg in the rear. A number of gunboats and several transports had already run the batteries, and on none of these had I been able to obtain permission to go. Just at this time, another expedition, consisting of two large barges loaded with provisions, and bound to a steam-tug, was fitting out, and almost ready to start. Running the batteries was considered extremely perilous—so much so that the soldiers accompanying the transports, instead of being ordered to that duty, were allowed to obey their own inclination. The custom was for the officers of the regiments to announce that so many privates were needed, and that those who wished to take the risk would step forward.

The special expedition in which we military journalists were concerned was deemed an unusually dangerous one, for the reason that the river had then fallen, and there was considerable probability that the boats might get aground in front of the great guns, and be shot to pieces. Moreover, the moon was at the full, and at the hour of our starting—a little after midnight—would be in the very zenith of the heavens. The other vessels had gone down on dark and stormy nights, when they could hardly be seen from the Mississippi shore, and when the probability of their being struck was very small. Several old south-western pilots advised me not to try the experiment; for, if I did, the chances were twenty to one against my coming out alive. "I know the river," one said, "and the state it is in just now. Besides, those two big barges will be so clumsy, hitched to that little tug, that they'll be dead sure to stick on that bar opposite Vicksburg, and then you boys'll have a lively time. The rebs will riddle you from stem to stern, and there won't be a Yankee left to tell the tale."

I laughed at this gloomy picture, quoting, "The gods take care of Cato." The pilots, who had never read Cato, or even heard of Addison, replied in their literal way that they didn't know my name was Cato, and that they were sure there was no such steamboat on the river.

The night we cast off our lines and floated down the Mississippi on our eventful expedition was as lovely a night as I have ever seen in any part of the world. The sky was without a cloud; the air was deliciously soft, and the heavens were so bright that we could read the newspapers without the slightest difficulty. There were thirty-five of us in all, including some twenty enlisted men, who had volunteered to go along in order to resist the enemy, if our vessels should be disabled and boarded. Never was any expedition worse prepared. The two barges were laden with barrels of pork and boxes of army bread, and on the top were bales of hay. The hay, which was extremely dry, was scattered all over, so that a spark — not to speak of a bursting shell — might ignite it in a moment, and so destroy our vessels inevitably. In addition to this, we had not a bucket on board, in the likely event of fire; nor had we a single small boat to get away with, should the flames master us. Still, all being volunteers, none of us were obliged to go unless we wished, and, as we said, the greater the danger, the greater the sensation, and the more we should enjoy its memory, provided we were fortunate enough to escape. It is due to the prudence of Captain ———, who fitted out the expedition in such an admirably reckless manner, to say that he did not intend to accompany us.

We had about five miles to run before reaching the batteries. There is a sharp bend in the river just above Vicksburg, caused by a tongue of land or peninsula on the Louisiana side. This peninsula had been covered with trees; but the rebels had cut them down, so that their guns had full sweep across it, and could command any and all vessels descending the stream when they were nearly three miles above the batteries. We floated at first, knowing that the puff of steam from the tug could be heard at a long distance in the midnight silence, and would necessarily attract the attention of the enemy. The first twenty minutes were passed quite pleasantly. We opened a bottle of wine, and drank to the success of our adventure, lighted our cigars,

and chatted upon the possibilities of the situation. Thinking disaster might befall us, we tore up the few private letters we had in our pockets, and indulged in all kinds of jests respecting the potentiality of the result.

We had scarcely reached the bend of the Mississippi, when we saw a flash from the hostile guns, heard the boom, and felt that the outer barge was struck. We thought that to be hit by the first shot was pretty good to begin with. Knowing, too, that we should be nearly three quarters of an hour under fire, — most of the time immediately in front of the batteries, — our prospects of a happy issue to our expedition were far from brilliant. There being no further use in attempting to steal on the foe, the engineer of the tug set the engine in motion. Our progress, hampered by the huge barges, was necessarily slow — very little greater than that of the current.

The initial gun was followed by a hundred others. For several miles along the Mississippi shore, the batteries belched forth shot and shell, until the bank of the river seemed all ablaze. Those who went for excitement certainly found it. The roar of the guns — some of the largest calibre — was almost deafening. The round shot howled over our heads; the shells shrieked fiercely and then exploded, many of them just above the barges. We could hear fragments falling about us, and it appeared as if the shot, so thick did they come, sometimes grazed our hair and our whiskers. As a pyrotechnic exhibition, it was splendid, and we should have enjoyed it greatly, had we not heard in the brief intervals of the cannonading the groans of the poor fellows who had been struck.

Such a situation is certainly a strong test of courage, which frequently quails in an entire state of placidity, when it would not blanch before the deadliest peril, could it be actively met. All we had to do — all, indeed, we could do — was to stand and take it. There was no possibility of shrinking or retreating, even had we been so inclined. We were precisely in the position of a regiment under a galling fire, and ordered not to move or return a single shot. Boom, bang, boom! whiz, yship, hursh! roar, crack, shriek!

Such were the indescribable sounds that greeted and surrounded us for fully forty minutes, and you may be sure the minutes were not short.

The whole night was radiant with flashing artillery and bursting shells. The brightness of the moon and stars was quite eclipsed; they looked dim and yellow through the blaze and smoke of war. The barges were struck again and again, and so were the bales of hay; but still the boats were not materially injured, and we could plainly hear the puff, puff, puff, of the tug, doing its best to carry along the great burden to which it was tied.

My two journalistic friends and myself were side by side, watching the exhibition with an interest that might be called personal. We were not excited, as we had supposed we should be, owing, no doubt, to the fact that we had had two years' experience in the field. And yet we were forced to admit that it was about the liveliest experience under fire which we had ever enjoyed. I presume that our nerves were at a higher tension than we suspected, though we talked very glibly, and discussed the probability of our getting through, albeit much of what we said was lost in the infernal din.

What the French call the fire of hell was unremittingly kept up. A hundred guns seemed to explode, and a hundred shells to burst, every second. We suggested that the so-called Confederacy would soon expend all its ammunition, if it long continued such a tremendous cannonading; but then we remembered that long before it could be exhausted, we should be in a condition to know or care very little about it.

Under such circumstances, men who have any coolness, or inclination to speculate, are very apt to become fatalists, irrational as fatalism is.

"I don't believe," said one of my companions, "that I am destined to die here." And the other remarked, "If my time has come, it might as well be here as anywhere else."

Our speculations were cut short by an explosion, not so

loud as, and altogether different from, any other that had taken place; and almost at the same instant there was a rush of steam, with a great deluge of live coals and cinders all about us. "What the devil is the matter now?" asked one correspondent. "This seems to be a new sensation!" exclaimed the second; while I solved the mystery by declaring that the boiler of the tug had exploded.

That I was right, was proved by the immediate cessation of the regular puff, puff, puff. A large shell had fallen upon the little steamer, and, bursting, a fragment had penetrated the boiler, causing the explosion, and throwing the fires of the furnace upon the dry hay covering the upper part of the barges. The loose hay caught at once. We ran to extinguish it; but our effort was vain. The fire blazed up before and behind us, and not having any means of putting it out, we abandoned further endeavor. On looking around, we discovered that a number of the soldiers, and those of the crew of the tug who had not been killed outright, were very severely scalded. Others, as we knew, had been badly wounded by shot and shell. At least half of the thirty-five men with whom we had set out were either dead or badly hurt, and our first thought was to help the poor fellows that could not help themselves.

Those who were sound began pushing the bales of hay into the river, and putting the wounded upon them. The barges burned like tinder, and in a few minutes after they had been ignited, two thirds of them were wrapped in flames. The rebels, strangely unmindful of their much boasted chivalry, continued their fire, though they must have seen that our expedition was utterly wrecked. Having gotten off the wounded, we who were unharmed jumped overboard, and secured a bale apiece, designing to float down the river beyond the city, and then those of us who were expert swimmers, at least, strike out for the Louisiana shore, and try to get back to our camp at Young's Point.

Alas for the vanity of human expectation! One of my journalistic associates and myself had arranged this programme

to our satisfaction, when, hearing the sound of rowlocks, we knew the enemy must be out in small boats to capture the survivors of our ill-fated expedition. Consequently we left our bales, and floated,—nothing but our faces out of the water,—believing that by so doing, we should remain unnoticed. We had not floated quite a minute before a yawl, filled with armed men, was rowed up to us, and we were seized and drawn into the boat, with the remark from a rebel captain, “We will get you d——d Yankees once in a while.”

We did not like our capture, but we took it good-naturedly, though it seemed rather hard that, after escaping shot, shell, steam, fire, and water, we should have the bad luck to fall into the enemy's hands.

The old pilot had proved a prophet. There was not a single Yankee left to tell the tale. The expedition was reported a total loss, with all on board, and some of us had the pleasure, long after, of reading our own obituaries in the northern journals. They were very kind; so kind, indeed, that we had some hesitation in declaring ourselves alive, lest, when we should really shuffle off this mortal coil, we might not be spoken of so generously. General Sherman, who then had, and may still have, a tender affection for war journalists, expressed his sympathy that night with our reported death by saying, “We shall have despatches from h—l now before breakfast.”

Even we correspondents, who had had glowing visions of the highly rhetorical accounts that we had intended to furnish to the New York journals, were deprived of the privilege of putting a word on paper. Our career of imprisonment began, and a very dreary career it was. We were thrust into two places of incarceration in Vicksburg; were then transferred to Jackson; then to Selma; then to Atlanta; then to Richmond, and finally to Salisbury; having in that time been the inmates, as I have said, of eight different prisons, each one of which was, if possible, more repulsive than that immediately preceding.

At the famous Libby Prison we made our earliest efforts to

escape; for at the other places we had not remained long enough to perfect any plans for freedom. We all had more faith in tunnelling than in anything else; but being kept on the upper floors of the old tobacco house in Richmond, we had no opportunity to put our faith into the form of works. If we could only have tunnelled the air, we should have come out in the camp of the army of the Potomac before we had spent a month in the Libby.

Numerous efforts were made by the Union officers, while we were with them, to have their quarters changed to the ground floor, on the score of comfort; but their southern keepers were too shrewd to put them there, knowing full well that the prospect of escape by tunnelling would be vastly increased. The northern invaders, as they were denominated, could get down to one of the lower floors, a few at a time; but these were not enough to do the digging, and the other hard work required, within any safe period. They did not, however, surrender their plans, and frequently at night we used to discuss at length the most available means for securing our freedom.

Months after, when one of my fellow-scribes and myself (the second had been duly exchanged at Richmond) had been sent farther south as "hostages for the good conduct of the Washington government," we were delighted to learn that the gallant officers we had left behind in Libby had at last succeeded in digging the long-contemplated tunnel, and, what was better, getting their liberty once more.

The ground floor in the most western of the three adjoining warehouses composing the Libby Prison was devoted, during the winter of 1863-4, to storage and lumber, and was seldom visited by the rebel officials. This was very fortunate for the Yankees, who had been prevented before from commencing operations in that quarter, in consequence of the occupation of the floor by some of the southern subordinates. As soon as the prisoners learned that they could operate to advantage, they sawed a hole through the floor of the second story, carefully concealing it by the piece of plank they had sawed out.

This story was part of their quarters, and they could readily determine when the coast was clear, and let down some of their number, who were not long in removing enough of the first floor to begin their digging. They worked like beavers, relieving each other every two hours, and performing all their labor at night. They began their tunnel just inside of the outer wall, went below the foundation of the building, and then dug laterally to a point where they deemed it safe to come up.

I have had so much experience in tunnels that I regard myself as an authority thereon. They are generally only large enough to admit the body of a good-sized man, who creeps into them, and, lying nearly flat, digs as hard as he can with any instrument he may procure. After the tunnel has been extended thirty or forty feet, lack of ventilation prevents the burning of lights, and anything like freedom of breathing. The Libby tunnel was some seventy feet long; and to remedy this defect, the officers made a large pair of bellows, much resembling those used by blacksmiths, with tacks, blankets, and boards. With this rude but ingenious instrument, they supplied with oxygen the two men employed in the tunnel, one in advance digging, and the other behind, carrying out, or rather backing out, with the dirt in a haversack. Progress, under such adverse circumstances, is necessarily slow, the digging generally being done with a pocket or case knife. Sometimes not more than two feet is made by twelve hours of hard labor, and no one works more than an hour at a time, as the foul air is very exhausting.

The Libby tunnel was not completed in less than a month, the officers being in constant dread lest it should be discovered. But it was not even suspected, and on a certain morning everything was pronounced ready for the test of its practical availability. Those who had done the most work and been the longest in confinement had precedence. About ten o'clock the prisoners began crawling into the tunnel one by one, while the entire number, including those who had no expectations of freedom, lay anxiously awake, awaiting the

OUR QUARTERS IN LIBBY PRISON.

result of the undertaking. When daylight came, nearly a hundred and twenty, if I remember rightly, had gotten out; after that hour all further attempt had to be abandoned. A few poor fellows in the mouth of the tunnel were obliged to creep back and surrender the prospect of freedom for which they had so earnestly longed.

At the Libby, as in most prisons, the roll was called and the men counted every morning and evening, for the purpose, of course, of seeing if anybody had escaped. That particular morning at the Libby, the absence of the one hundred and twenty rendered the existence of a tunnel so highly probable that the rebels at once set about finding it, and in less than an hour they succeeded. They were angry enough, especially as one of the missing was Colonel A. D. Streight, who had been captured with a number of his men on a raid into Georgia, and whom the rebels so cordially detested, that they refused to exchange him, or the officers with him, thus interrupting the cartel until nearly the close of the war. I knew Streight very well in captivity, — he fell into the enemy's hands in Georgia on the same date that I had a similar fortune in front of Vicksburg, — and I was rejoiced at his getting away, because his foes were so anxious to retain him.

The officers who escaped had a very severe experience. Long confinement and wretched food, not to speak of the poisoned air they had breathed, had rendered them weak and incapacitated for exertion. They had not more than seventy-five miles to go to reach our camp, but many of them could not march, others lost their way, and others again lacked the nerve and will to push steadily on. At least half of them were retaken, and those who arrived within our lines were in a pitiable condition. They had suffered from want of food and shelter; were excessively fatigued, and so foot-sore that in numerous instances their toe-nails came off, and they were unable to walk any distance for weeks after.

The second prison in Richmond to which we were consigned was the notorious Castle Thunder. There was no more opportunity for digging tunnels there than there had been at the

Libby ; and yet we had, if not expectations of escape, a settled determination to employ every possible means in our power. We plotted and plotted by night and by day ; had secret communications with Unionists in Richmond ; had rendezvous appointed in the event of our getting out ; had the guards bribed ; had our programme fully arranged ; indeed, had everything complete except our escape. The fault certainly was not ours ; for prisoners were never more prudent, never more watchful, never worked harder than we. Fate seemed to be against us. There was always a hitch, a tangle, a broken link, for which we were not in any way responsible. Having three of the guards properly bribed, one of them on the particular night when we intended to get out would inevitably become intoxicated ; some agent whom we had trusted for a certain emergency would fall ill ; a highly important message would miscarry at the critical moment ; and thus were we cheated of our exertion and enterprise so repeatedly that it is singular we did not despair altogether.

We were betrayed once by a contemptible Marylander, who, himself a prisoner, and pretending to be excessively loyal, imparted to the authorities what he had suspected, in the hope of gaining their favor. The result was, that we were thrust into a noisome dungeon, and kept there for two weeks, with half a dozen deserters from the rebel army, who had varied their military life by forgery, burglary, and assassination. Having been returned to our old quarters, and having just formed a new project for emancipation, which we felt assured would fulfil its purpose, we were ordered off to Salisbury.

I remember that three or four desperate rebels in the condemned cell adjoining the apartment in which we were confined, freed themselves in an audacious manner, that entitled them to my admiration. They sawed through the floor, keeping up such a rattling of their chains while at work, that nobody could hear them, got down to the first floor, seized each a loaded musket from one of the racks, dashed out of the front entrance, shot one of the sentinels through the head,

knocked another down with the butt of a gun, ran by the third, and disappeared in the darkness. The third sentinel fired his piece after them, and a general alarm was given; but, in spite of the fact that the Castle was in a much frequented part of the city, the bold fugitives got clearly away, and were never seen after in Richmond. They deserved a prosperous issue for their reckless courage; but there was something of luck in it, and I doubt, had I made the same attempt, if I should have been able to reach the outer door.

At Salisbury we were kept like cattle (except that we were not nearly so well treated), in a large enclosure, sleeping, or rather lying down, in an old building formerly used as a cotton factory. This building, with a number of miserable out-houses, was employed as the prison quarters, until some thousands of enlisted Union men were sent down there, when a system of freezing, starving, and murder seemed to be deliberately established by the rebel commandant.

Things soon became so bad that they could hardly get worse. It was death to remain, and even if an attempt to escape proved to be death also, we thought we should have the satisfaction of dying in an effort to obtain freedom, instead of perishing like rats in a hole.

Salisbury was the most hideous prison-pen, not even excepting Andersonville, in the entire South. Its one redeeming feature was, that it was not without facilities for tunneling. These did not amount to a great deal, for the reason that we had spies in camp; the captives being made up of deserters from both armies, professional ruffians, and miscreants of every sort. Moreover, so intense was the suffering that not a few men, naturally loyal, but not of heroic stuff, could not resist the temptation to treachery, when they knew that their treachery would be rewarded by the food and raiment for the want of which they were perishing.

Tunnels were digging constantly, and were as constantly failing for the reasons I have mentioned. As my friend and myself were the only war correspondents at Salisbury, we were individualized to our fellow-captives, and having been

longer in prison than anybody else, they were not only willing, but glad, to do anything which would aid us to escape. Consequently, we were informed of any and all plans, and given an interest in every tunnel that was projected, begun, or partially constructed. After one had fairly gotten under way, we would be invited to, and we would, examine it. Creeping on our hands and knees through its length, and then retreating in the fashion of a crab, we would pronounce the tunnel good, with the simultaneous instinct that it could not long remain undiscovered after we had made its acquaintance.

No wonder we often thought we were destined to breathe our last in durance vile. Every scheme, contrivance, or device for our deliverance appeared doomed to an untimely nipping. I can recall a dozen occasions when I entered tunnels in the evening just ready to be tapped, and through which I intended the next night to take my departure. The first thing I would learn, the following morning, would be, that somebody had turned informer, and that we must have recourse to still another enterprise.

I never did much work myself. I was as willing as Barkis; but I had little skill in that species of practical engineering, and was so much excelled by my companions in captivity that I did not insist on performing my share of the labor. So many of our tunnels had exploded, as we used to style it, that the authorities put on double lines of sentinels, compelling us to carry a tunnel so far that the obtainment of oxygen became impossible. Sixty or seventy feet, or even eighty or ninety, may be managed; but one hundred and forty or fifty feet cannot be accomplished without a ventilating apparatus, and at Salisbury we were absolutely without implements of any kind. It was quite common there for our custodians to draw us up in a line, and compel us to surrender, not only our valuables, on pretence that we might bribe the guards, but also our pocket knives, and anything that might in any way aid us in our liberation. Old scraps of iron, and whatever might be converted into a sharp instrument, were, therefore, in active demand, and the supply entirely inadequate. I

recollect that I was hailed with joy, on a certain afternoon, when I exhibited an ancient case-knife that I had contrived to conceal, and which not the neediest rag-picker in Paris could be persuaded to throw into his basket.

How the poor unfortunates at Salisbury did toil at tunnels, and how perverse fortune always proved! I make no question that scores of the captives, at the rate of three dollars a day, would have earned hundreds of dollars each in digging, and all, alas! to no purpose. The fabled industry of the Trojans was not to be compared to theirs. No sooner was one tunnel discovered than they set about making another, and when that blew up, they turned to a third, and a fourth, and a fifth, and a sixth, as if they were incapable of discouragement. Hope springs eternal in the human breast, especially when the human breast is famishing by slow degrees, and freedom smiles never so faintly in the far-off distance.

If there be any severer labor than tunnelling, I am unacquainted with it. The first time I became a digger was on a hot summer day. Armed with an ordinary jack-knife, the blade of which was broken, I attacked the firm earth, and, for nearly two hours and a half, strove, like Hercules, against one of the original elements. The work would have been nothing in the open air, even with the noonday sun blazing down; but in that narrow, underground channel, where half a respiration was impossible, every movement of the muscles, every throb of the pulses, every beat of the heart, resembled a spasm, and the slightest exertion appeared like the greatest. The perspiration started from all my pores, my head ached, my lungs grew painful, my breath became hot and stertorous. The man behind me, who was engaged in removing the dirt, insisted on my stopping, saying that I was overworking, and that an hour at a time was quite as much as anybody ought to endure.

I would not heed him. My opposition was aroused, the spirit of the perverse was prompting me. I had determined to stay there and toil as long as I could move my hands, or

catch a breath. I went beyond my resolution. I dug and dug, and after a while the sense of semi-suffocation and the pain in my breast seemed to cease. My head appeared to be on fire; the little candle I had before me shone as a calcium light. I fancied that I was inspired, that I could never be fatigued, and I wrought feverishly, but effectually, until my assistant wondered at the amount of earth he was obliged to carry off. I imagined that hours and days had passed. While I was delving energetically, though wildly, I lost consciousness, and chaos and oblivion came. I knew nothing more until I found myself stretched on a blanket, and my faithful Achates — noble fellow that he was — bathing my face, chafing my temples, and wondering if I should ever revive.

Then I learned that I had swooned, and been dragged out of the tunnel by the feet — more dead than alive. The fever of delirium had seized me, and this I had mistaken for inexhaustible strength. Unquestionably I had been very near my end. If I had been allowed to remain there five minutes longer, I should have been thrown into the trench near the prison where so many poor fellows had gone before me, and have furnished the theme for a brief obituary.

Give me liberty or give me death! has become a stereotyped phrase. It is impossible to tell which is the better of the two; but I came much nearer gaining one than the other in the tunnel, which I had before associated only with the former.

When next I am thrown into prison — I do not believe it will be in my own country — I trust I shall have the means for constructing tunnels after an approved manner, and that they will not continue to balk my desires, and cheat my expectations. Tunnels, I must confess, have treated me shamefully. Again and again I have built high thoughts upon them; again and again I have placed implicit faith in them; again and again I have crowned their issue with the glorious symbol of freedom; and yet while they kept the word of promise to my ear, they broke it to my hope. Among perfidies they have been most perfidious, among treacheries the

most treacherous, among disappointments the most disappointing, among deceits the most deceitful. For nearly two wretched, painful, terrible years, I thought of tunnels kindly, advocated them warmly, loved them tenderly, labored for them, in them, through them; and still in the hour of my direst need, and in the mightiest peril of my being, they refused me comfort, gave me despair for bread. I never shall forget — I never can forget — that when freedom dawned at last, it was through the darkened sky overhead, and not through the opened end of a channel under ground.

## XXXII.

### THE MAMMOTH CAVE.

ROMANCE AND MYSTERY OF CAVES. — THE FAMOUS CAVES OF THE WORLD. — THE GREATEST CAVERN ON THE GLOBE. — ITS IMMENSE FAME. — AMERICANS' NEGLECT OF IT. — CAUSE OF THEIR INDIFFERENCE. — SITUATION OF THE MAMMOTH CAVE. — ITS MISERABLE MANAGEMENT. — ANNOYANCES AND IMPOSITIONS PRACTISED UPON TOURISTS. — JOURNEY THROUGH THE VAST TUNNEL. — WHAT ONE SEES, FEELS, AND DOES. — CONSUMPTIVE GHOSTS. — WONDERS OF THE STAR-CHAMBER. — DESCENT INTO THE BOTTOMLESS PIT. — CROSSING THE STYX AND THE LETHE. — MARVELLOUS ECHOES. — STARTLING ACCIDENTS. — WOMEN IN AWKWARD SITUATIONS.

CAVES in all ages have been associated, not only with mystery and romance, but with sorcery and superstition of every conceivable kind. Fable and tradition have converted them into the abodes of demons and witches, and history shows that robbers and law-breakers have always made them places of refuge and shelter. Every mountainous or picturesque region I have visited has abounded in witches' caves, robbers' caves, murderers' caves, and caves generally, in which supernatural rites and horrid deeds are supposed to have been celebrated or committed. The dark, dreary, and weird quality of many caves, added to their unique and fantastic formation and uncertain windings naturally awake a feeling of awe, and appeal strongly and strangely to the imagination.

The ancient priests, in order to influence favorably the minds of the ignorant, pretended that the divinities they claimed to interpret had their residence in deep and dreary caverns, and that thence they revealed their mighty purpose to their mortal agents. The oracles of Delphos, which princes and sages were wont to consult, were interpreted, as it was assumed, by a priestess sitting at the mouth of a cave, and

claiming to predict the future of nations, and tell the destiny of kings. The old Norsemen performed their barbarous rites in caverns; the Indian Brahmins devoted caverns to religious purposes, and from natural openings in the rocks constructed gorgeous temples. These subterranean chambers were doubtless the earliest abodes of men, and even now, in certain uncivilized regions, they are so employed. Petra — the Sela and Joktheel of the Bible — continues to be visited as a curiosity, because its ruins plainly indicate that its inhabitants dwelt in spaces hewn out of the solid stone. That caverns were used for the dead as well for as the living is evinced by the Catacombs of Thebes, Rome, Naples, and Malta.

The greatest caves known — new ones are constantly being discovered — are of limestone, and of comparatively recent origin. Geology teaches that the primary formations of caves are many, though small, being produced by the action of water coursing through the strata, and that the continuation of this process for ages creates the vast and beautiful chambers, which all of us are so fond of exploring. Sweden and Norway boast of granite vaults, especially Marienstadt, of extraordinary dimensions, though some of them have been, as yet, but partially penetrated. The vicinity of Quito contains caves of modern porphyry, and the Isle of France caves of lava. Gurtshellir is a cavern of lava in Iceland, forty feet high, fifty broad, and one mile long. The caves of Agtelek in Hungary, and of Adelsberg in Carniola, — the latter noted for its transparent white pillars and brilliant stalactites, — are among the most remarkable in Europe.

Adelsberg has an unusual interest for naturalists, because a strange reptile, called the proteus, half a lizard and half an eel, has its habitat there. It has an extremely elastic constitution, and an extraordinary adaptability, as may be inferred from the fact that it subsists equally well on land or in water, imbedded in rock or buried in mud, requiring neither air nor light, food nor drink, for the sustinment of its existence. What an excellent *litterateur* the proteus would be as respects its limited necessities! If it happened to be an unappreciated genius,

like most literary men, it need not feel any concern, for it could afford to wait until the world had come round to it, and the age had grown worthy of its thought. Fame, being a bubble, and therefore air, could not injure the nondescript creature, nor could the throwing of mud, as is the custom of journalists, mar it in the least. Much as it might be in (hot) water, it would not be troubled, and as to detraction and misrepresentation, its house would be (occasionally at least) built upon a rock, and would therefore stand firm.

In Venezuela is the celebrated cave of Guacharo, among the loftiest precipices of the mountain range; the entrance being through a gloomy ravine, running above a subterranean stream, the banks of which are covered with luxurious vegetation. Guacharo, as the name implies, is the resort of immense quantities of night birds, and their harsh notes resounding through its dismal recesses gave it the reputation, with the ignorant natives, of being the abode of the devil and his imps. For generations they have had traditions of dreadful ceremonies and hideous orgies held there, and have believed that many wicked persons have been seized by the imps, carried into and tortured in those awful recesses. They would not enter the cavern for any earthly consideration, sincerely believing that to do so would insure the loss of their souls. Humboldt, so far as known, was the first man who ever set foot within Guacharo; and he then succeeded, after unwearied patience and perseverance, in inducing a certain number of natives to accompany him as guides. They had not proceeded far, however, when the clamor of the birds so terrified them that they fled, in spite of every effort of the great naturalist to calm their superstitious fears.

Near Iletski, in Russia, is a freezing cave, so called because, reversing the order of the seasons, it is partially filled with ice in the summer, and altogether free from ice in the winter. Not a few of the caverns of the old world have been found to contain the bones of extinct species of animals. One of these, at Kirkdale, in Yorkshire, was discovered about half a century ago, and in it were quantities of remains of bears, lions, tigers,

hyenas, and hippopotami; all of orders that had passed away. It is presumed that the Kirkdale cave was for a long while a vast den of hyenas, and that some great inundation destroyed them and their kind.

The greatest cave known on the globe is the Mammoth Cave of Kentucky, situated in Edmonson County, near the Green River, ninety-four miles from Louisville, and nine miles from Cave City, the station on the Louisville and Nashville Railway where passengers get off when they wish to visit the celebrated cavern. The Mammoth Cave is world-renowned. I have found that the people of every nation, even our antipodes, are acquainted with it, though that may be the only thing in America of which they have any clear apprehension. I question if there be any other natural curiosity half so well known as that. Never have I travelled in any domain inhabited by intelligent people, who had not only heard of it, but who did not have something like accurate information respecting its extent and peculiarities. Famous as it is, and easy of access, comparatively few of our countrymen have explored it. Indeed, the very ease of its access has prevented a great many persons from going there who would otherwise have gone. What we can do at any time we are not likely to do at all; for any time is really no time. I have met residents of Naples who had never ascended Vesuvius, or seen the ruins of Pompeii. I am acquainted with citizens of Schaffhausen who have never set eyes on the magnificent Rhine Falls. There are Parisians who have never been in the Louvre Gallery, or the Park of Versailles; Romans who have never stood before the Apollo, the Laocoön, or the Transfiguration; Athenians who have never been within the Parthenon; Cairines to whom the pyramids are a dream; denizens of St. Petersburg unacquainted with Moscow; Viennese ignorant of the Belvedere and Schönbrunn; Berlinese unfamiliar with Potsdam, and cultivated Londoners who have never made a pilgrimage to Stratford, to the tomb of the most wonderful genius the world has yet shown.

It is not strange, therefore, that Kentuckians, liberal as

their state vanity is, should often die without "doing" the Mammoth Cave. I remember how often I went within a few miles of the cave before I took the trouble to visit it, and that, finally, dissatisfied with myself for its long neglect, I made a special journey from New York to carry out my much deferred purpose. For several years a branch railway has been talked of from Cave City to the Cave; but it has never been built, needful as it is in the saving of time. Eighteen miles of coaching, in these rapid and driving days, appear to the average traveller considerable of a task; and when to this is added the two full days required for an exploration of the enormous cavern, it is easy to understand why so many persons refuse to examine the subterranean chamber lying along the Green River.

You cannot do the cave in much less than four days, owing to the determination of the coach-driver and the keeper of the hotel to delay tourists as much as possible. I still recall my first experience, and the second and third have not been in any essential respect dissimilar. The train reached Cave City at twelve o'clock, but the vehicle that was to convey me to the vast cavern would not leave for more than two hours, this arrangement being entered into by interested parties to secure each passenger for dinner at the railway station inn.

The conveyance takes its departure very leisurely, and before you are fairly inside or outside, as the case may be, you are obliged to pay not only your fare to the cave, but your fare back, even if you have no intention of returning for a month. This ruffles most people, and impregnates them with the notion that the astuteness of negotiations in that neighborhood is not far removed from swindling—a notion apt to be strengthened as they go on. Arriving at the Mammoth Cave Hotel, a great, rambling, ill-kept, uncomfortable collection of frame buildings, of the kind of which travellers in the South cannot be ignorant, you are informed that you are too late to enter the cave on that day.

There are two routes—the long, and short; the former extending nine miles from the mouth of the cavern, and the

latter three miles. The day following you can do either of these, but if you want to do both you must remain two days. There is no need of this, since a strong man, accustomed to exercise, can make the double subterranean journey in ten or twelve hours without difficulty. Were he to do so, however, the rustic Boniface would lose the price of one day's board; and hence the tourist must be put to serious inconvenience and delay for merely mercenary reasons. Men frequently offer to pay twice or thrice the rate of the day's board for the privilege of making the entire underground journey in a single day. This is refused, because it would fully expose the trick, and give an opportunity for victims to advertise the fraud.

You may grumble—that is the privilege of every free-born citizen—but you can't help yourself. The public house employs the guides, and the guides will do nothing contrary to the annoying and cheating customs it has established. The hotel, the coachmen, and the guides, are in league one with the other, and as there is only one Mammoth Cave, and only one way of getting into it, if you are really determined to see it, you may growl and swear as much as you please, but you must conform to the rules that have been laid down for the private benefit of the little ring, and for your own disadvantage.

The cave was accidentally discovered some seventy years ago by a hunter, and ten years later was worked for the purpose of procuring saltpetre; the company so engaged finding it unprofitable, and at last abandoning it to curiosity-seekers. The property belonged originally to a Dr. Croghan, who died some years since, leaving it to the heirs of the [General] Jessup estate. These heirs are so anxious to make money out of it, and so narrow at the same time, that they have adopted a penny-wise and pound-foolish policy. They will not lease the hotel for a period of more than five years, and, consequently, no lessee can be had who will make such improvements in the house and grounds as are needed. They are very fearful that a new entrance to the cave, beyond the

limits of their real estate, will be discovered; and for this reason all visitors are forbidden to carry compasses, or make topographical observations upon the bearings or directions of the great natural tunnel. They have purchased, since 1860, some three thousand acres in the immediate vicinity of the cavern, from their apprehension that on the land which they so acquire another gateway might be found. They realize, I have been told, from fifteen thousand dollars to twenty thousand dollars per annum from the fees (two dollars each for the short, and three dollars each for the long route) charged inflexibly to every tourist. They might make more than twice as much by putting up a good hotel, building a railway to Cave City, and dealing fairly with travellers. Numerous capitalists have tried in vain to buy the cave property; but its owners, or the executors, will not sell. They refuse themselves to do anything for the benefit of the public, even when their interest prompts, and they refuse to allow anybody else the desirable privilege. This cannot very long continue, however. Time removes hunkses as well as difficulties, and cures meanness by putting it under ground.

The region about the cave is very high, — four hundred feet above Cave City, — and is said to be superlatively salubrious. The neighborhood is very sparsely settled, but dwellers in it, according to popular report, are compelled to move away when they wish to die; and hence it happens that wealthy old uncles and disagreeable mothers-in-law are always informed that Edmonson County is one of the most unhealthy localities on this continent.

Game, such as quail, rabbits, wild turkey, and even deer, is abundant there, which, with the good fishing in the Green River, less than a mile distant from the public house, should recommend the vicinity to sportsmen, and would unquestionably, if the accommodations were what they ought to be. As it is, most visitors get so vexed with the obnoxious arrangements appertaining to the Cave that they hurry off after exploring it, and seldom go back. Even their memories of its grandeur are infected with the Little Peddlington spirit

of its management, and the poetry of the place overlaid with the prose of its accompanying sordidness.

Nearly all the old guides familiar to visitors before the War, when Bell's Tavern was the starting-point for the underground journey, have yielded to nature and to circumstance. One of the ancient band, however, Sam Meredith, still lingers, — at least, he did a year or two ago — and is a genuine autochthon. He has been a guide for a quarter of a century; was born on the spot, and has never been twenty miles beyond the limits of the county. He is naturally intelligent, though he can neither read nor write; but he makes up for these slight defects of education by his skill with the rifle. He is regarded as one of the best shots in Kentucky; has a wife and children, and a small farm; receives fifteen dollars a month; does not know that the world is round; believes Paris, in Kentucky, is the capital of civilization, and is, on the whole, as contented a mortal as I have ever met.

In addition to the short and long routes already mentioned, the great cavern has a vast number of avenues and branches, many of which remain as yet unexplored. All these ramifications, taken together, would give a length to the cave, it is said, of nearly three hundred miles. Its temperature, all the year round, is 59° Fahrenheit. The interior air is believed to be much purer than that of the outer world, and, on account of its elasticity and sweetness, to be remarkably invigorating. There seems some foundation for this opinion, inasmuch as tourists can make much more exertion, and endure much more fatigue, in that underground region than they can on the ordinary surface of the earth. I have observed weak men and delicate women perform acts of pedestrianism which astonished themselves, and of which they would be incapable outside the mouth of the cavern. I know that I have done thirty miles in those sombre recesses in a few hours without being jaded in the least, and on one occasion I accomplished the last mile of the long route — the roughest and most difficult of all — in eleven minutes by a stop watch, which the guide pronounced the best cave time on record.

My last visit to the cave was during the spring of 1870. Early as the season was, I found at the hotel about a dozen persons bent on the same errand. Seven or eight of them were anxious to traverse the long route, and as that was my purpose also, we rose betimes, and prepared ourselves for the journey. There were several ladies in the party, and they were obliged to part with their hooped skirts and city attire, and put on water-proof cloaks, with the simplest possible arrangement of their hair and toilet. We tyrants of the race donned some old clothes, heavy boots, and caps, each taking a lamp attached to long wires, so that we could hold it easily and swing it as we walked along. Our conductor, who was no other than Sam Meredith, looked very carefully after our lamps, to see if they were properly supplied with oil and properly trimmed, since the consequences of having one's light go out in those desolate chambers, and of being left in awful solitude and darkness, — perhaps forever, — are in no manner pleasant to contemplate. At different parts of the cave, small tanks of oil are kept, from which the lamps may be replenished in case of accident, and these have proved to be invaluable in numerous instances.

Eight o'clock in the morning was our hour for starting, and though we had become acquainted the evening previous, we were so changed in appearance — thanks to our simple attire — that we were scarcely able to recognize one another when we assembled for the march.

The masculine excursionists had not undergone such a metamorphosis as our feminine friends, whose mothers would have been excusable for not knowing them in the Spartan severity of their costumes. One young lady, whom I had thought quite pretty, was anything but pretty in the absence of her usual chevelure and modish robes. Another girl, still in her teens, who had appeared decidedly plain, really shone with comeliness and grace in her water-proof and generally dishevelled state. Her common raiment so set her off that I was obliged to conclude that none of her personal charms depended on her wardrobe, and that the less she wore the lovelier she seemed.

A bright and intellectual widow, to whom years had brought a breadth of figure in which Hogarth's line of beauty could not be traced, looked positively grotesque in her unique garments. Agility acknowledged no kinship with her, and symmetry was unquestionably of alien blood. She expressed, from the beginning, her scepticism as to her endurance, and particularly inquired of our rustic fogleman if she could rest a little on the way, provided she should happen to be spent. As we set out, she evinced a lack of physical elasticity and clearness of movement that foreboded ill to her success. But for the gallantry due to all her sex, I should say she waddled, and presented such a figure that, if Cruikshank had caught a glimpse of her, he would have claimed her for his own.

We were off at last, and in a few minutes were before the mouth of the mighty Kentucky marvel. There is nothing remarkable in the mouth, which conveys the impression of a decayed and abandoned culvert, and such I should take it to be, had I not known otherwise. The path by which you enter is damp and slippery, unless in very dry weather, and the opening of the cavern promises none of the wonders that the interior reveals.

After going less than a hundred yards, we lost the spot of daylight which the mouth furnished, and were wrapped in such shadows as might have marked primeval chaos. Our little lamps displaced so small a part of the thick darkness that the vast volumes which remained grew blacker than ever. The air was so full of oxygen as to be sensible at once, and I could not help but notice an inflation of my lungs and a lightness of my limbs, such as one feels on mountain-tops. My spirits rose rapidly, and my mood grew involuntarily hilarious. I jested constantly, I laughed at the smallest trifle. Buoyancy was in every breath, and a mercurial quality, by a strange paradox, in the surrounding gloom. The cave, if not delightful, was exhilarating in the highest degree, and I fancied it would be agreeable to spend nights there. I should say days, if the word did not convey an impression of light. The effect of the place on me was entirely different from that

of the Paris Catacombs, owing, doubtless, to the oxygenated air. The peculiarity of my temperament, however, which, by a principle of antagonism, reflects the opposite of surroundings, must have had something to do with it. Society which is considered the gayest oppresses, and graveyards enliven me. It is not strange, therefore, that the Mammoth Cave, apart from its atmosphere, should animate my spirits.

We noticed that the walls and roof of the cavern were frescoed with bats hanging by their claws, heads downward, though some of them were flying nimbly about in the darkness, evidently disturbed by the glare of our torches, and the noise of our speech. During the winter they assemble there in such quantities that the curves of the cave are black with them. Their flitting through the thick gloom, relieved only by the flare and glare of the lamps (added to the hollow and dreary echoes awakened by our voices, and succeeded every few moments by an oppressive stillness), made those vast limestone chambers appear so dismal that the women of the party declared they should go mad if forced to remain in them for any length of time.

Very soon we came to the remnants of a number of rude habitations erected in 1845, and inhabited by certain consumptives who had been recommended to try the equable temperature and pure air of the tunnel, with the hope that their lungs might be healed. The poor patients had high expectations from living there, and though their first experience was not favorable, they remained several months, unwilling to believe that they would not be ultimately helped. The longer they remained, the worse they grew. After a while their faces became livid; the pupils of their eyes expanded, and darkened until the iris was invisible, having the appearance of two spots burning above a deathly pallor. They lost every particle of flesh; crept gloomily about, coughing so hollowly as to suggest the sound of the first earth falling upon a coffin-lid; and added to the natural dreariness of the vault a hundred-fold. Everybody saw and knew that they were tottering on the brink of the grave; and yet, such was their hope — a distinct

and inseparable accompaniment of the disease — that they could not be persuaded to quit that purgatory. They even imagined they were improving, and insisted that they were stronger, when they could not drag their leaden limbs after them.

The preciousness of existence (to most persons) was strikingly illustrated in those poor consumptives who had no hold on life, and still could not be resigned to death. One would think that serious trouble with the lungs would disarm the grave of most of the terrors it is popularly supposed to have (those who have had much familiarity with death are aware that this is an error), since it destroys all physical comfort, and all mental peace. And yet quite the contrary is true. Generally, no man is so unwilling to order the undertaker as the man who has long suffered from consumption, which shows how inconsistent and unreasonable human nature is, especially after it has been badgered by doctors and dosed with drugs.

Finally three or four of the consumptives expired in the cavern, — there were nearly twenty of them in all, — and the remainder having it borne in upon them that neither consumption nor the Mammoth Cave could insure immortality, they consented to be removed. Every one of them died — if they could be considered to have been in any true sense alive — within a few weeks after their return to the sky and the sunlight. But the history of their residence in those dreary chambers will be remembered for generations, and in 4873 will have become one of the traditions of the cave, so altered and exaggerated that very few of the positive facts will be left or allowed to mar the poetic and romantic version then current.

The cavern varies greatly in width and height, and so many avenues branch off from it, that it would be almost impossible to thread your way without a guide. A large part of the passages have been explored at different times; but some of them are virgin yet. The majority of the branches end on the bank of the river, and it is very strange that new mouths to the tunnel have not been discovered. It is not improbable

that they have been ; but the owners of the property, as I have said, are so fearful of suffering from a rivalry in the show business that they would be the last to disclose any such fact. Different quarters of the cavern are differently named, according to their actual or fancied resemblance to the titles they bear. It requires a deal of imagination to trace the similitude sometimes, though at others it is apparent at the first glance.

The Methodist Church, one of the first localities of note, is a semicircular chamber, in which a ledge of a rock represents the pulpit. Theological service has been performed there, and the logs brought in for seats are still in perfect preservation, though they have been there more than half a century. More recently service has been improvised by enthusiastic itinerants of the Methodist creed, who, having heard that the groves were God's first temples, may infer that caves have an equal fitness for divine worship. The imagination on which religious fervor so largely depends could not fail to be kindled by burning tapers, swelling music, and earnest appeals in those natural aisles and chancels, nor could they do other than remind the pious participants of the primeval Christians who fled to caverns and to catacombs that they might adore their Creator in secret, and be preserved from persecution.

Just beyond the church is a figure of gypsum on the roof, a sort of bas-relief called the American Eagle. Patriotism prevents me from indorsing this symbolic bird, which, whatever it may have been originally, is now sorely shorn and shattered. One leg, a wing, and part of the body are literally relieved, being no longer visible under the light of a dozen lamps ; and the entire animal is so deranged that it might as well be styled a dromedary or a griffin. The American eagle is usually on such admirable terms with itself that I am confident this bird would be ashamed to pretend that it is what it is represented to be. If it be an eagle, I will be sworn it does not know it. I choose to consider it a unicorn, since a unicorn is a fabulous beast, and may be presumed to resemble anything, even that amorphous gypsum figure on the roof. If the like-

ness cannot be traced by ordinary observers, they may be reminded that it consists in the—or more properly in a—horn.

Minerva's Dome is remarkable for its fluted walls and a honeycombed roof, though why it should be devoted to Minerva, who is not herself present in any form of natural sculpture, is an enigma not to be solved. The probability is, that Kentucky orators have so constantly referred to Minerva springing full-armed from the brain of Jove, that the goddess, even if she once had her image there, has removed it, lest its sight might induce the five or six public speakers in the state who have not used the time-honored simile to force it into their next brilliant effort.

Near the Dome, those who wish to traverse the short route only, branch off, while the long route is continued until the cave contracts, and Fat Man's Misery is reached. This is a passage through the rocks so very narrow that a man of average proportions is compelled to go sidewise. It must have been worn by a stream of water in the dim ages past; and now the only stream of water visible is that which flows down the sight-seer's face, as he toils along, and crawls through the Valley of Humility, where the roof is so low that you are obliged to bend nearly double. Persons with weak backs, or inclined to lumbago, have to return here with the fleshy people who have surrendered at the Fat Man's Misery. The Great Relief is a broad passage, a little farther on, where tourists bring themselves to an erect position once more, and mop their brows with their handkerchiefs, so frequently brought into activity during their arduous journey.

There are numerous streams in the cave, the chief of which have been christened the Echo and Roaring Rivers, the Styx and the Lethe; the last often called Oblivion, because the unclassical public is resolved to pronounce the Greek title as if it were a monosyllable. The Echo River is renowned for its echoes. It is much larger and more striking than the other streams, and when it is high, as it usually is in the spring, it is difficult to cross. When I last made the passage, I had to lie almost flat in the little boat to get under

the shelving rocks, and, only a few days before, the guides had to stop there in consequence of the swollen stream. After we had rowed out a little way, we shouted, and called, and sang, and had the pleasure of hearing our words come back to us again and again, with almost perfect articulation. Even the tone of the voice and the emphases are preserved, and I could scarcely believe sometimes that persons were not concealed, and repeating our phrases. The thick darkness, and the weird aspect of the cavern at that point, aid the fancy, and stimulate the feeling of superstition, said to exist, more or less, in every human breast. Two hundred years ago, countless witnesses might have been found to tell of hobgoblins and demons they had heard with their own ears, and seen with their own eyes, too, in the ghastly vault.

The Roaring River does not roar much, — indeed, not at all, — and is not especially noteworthy. It is a dark and turbid stream when it is high, though at its lower stage, it is as clear as any of the south-western waters. We rowed over it, as we had rowed over the Echo River, our little scow being as inconvenient, awkward, and dirty as its fellow.

The Styx flows about a hundred feet below the floor of the cave, and is passed by a rough wooden bridge. We could hear the murmur of the stream below, and tried, with the aid of our lumps, to see it. We did not succeed until the guide attached two or three of the lights to a long pole, and let them down over the bridge. Then we saw a great fissure in the rock (manifestly made by the water), the walls of which are tolerably smooth. The borders of the chasm were so slippery that great caution was necessary to prevent one from falling into the yawning gulf. Near the Styx is the Bottomless Pit — a nominal no less than an actual hyperbole, because it has a bottom not more than one hundred and seventy-five feet from the spot where we stood. We peered down into it as best we could, and concluded that it merited its title in point of gloom and dreariness.

Until within a few years the pit had never been descended; but several enterprising and rapid Kentuckians, who had done

nothing to distinguish themselves, thought they would render their names historic by becoming acquainted temporarily with the region which, they feared, they might know permanently in the future. They went to the spot well prepared with lights, ropes, hooks, and ladders; but the place looked so ugly that only one of them had the nerve to go down. He came within an ace of breaking his neck several times before he was lowered to the base, where, after groping about for half an hour, and finding nothing but rough rocks, he expressed a desire to be pulled up again.

This was easier said than done, in consequence of the difficulty of managing the rope. On his upward passage he was jammed against the walls, and cut by sharp ledges, until he was exhausted, more from terror and pain than from loss of blood; and finally he was dragged to the top, just as the rope, in several places, held only by a few slight strands. He did not recover from his wounds and the shock to his nervous system for a long while, and he frequently asserted that he would not repeat the excursion for any consideration under heaven. He never recovered, I may say, from the indirect effect of his exploit; for it gave him a certain local notoriety, and he nourished his fame on such generous quantities of Bourbon whiskey, known in the state as Kentucky wine, that, after several brilliant seasons of imbibition at Frankfort, the delirium tremens and two undertakers took him to his eternal home.

Since then, the descent of the Bottomless Pit has been made not unfrequently, one of George D. Prentice's sons having performed the feat, and furnished a two-column article of sophomorical extolment thereon in the Louisville Journal.

The Lethe has steep and rocky banks, and as we floated down its current, through the almost tangible darkness, with our flickering torches and the hollow murmur of our voices, it really seemed as if we might be disembodied spirits on the sad Plutonian shore. When we ceased to chatter, the dropping of water through the roof into the stream, and the dip of the oars, broke the silence with strange impressiveness.

Sam Meredith was not musical: but I remember on a pre-

vious occasion, that our ancient sable guide treated me to a dirge on the flute, while we glided over the bosom of the river of oblivion. The effect was magical; the solemn strains were so in keeping with the sombreness of the surroundings, the flame of the torches was so weird and fitful, the faces of the tourists looked so pale and wondering, and the ebony player assumed such an impishness of form and feature, that I should not have been in the least astonished to meet, sailing along in another boat, spirits long departed from the world.

Would it had been Lethe indeed! How gladly I should have drank of its waters! how willingly have forgotten the earthly life and all its sorrows, including the bad breakfast I was to get at the hotel the next morning, and the boredom I was doomed to encounter for the fortnight to come!

On the long route the most noticeable localities are the passage of El Ghor, a long, narrow, covered causeway; the Brown Chamber, so called from the color of its walls, and its square, apartment-like shape; Martha's Vineyard, the roof of which resembles clusters of grapes cut in marble; Snow-ball Grotto, showing a remarkable likeness to sculptured (floral) snow-balls overhead; the Rose Chamber, a fine counterfeit of roses in rock; Silliman's Avenue, a narrow gallery so regular that it might have been the work of engineers; and numerous chambers of different proportions, and marked by striking geological features.

The Maelstrom is an ordinary pool containing an eddy and a great disappointment at the same time. It is no more of a sham, however, than the famous (fabulous) whirlpool off the coast of Norway, which was supposed to carry down ships and whales, and which in reality is not perilous to vessels or even small open boats, except during winter and in time of violent storms.

The Rocky Mountains, the end of the long route, extend about a mile, and are nothing more than an extremely rough surface detrimental to the physical comfort and shoe-leather of those going over them. Women seldom attempt this passage, which has little to commend it except the difficulty

of its execution, and the probability of fatigue in its accomplishment.

I should have mentioned the celebrated eyeless fish, peculiar to the Echo and other rivers. They have been the cause of many scientific theories and speculations among *savants*, who have deduced from them either that Nature does not furnish organs which are of no use, or that organs unemployed cease to exist. Abundant as the fish are, it is difficult to catch them, and I was considered extremely fortunate because I secured three or four in as many minutes. I gave them to a man who had dabbled somewhat in science, and he was very grateful for the present. I told him he need not be, for I would rather have half a dozen brook trout or a Spanish mackerel for breakfast than all the eyeless fish the Mammoth Cave contained. These sightless little creatures, generally about four inches long, resemble ordinary minnows, though of a rather darker hue, and more inclined to translucency.

On the short route, the Giant's Causeway, the Gothic Chapel, the Grand Dome, and the Star Chamber, especially the last, have the most reputation and attract the most attention. The Causeway receives its name from its likeness to the Causeway on the coast of Ireland, and the likeness is considerable, as I can testify by actual observation.

The Chapel is striking and picturesque, albeit there is no more reason to call it Gothic than Doric or Ionic. It closely resembles a chapel, and I should fancy Nature might have been in an ecclesiastico-architectural mood when she formed it.

The Grand Dome is seen through a large opening in the wall, and shows to great advantage, being about one hundred feet below the ordinary level, and one hundred feet above, and possessing a vastness and majesty to which few other parts of the cave can lay claim.

The amount of rhetoric the Star Chamber has given rise to is beyond calculation. It has supplied innumerable similes, and has been discoursed upon in every language. The Chamber is some seventy feet high, and the roof is composed

of crystal of gypsum, and black oxide of manganese. As soon as we entered the Chamber, the guide took several of our lamps, descended into a hollow in the rock, and threw the light therefrom upon the ceiling. The effect was wonderful. The light, striking upon the crystals of gypsum, made them look precisely like stars, and — all the lower part of the vault being in deep shadow — created so complete an illusion that I could hardly doubt but that I was standing under the evening sky. Never was space so elongated. Those seventy feet seemed immeasurable. The longer I gazed, the more the shining ceiling appeared like the heavens. I could scarcely believe that I was under ground, and that the green grass and trees were growing above my head. I was completely lost for a while, just as any one will be after a long and earnest contemplation of the stars; and when the guide stepped out of the hollow with the lamps, and changed the scene entirely, I felt as if I had been awakened from a dream. My companions were unreserved in their expressions of astonishment and delight, and “beautiful,” “splendid,” “magnificent,” “marvellous” were the adjectives that dropped momentarily from their lips. The Mammoth Cave would be well worth visiting, if its only wonder were the Star Chamber. I have seen it a number of times, and each time its beauty is greater, and its illusion more complete.

The dimensions of the cave find their extremes in the Fat Man's Misery and the Grand Dome — the former not more than twelve inches wide, and the latter over a hundred feet. The height varies quite as much. The Valley of Humility, where one is obliged to make a crawling L of himself, is offset by the loftiest rocky chambers; and the frequently smooth limestone floor is diversified by streams, ledges, and roughnesses culminating in the so-styled Rocky Mountains. What the cave lacks more than aught else is stalactites and stalagmites, though these are found well represented in the Gothic Chapel. The great cavern is noted for its variety, having nearly all the remarkable features that characterize other celebrated caves. It is no less attractive to the ordinary

VIEWS IN MAMMOTH CAVE.

come from London, is entertaining her listeners with a droll account of the awkwardnesses and stupidities of the English. (Whenever the French wish to be particularly funny, they always caricature John Bull; and many of them really believe that no Briton can, by any possibility, appear other than uncouth and ridiculous.)

The French prints of well-dressed carousals with which we are so familiar, might be actual photographs of the *petits soupers* and their surroundings at the Café Helder. As the night wanes apace, and as the east grows gray, the revellers begin to disappear. There is something ghastly in the daylight surprise after a debauch, and the Parisians flee from it as if it brought sermons and endless prayers.

What we should call the dangerous classes would seem, from the fair outside of Paris, to have no existence there; and yet, as the police well know, many of the most cunning thieves, audacious burglars, and desperate scoundrels are native and to the manner born. They keep out of sight by day, and are rarely seen in the fashionable quarters, unless they have some special mission of villany. These fellows have their organizations and their amusements, and herd together and hold nocturnal revel in out-of-the-way dens, where no one but the gendarme or government spy would think of looking for them.

Having some desire to become acquainted externally with French scoundrels, I mentioned my desire to a private detective, who promised to take me to the district known as the Batignolles, where, he said, many of the choicest miscreants of the city were in the habit of assembling on Sunday nights. He told me that, while there was not likely to be trouble or danger, it would be well to be armed; and so, with two revolvers each, we sprang into a calèche, one stormy Sunday evening, at the Grand Hôtel, and drove to our point of destination.

After nearly an hour's ride through narrow and dreary streets, over rough pavements, and past malodorous neighborhoods, he stopped before a tall stone building, that looked like a deserted mill.

Not a light was visible anywhere, and, as the night was dark, I asked my guide if he were not mistaken in the locality. He assured me that he was not, and, taking my hand, told me he would lead the way. I could see nothing; but after we had stumbled along for a few seconds, a flash of lightning revealed a long, narrow stone staircase before us, and down this we slowly crept. At the base was a heavy oaken door, which appeared as if it might withstand a battering-ram, and I was wondering how we were to open it, when the detective put his mouth to the key-hole, and gave a peculiar whistle. The door swung open at once; we stepped into a dismal vestibule, and were confronted by a huge figure, who grunted out, "*Tout bien*," as he recognized my companion, slammed to the door, and bolted it securely. So large a Frenchman I had hardly seen. He was a giant in proportions, and I discovered by a few phrases, that he was an Alsatian. He knew what we wanted, and told us, pointing in the direction, to go to the main hall, where, to translate him freely, the boys were very lively, and having a good time.

A few steps brought us to the hall, — it should have been called a cellar, — and in it were some fifty of the most villainous-looking men and coarsest women I had ever had the misfortune to encounter. It was evident, at a glance, that they were thieves, robbers, and assassins; the slightest acquaintance with phrenology and physiognomy made that clear — that some of them were of the sneak, some of the burglar, and others of the desperado order. The place was dimly lighted with a few sputtering candles; the ceiling was low, and the air mephitic. A few of the men were standing and smoking pipes; but the greater part sat at rough tables drinking and talking in hoarse tones, with vile oaths, on subjects in which it was natural they should be interested.

A murder that had been committed a fortnight before in *Marseilles*, an account of which had been printed in the *Paris journals*, occupied much of their attention. They were very laudatory of the skilful manner in which the crime had been perpetrated, and of the adroitness displayed by the criminal in

sight-seer than it is to the naturalist, the geologist, or the general lover of science. It appeals to every taste — to that of the poet and of the philosopher, of the curious and the enthusiastic, of the reverent and the sceptical, of the worldling and the mystagogue.

How did your party come out? The masculine portion of it very much as it went in, except that some members complained very bitterly of fatigue. The feminine portion suffered in various ways. The young woman who had been changed for the worse by the cave costume, grew homelier and homelier every mile she went, and so disenchanted her immediate companion — he was her lover, I think — that after the excursion he ceased to regard her with fond and favoring eyes.

The other young woman, who needed not the foreign aid of ornament, steadily improved with fatigue, drippings of water, and splashings of mud. If she had fallen into the Styx or Lethe, and then been drawn for half an hour over the floor of the cave, I have little doubt she would have appeared charming. I never knew one of her sex to make such æsthetic advances under adverse circumstances.

The plethoric widow gave out a dozen times during the journey, detained us materially, and was at last left behind, in company with a sympathizing friend, until the rest of us had retraced our steps, and literally taken her up again. She declared that she never would be able to get rested; and two weeks after her journey I heard she was still an inmate of the hotel, bemoaning her fatigue and disordered nerves.

Persons have been lost, from time to time, in the cave, but not nearly so often as has been reported. Some years ago, one of a party who made the exploration disappeared in the Star Chamber, and all effort to find him proved abortive. When they went back to the hotel, the greater part of the valuables belonging to the excursionists, which had been deposited with the landlord, had faded out of sight. Investigation established a close connection between the disappearance of the man in the Star Chamber and the watches

and jewelry. The fellow was, unquestionably, a professional thief, but had pretended to be a clergyman from St. Louis. After the party had set out, he hurried back to the house, and informing Boniface that the ladies and gentlemen had altered their minds, and preferred to take their valuables with them, the latter was unsuspecting enough to hand them over. The pretended divine rejoined the excursionists, kept his own counsel, and consulted his interests by disappearing from the Star Chamber when the lamps had been removed.

In 1835 two men from Bourbon County, Kentucky, — their appearance indicated that they had for a long time quaffed the fiery beverage of that region, — arrived at Bell's Tavern, and declared that they could go all through the cave without a guide, and come out safely. They even laid wagers to that effect, and though they were warned against such folly, they started upon their expedition. They certainly went in, but they have never come out; and as thirty-seven years have elapsed, it is highly probable they have deferred their return indefinitely. It is supposed that they got lost in some of the windings off the main route, and starved to death.

In the summer of 1840, a middle-aged lady from Boston suddenly swooned from fatigue, while making the underground journey, and sinking to the earth in silence, the remainder of the party went on without missing her. On their way back, the guide observed her sitting on a stone, chattering to herself like a monkey. The poor woman had become insane. Recovering her consciousness, and finding herself in the darkness, — for in her fall she had extinguished her lamp, — she had believed herself lost, as it is supposed, and the terror had shattered her intellect. The excursionists had not been absent two hours; and yet that brief time was sufficient to destroy her reason utterly. She never recovered, and died two years after in the Worcester (Massachusetts) Insane Asylum, a raving maniac.

To be lost in the Mammoth Cave would be enough to overturn the strongest brain, since, with all its beauties and wonders, it has capacities for terrible tragedy and ineffable horror.

## XXXIII.

### INSURANCE AND ITS MYSTERIES.

HISTORY OF FIRE AND MARINE INSURANCE. — LIFE INSURANCE. — OBJECTIONS OF A CALIFORNIAN. — HOW HE ANSWERED AN AGENT. — FRAUDS UPON COMPANIES. — A DEEP-LAID SCHEME. — JOHNSON AND HIS THIRTY THOUSAND DOLLARS. — OPENING A GRAVE. — A FICTITIOUS CORPSE. — PURSUIT BY DETECTIVES AND CAPTURE OF THE SWINDLER. — LITIGATIONS ABOUT INSURANCE. — CHINESE TRICKS ON AGENTS. — SUBSTITUTES FOR EXECUTION.

THE system of fire and marine insurance has been in use for centuries. The Chinese claim to have invented it, as they have claimed nearly everything else; but the probabilities are, that it was of western origin. It is alluded to in the English laws about the middle of the thirteenth century. Its earliest form was in that of marine insurance; afterwards the system of fire insurance was invented. Still later came insurance against death, which has grown in recent years to very great proportions.

Many people are unable to understand how insurances can be effected against an event which is sure to happen. There is a story of a man in California who was approached by an insurance agent with a request to take out a policy on his life. The agent painted in glowing colors the advantages of insurance, and the man listened to him very patiently. When the agent had finished his story, the victim said with great deliberation, "Stranger, I have lived in this yere country twenty-five years. I have bucked agin nearly every game that they have ever brought out, but I'll be hanged if I want to play at anything where I have got to die before I can win."

The objection which this individual made against insuring

his life, was a very natural one, and is an objection made by many people, though in a different form. The insurance companies, some of them at least, meet this objection with a plan by which a man arriving at a certain age without dying, can draw the money that would come to his heirs in case he died before the specified age was attained. They have devised other plans to meet the objections of all classes of people, and it is safe to say, that the system of life insurance is about as near perfection as it is possible to bring it. It is a question whether, in many cases, the companies do not reap a much larger advantage than is their just due. It is noticeable that the companies, as a general thing, pay enormous salaries to their officers, erect costly buildings, pay heavy dividends, and have a good time generally. The conclusion is natural that the rates of insurance are altogether too high, and the advantages are much greater for the companies than for their patrons.

It is possible, sometimes, for dishonest men to defraud the insurance companies, though it is not always easy. The companies are generally on the safe side; they require the most positive proof of the death of a person whose life has been insured, and they throw a great many obstacles in the way of the collection of the amount of the insurance. I have known them to demand one certificate after another, and compel the person who was endeavoring to collect the insurance money to make ten or twelve visits to the office before meeting his just demands. Very often, after the death of an insured person, questions are raised which were never before mentioned. The premiums may have been paid for years, and the officers of the company claim to make a discovery that relieves them from all responsibility. In some cases their action in this respect is just, but in many others it is about as unjust as anything that can well be conceived. It would seem proper that where a person has been accepted for insurance, and the premiums on the amount of money called for have been regularly paid and received without objection, no objection should be raised after the person's death.

Some interesting stories are told of the way in which insurance companies are sometimes defrauded. One was told to me by the secretary of a prominent company in New York, which indicates great ingenuity on the part of the swindler.

"One day," said the secretary, "a man called at our office, and said he wished to effect an insurance of ten thousand dollars on his life, and was ready to submit himself for immediate examination.

"The physician of the company was called in, and made a careful examination of this man, whom I will call Johnson. Johnson was pronounced a good subject. All sorts of questions were asked, and he answered all of them satisfactorily. He was closely inspected. His limbs were pinched, and his chest was thumped in the orthodox way, but no defect could be discovered. To all appearances he was good for three-score and ten, and possibly more. He gave us references, stated that he was a clerk in an up-town house, and his statement was fully verified. I called upon his employer, inquired about his clerk, and was told that his character was of the best, and that he was a very industrious and strictly temperate young man. We were satisfied, and insured his life for the full amount.

"In a little while he made a request to be permitted to travel west, and of course we granted it. His parents lived in a small town in Connecticut. He had married in New York, and had been married for three or four years. Occasionally he took his wife on a brief visit to his old home. He went west soon after his application, and we lost sight of him. His wife accompanied him, and he announced his intention of finding employment and settling in one of the western cities.

"Six or eight months after his departure, his wife telegraphed to her friends in the east that her husband was very ill with pneumonia. Two days later she telegraphed that he was dead, and that she would bring the body to Connecticut for burial.

"In due course of time she arrived, dressed in deep mourn-

ing, and evidently suffering from deep grief. The funeral was held, his parents attended, the coffin was opened, and the features were visible through the glass plate, though they were much dimmed by the moisture which collected on the inside.

"A few days after the funeral, the widow, whose name had been inserted in the policy at the request of her loving husband, called at our office, presented the proper papers, and made the necessary application. We made an investigation, were satisfied that everything was correct, and paid over the money.

"We lost sight of the widow after that, but learned casually that after a short residence in New York she had gone to California.

"We happened to learn also, soon after, that the same man had insured his life for ten thousand dollars in another company, a Massachusetts one, having an agency in New York; and also in a Hartford company for the same amount. Of course this naturally raised our suspicions. The premium on thirty thousand dollars is a very heavy one for a man on a clerk's salary, and we became convinced that all was not right; so we began an investigation.

"We saw the merchant that had employed Johnson while in this city, and learned that the young man went west at the time indicated. The merchant had heard of his death, but had no positive proof or knowledge of it. Then we went to the village in Connecticut whence Johnson had hailed, and though we made the most searching inquiries, we could learn nothing to confirm our suspicions. His parents were positive of his death. Had they not seen his widow? and had they not seen his features through the glass plate of the coffin? and had they not seen that coffin buried in the public cemetery? To their minds everything was perfectly straight, and they were indignant at our supposing that there might be something wrong.

"I had a suspicion that the body in the coffin might be a 'dummy' with a wax face, in imitation of the features of

Johnson. So I hired the sexton in charge of the cemetery to open the grave and allow me to examine the interior of the coffin. We did the work at night, and unknown to Johnson's parents, as we knew they would be greatly offended if they learned what was going on. But I was doomed to disappointment, as the corpse proved to be genuine, and as good a one as ever was buried. Plainly I was on the wrong scent when searching for a body of straw and a face of wax.

"The three companies agreed to work in concert, and share the expenses of an investigation into the whole affair. We sent a detective to the city where Johnson had died, and after a little inquiry he ascertained that a man answering to the name of Johnson, and the proper description, had actually died in that city. His body had been sent to the east, and that was all that was known; but it was ascertained that instead of dying of pneumonia after a few days' illness, the man had lingered some time with a disease strongly resembling consumption. Here was a clew which we determined to follow up.

"As the widow had gone to California, we told the detective to follow, and trace her out. She had written no letters to the parents of her dead husband, except a single one announcing her arrival at San Francisco, and giving a brief description of her overland journey. She said she had friends living near San Francisco, and she expected to reside a short time with them; perhaps she might remain in that place through the winter, and perhaps not; could not tell; would write again.

"The detective had a long search for the widow, and visited every place around San Francisco, and even advertised for the missing Mrs. Johnson. His advertisement stated, after describing her in sufficiently explicit terms, that by sending a note to a certain address she would learn something to her advantage. This was not exactly true, as she would have learned something greatly to her disadvantage, had the detective been able to find her; but in the pursuit of criminals, it is generally considered proper to tell a few falsehoods in order to serve the ends of justice.

"One day the detective visited a ship which had just come in from the Sandwich Islands. He went there with an acquaintance who knew the captain, and was invited on board. While they were in the cabin enjoying the captain's welcome, the detective heard the ship's steward telling a friend, who had called to see him, something about their last voyage out. He said there were a lady and gentleman, very nice people, who occupied a state-room, which he indicated, and who seemed to be very fond of each other. 'They had a good deal of money with them,' said the steward, 'and they were pretty liberal with it, though they would never allow me or anybody else to go into their state-room, unless one of them was there. They had their money in a small trunk, which they kept under the lower berth; and whenever they were both out of the room at the same time, they always carried the key with them.

" 'When their room was fixed up in the morning, one of them always stood near the door; and if we wanted to steal ever so much, we would not have had a chance. To make everything sure, they had a spring-lock on the door—a lock they brought with them, and fixed there with the captain's permission. They were not going to have anybody get into their room with a pass-key.'

"The steward went on to describe the couple, and the detective found himself interested. So he questioned him very closely, and became pretty well satisfied that the gentleman was the veritable Johnson who was supposed to be dead and buried some months before in Connecticut, and that the lady was the disconsolate widow who had drawn the money from the insurance company.

"Here was a dilemma; the captain and steward only knew that their passengers had gone to Honolulu. They sailed not under the name of Johnson, but under the very rare name of Smith. John Smith, I believe, was the gentleman's name, while the lady was Mrs. John Smith. It is not easy, as everybody knows, to trace out a man bearing this name; and even if he could be traced, very little good could come out of it, if

the man were in one of the South Pacific Islands, or, in fact, in any place where our extradition laws could not reach him.

"While we were about it, we thought it would be well to know the whole truth of the matter; and so we sent the detective down to the islands, and told him to follow them up, but not to make it expensive. He went to the islands, and there found that the parties had gone to Australia. Then he went to Australia, and traced them to New Zealand, and in New Zealand he found that they had gone, according to the best of his information, in about three different ways; so he went back to Australia. After a long and vigilant search he found them in Melbourne.

"He had no authority for the arrest and detention of Johnson, though he made him believe that he had, and frightened him into giving up half of the money he had fraudulently obtained, on condition that he should not be further troubled, and on the condition also that he should tell the whole story of the accomplishment of his fraud. As long as we could not get the fellow, we thought his story would be an interesting one, and would serve to put us on our guard in future. The detective obtained what he believed the whole story, and with the money Johnson had returned he made his way as speedily as possible to New York.

"The deception began at the very outset of the scheme. Bear in mind that the man's name was Johnson, that he was from a town in Connecticut, had married his wife in New York, and was in the store of a merchant of the great metropolis. There was a clerk in that store by the name of Johnson, and he was from Connecticut; we will say Smithville. He had married in New York about four years before this occurrence. He was a steady, well-behaved man, and contemplated going west. His wife had a small amount of property in her own name, but she was not personally known to the merchant, and the merchant did not know that Johnson hailed from Smithville. There was another clerk in the adjoining store whose name was likewise Johnson. For convenience in designating the two men, I will call the second one Roberts.

He came from Brownsville, in Connecticut. He had been married about four years. He was a fast fellow, and rather unscrupulous, though his employer did not know that he was in any way dishonest. The two clerks had become acquainted by accident.

"When Roberts ascertained that Johnson conceived the idea of going west, he (Roberts) laid a plan for swindling somebody. His wife was as unscrupulous as himself, and so she entered into the scheme. Roberts was of vigorous health, and could pass an examination with a life insurance company without trouble. He was of the height, complexion, and general appearance of Johnson; and this fact, added to the other coincidences greatly favored his scheme. So he came to us, and obtained the insurance, as before stated. When we made the inquiry of the merchant, his answers were satisfactory, and all the references were exactly as he stated them.

"His plan worked completely. He waited patiently until Johnson went west, and then he went likewise. He did not, however, go to the same city.

"He explained that it was his intention, a month or two after his arrival out west, to obtain from a body-snatcher a corpse which would answer his description, and then his wife would send the proper telegram to her friends in the east, and proceed there with the remains, which would appear to be those of her husband.

"Fortune favored his scheme more than he had anticipated. At a boarding-house where he was temporarily lodged, he found that a boarder named Johnson was in very bad health, and not expected to live. Affecting an interest in him, and claiming to discover a relationship, he tended him carefully until the time of his death. The detective had a suspicion that the sick man was helped along, but of that there was no proof. Immediately after the death of the invalid, the telegram was sent, and the wife proceeded east, as before related. She had been at one time an actress, and was very good at simulating grief. She deceived all the relatives of her husband in the most complete manner. They thought her bowed down and broken-hearted with grief, when all the time she

was doubtless laughing in her sleeve. The honest Johnson, whose name had been used without his knowledge or consent, was found, after the detective's return, to have lived at St. Louis, the place to which he had first emigrated, and had gone thence to New Orleans. He was much surprised when he learned what had occurred, and positively denied ever having an insurance on his life, or on that of anybody else. I suppose the swindler Johnson is still in Australia, and trust that he will end his days there in peace and quiet — though I fear his success in this instance will embolden him to some other fraud. His operation was fairly, though not exceedingly profitable, as, after deducting the premiums for the first year of insurance, the expenses of his expedition, and the money he returned, he did not net more than ten thousand dollars by the operation."

Some of the insurance companies insert in their policies an announcement that the policy becomes void if death results from execution on the gallows, or in any other legal way, or from suicide. On one occasion a man whose life was insured was killed in a duel, and the company refused to pay the policy, on the ground that the man died virtually by his own act. His adversary was known to be a dead shot. The lawyer of the company, after stating all the arguments to show that a man who goes a duelling is, for all practical purposes, a suicide, clinched his argument by declaring that a man who would go out with such an adversary might know beforehand that he would be killed, and therefore his death was voluntary. I believe the court did not sustain the claim of the company, but required the amount named in the policy to be paid to the heirs of the unfortunate duellist.

I have heard it argued by insurance men that, where a person insured takes to hard drinking, and dies from the effects of rum, he dies by his own hand, and the suicide clause exempts the insurance company. In some cases, I believe, this claim has been sustained; but it is now generally discarded. A few cases have occurred in the United States where men have insured their lives for the benefit of their

families, and have then deliberately killed themselves. The insurance companies, in those cases, have resisted the payment of the claims; but, I believe, they have been generally, though not always, allowed.

There are some countries in the world where an insurance company would be ruined in a very short time, if it paid the insurance claims of men who kill themselves. In China, for instance, let a company start upon this basis, and it would do a flourishing business for a short time. Men in China are much more ready than others to die for the benefit of their families or themselves; and a Chinese who could make a good thing by killing himself would be sure to do it. A company doing business in the way I have just stated would find, some pleasant morning, that about half of its policy-holders were dead, and the other half were making their preparations for blotting themselves out of existence. The Chinese loves his family, and would think he was doing a nice stroke of business by insuring his life for their benefit, and then, quietly bidding them good by, "handing in his checks." If he could effect an insurance for a thousand dollars, he would spend a hundred in having a glorious spree, and leave nine hundred dollars to his afflicted widow.

The indifference of the Chinese to death may be well illustrated by an allusion to the substitute system, as practised in the Celestial Empire. Persons condemned to death for certain offences are allowed to die by a substitute. This would be utterly impossible in America, as one could nowhere buy a substitute who would be willing to die for a stipulated sum; but in the Celestial Empire it is easy enough to find a man who is ready to take the place of one accused of a crime and ordered to be executed. The real culprit sends a friend to make the negotiations. The broker can find a man for about six hundred dollars, half down, and the balance on the fulfilment of the contract. The cash is paid, and the time fixed for the execution, both of the contract and substitute. With the money in hand, the substitute assembles his friends, and they have a right royal spree. Everybody gets blind drunk

EXECUTION OF A CHINESE CRIMINAL.

on sam-shoo or opium, and when the money is all expended, the substitute bids farewell to his friends, and delivers himself up for sacrifice. He is led to the place of execution, where he drops on his knees. His head is bent forward, the executioner's sword whizzes through the air, and the substitute is a head shorter by the operation. The culprit, who has thus satisfied the law by proxy, pays over the balance of the money to the widow of the departed; everything is lovely, and everybody is happy.

## XXXIV.

### RAILWAY TUNNELS.

TUNNELS AMONG THE ANCIENTS. — HOW THEY WERE MADE. — MODERN TUNNELS AND THEIR LENGTH. — LAUGHABLE INCIDENTS IN RAILWAY TUNNELS. — THE TWO LOVERS. — THE ANXIOUS FRENCHMAN. — ROBBERS. — THE HOOSAC TUNNEL. — ITS HISTORY. — THE AUTHOR'S VISIT. — NATURE AND PROGRESS OF THE WORK. — AN EXPLOSION. — ACCIDENT FROM NITRO-GLYCERINE. — THE CENTRAL SHAFT. — THE TERRIBLE CALAMITY OF 1867.

QUITE recently I picked up a newspaper about thirty years old, and read in it an account of the great engineering difficulties which had been overcome in the construction of the Boston and Lowell Railway.

This road, twenty-five miles in length, was among the earliest constructed in America, there being less than half a dozen railway lines which are older. The account proceeded to say that the great obstacle was the deep cut through solid rock, near the city of Lowell; and I can remember, in my boyhood days, riding over this road, and as we reached the cut, the attention of passengers was called to it, and at least half our number projected their heads through the windows to look at the wonderful work. Three times was the work let out on contract, and twice did the contractors fail, one of them failing not only to complete the work, but to pay the men he employed. The third contractor succeeded, but I believe he made no money out of his speculation.

This once famous cut through solid rock is only a few hundred feet in length, and I think about forty feet in depth. It has dwarfed into almost microscopic insignificance by hundreds of other railway cuts in this country and in Europe.

Railway tunnels were at that day unknown, though tunnels existed in Europe for other purposes, some of them of very ancient date.

Tunnelling, in civil engineering, is an underground passage usually constructed for conducting a canal or road beneath elevated ground. In mining the term is also sometimes applied to horizontal excavations. Tunnels are more common in Europe upon railways and canals than in this country. In the United States the total length of tunnels is not more than one mile for every thousand miles of road. In Great Britain it is considered cheaper to tunnel through rocks than to make open cuts deeper than sixty feet. In England the Wood-head Tunnel exceeds three miles in length; and there is another on the London and North-western Railway nearly three miles long. Twelve or fifteen others on different roads exceed one mile each. The Box Tunnel on the Great Western Railway, between Bath and Chippenham, is thirty-one hundred and twenty-three yards long, or rather more than one and three fourth miles.

On the canals of England there are five tunnels exceeding three thousand yards in length. The longest of these is the Marsden Tunnel, fifty-five hundred yards long. In France there is one tunnel on the St. Quentin Canal over thirteen thousand yards long.

Some of the tunnels of the ancient Romans were quite extensive in their character. One which was constructed by the Emperor Claudius was cleared out some years since by the Italian government. It proved to be about three miles long, thirty feet high, and twenty-eight feet wide at the entrance, and was nowhere less than twenty feet high.

The excavation seems to have been conducted, after the plan practised at the present time, by means of a number of vertical shafts first sunk on the line of the tunnel, and from the bottom of these shafts the work was carried on simultaneously in opposite directions.

Another tunnel, made in the early period of the Roman republic for the partial drainage of the Alban Lake, is more than one mile long.

Most of the tunnels in America are on the lines crossing the Alleghany Mountains. There is one tunnel on the Penn-

sylvania Railway thirty-six hundred feet long. It was built in two years, and cost half a million dollars. There are many short tunnels on the line of the Baltimore and Ohio Railway, and there is a tunnel on the Blue Ridge Railway in Virginia forty-two hundred feet long. In South Carolina there are several tunnels, one of them nearly six thousand feet long. The Long Dock Tunnel in Bergen, New Jersey, opposite New York city, was completed in 1860. It is forty-three hundred feet long, twenty-three feet high, and thirty feet wide. On the line of the Central Pacific Railway, over the Sierra Nevada Mountains, there are several tunnels, the longest of them exceeding a mile; and railway engineering was carried to such perfection in the construction of this road that its tunnels were completed in a shorter time than in works of the same kind and with an equal hardness of rock anywhere else in the United States.

A journey through a railway tunnel is always more or less interesting to a novice, but an old traveller soon gets accustomed to it, and pays very little attention. On most roads, when a long tunnel is approached, it is customary in the daytime to light the lamps but this is by no means the general rule. Some queer incidents occur in these dark-journeys through tunnels.

The darkness is so thick that one could almost cut it with a knife. It affords opportunities for enterprise, either for entertainment or mischief. Enterprising robbers sometimes conduct their operations in railway tunnels. Half a dozen of them will jostle a passenger, pick his pocket, and carry away his satchel, and when he emerges from the tunnel the robbers will have disappeared. It not unfrequently happens that loving couples bestow attentions upon each other in passing through tunnels which they would hardly indulge in were they in open daylight, and under the eyes of their fellow-passengers.

Every one has read, and many have seen, demure couples sitting quietly in their seats as the train enters a tunnel. There would be heard the sounds of a slight struggle, and

also of less slight kisses. When the train emerges into the daylight, the pair will be sitting as demure as ever, but with reddened cheeks and a general appearance of disorder.

On one occasion I was riding on a train approaching the Bergen Tunnel, near New York. The lamps were not trimmed and burning, and when in the tunnel we were as much in the dark as an ignorant newsboy attempting to read a page of Sanscrit.

In front of me was a young couple, and by their devoted attention to each other I concluded that they were not married, or, if married, were wedded to somebody else than to themselves. The gentleman was reading a newspaper; the lady was busy with a novel, and giving an occasional glance out of the window. As soon as the train entered the tunnel it was so dark that you could not see anything. I heard a struggle. There seemed to be a dislocation of hair, accompanied by a shower of hair pins. The gentleman's hat fell to the floor, and I heard his paper crush as though it had been taken up by a clothes-wringer. Then there were several warm osculations, accompanied by ejaculations which sounded like, "You ought to be ashamed. Somebody will hear you."

These utterances seemed to be more a matter of form than anything else, as the kissing went on like a company of infantry engaged in file-firing. You would have imagined that a whole flock of school-girls had met another flock of school-girls, from whom they had been separated at least six months.

By and by the train came out of the tunnel.

The gentleman recovered his hat and pretended to be reading his newspaper; he had it upside down, and it was torn half through. The lady's book was open at about the first page, though she had been reading it for three hours. Her hair had been loosened, and was falling down. Her lace collar was disordered, and quite in keeping with the collar of her masculine friend, one side of which was turned up like the toe of an old boot, while his neck-tie had lost its trim knot, and its ends were dangling like a pair of fish lines over the side of a ship. The gentleman and lady were very red in the

face, and somewhat exhausted, and altogether they looked like a pair of butterflies that had been run through a sausage machine.

A story is told of a Frenchman travelling in a railway coach in England, who was very anxious to change his shirt in order to make a visit after the train had arrived, without taking the trouble to go to a hotel. His guide-book indicated a tunnel on the road, and he asked the guard or conductor how long the train would be in the tunnel. The guard mistook his question, and supposed he asked how long before the train would reach the tunnel. He answered briefly, "Half an hour."

The coach in which the Frenchman was travelling was filled with ladies and gentlemen. The traveller got down his valise, unlocked it, and made everything ready for a change of apparel while they were in the tunnel. As soon as they entered it he pulled off his shirt, and prepared to put on a clean one; but imagine his surprise, and that of his companions, on discovering that the train remained only three minutes in the tunnel, instead of thirty. As they came out in open daylight he was standing in their midst in a condition quite unfit for a mixed company of ladies and gentlemen.

The longest railway tunnel in the United States, when it is completed, will be the Hoosac Tunnel, in Massachusetts. Its total length is twenty-four thousand five hundred feet, or more than four and one half miles. Its width is eighteen feet, and its depth fourteen feet. As long ago as 1825, the Hoosac Tunnel route was surveyed, and a legislative commission was appointed to investigate the practicability of building a canal from Boston to the Hudson River. They made their report, in which they recommended a tunnel through the mountain.

In 1828 another commission reported to the legislature of Massachusetts that they could get over the mountain with a railway more quickly and more cheaply than through it, and recommended the Boston and Albany line, which was opened for travel in 1842.

From Boston to the Hudson River the route by way of the

Hoosac Mountain is very feasible, with the exception of the mountain itself.

A story is told that Loammi Baldwin, the engineer who made the first survey for the canal, was very much in favor of this route. With a map or plan spread before him, he would say to the listener, "Why, sir, it seems as if the finger of Providence had marked out this route from the east to the west." "Perhaps so," said a listener, one day; "but what a pity it is that the finger of Providence had not been thrust through the Hoosac Mountain!"

In 1848 a company was chartered to construct a railway between Troy and Greenfield. Three years later the work was begun, and the directors voted to expend twenty-five thousand dollars in making experiments upon the proposed tunnel. An enormous machine was constructed and set to work in the winter of 1852. It was expected to perform wonders, and it did; but they were all the wrong way. The chief wonder was, that the machine, so carefully constructed, at such great cost, could do nothing whatever.

According to the description, it was "designed to cut a groove around the circumference of the tunnel thirteen inches wide and twenty-four in diameter, by means of a set of revolving cutters. When this groove had been cut the proper depth, the machine was to be run back on its railway, and the centre core blasted out by gunpowder, and split off by means of wedges." This wonderful engine was not all that fancy painted it. It cut a very smooth and beautiful hole into the rock for about ten feet. Then it became deranged, and then — it never smiled again. Its cutting days were over, and when it was withdrawn it was quickly discarded and sold for old iron.

Another boring machine of the same sort, which was to cut a hole only eight feet in diameter, was tried at the other end. That, too, made a most glorious failure. Its failure was even more brilliant than that of the first machine, for it never succeeded in cutting a single inch of rock.

Different engineers have tried their hands and their skill

on the Hoosac Tunnel. In 1854, the legislature of Massachusetts appropriated two millions of dollars to the Troy and Greenfield Railway, and in the following year they were at work in earnest.

General Haupt, who became famous in the late war as a bridge-builder, attempted to pierce the Hoosac Mountain; but after several years he abandoned the work, and the whole property of the company was transferred to the State of Massachusetts. When the state took possession it began work on its own account, and in 1868 the legislature appropriated five millions of dollars, and made a contract with Walter and Francis Shanly, of Canada, for the completion of the tunnel. They began work in the following March, and there is very little doubt of their completing the tunnel.

In 1870 I made an excursion up the valley of the Connecticut as far as Greenfield, and there took the railway train to the Hoosac Mountain. At the east side or end of the tunnel I abandoned the cars, and took to a six-horse coach. I managed to obtain a seat near the driver, a burly, moon-faced fellow, who collected fifty cents extra for the privilege of riding near him. He treated everybody on the outside as politely as though he were king of the Cannibal Islands, and we were his subjects. For downright impudence, with a good deal of rudeness to the bushel, I will back an American stage-driver against any other man in the world.

Soon after dinner we drove away from the station, and after the horses had given us a little circus exhibition on their own account, which threatened to overturn us and break half a dozen necks, we climbed slowly up the valley skirting the edge of a forest, whose leaves were tinged with the varying colors of autumn. Our progress up the eastern face of the mountain was slow, but when we came down the western side the case was different. On the upper part of the mountain there is a long and comparatively level stretch of ground, on which there are many fine farms, and a general appearance of prosperity. Approaching the western face of the mountain, we overlooked the flourishing town of

North Adams, and a region of country spread out before us like a beautiful panorama. I have looked from mountains in many countries, but rarely have I gazed upon a landscape more beautiful and more attractive than this. It is not grand — awfully grand — in its character, like many other landscapes, but there is an air of beauty about it which makes it charming in the extreme.

The road winds, in a sort of zigzag, down the side of the mountain, and our horses went at a good speed. The coach swung from side to side, and the baby of a feminine passenger screamed as if a dozen pins were being driven an inch or so, into its arms and legs. Down, down, down the mountain we went, and soon we were inside the busy town, and were driven up in front of the Wilson House. There I concluded to remain, and take my point of departure the next day for the tunnel.

On the following morning it was raining, not exactly cats and dogs, but a drizzly, misty, damp — very damp — sort of rain. I did not care very much for rain, though, especially as it made no difference, when once in the tunnel, what the outside weather might be. When breakfast was over, I started for the tunnel under the escort of the proprietor of the hotel.

The western portal of the tunnel is two miles south of the village. The road leading to it is among some small hills that appear trying to hug the mountain. Mr. Haupt began his work on this side of the mountain, and a part of it still remains. He began it in a limestone rock, from which he expected to pass directly into the solid primary rock, forming the base of the mountain; but to his surprise and mortification, his hopes were not realized.

Instead of reaching the solid rock, he entered into a mass that is known as demoralized rock, a sort of combination of mica, quicksand, water, and everything else that is disagreeable. It was perfectly unmanageable. As fast as they dug it out it flowed in. Imagine a mouse attempting to construct a tunnel through a barrel of swill, and you can form a very good idea of the difficulty of working in this rock. You

might as well attempt to make a tunnel through a thousand cart-loads of soft mud; in fact, you could get along easier in the mud than in this demoralized rock, because you could take precautions against the flowing in of the mud, which you could not take against this disintegrated mica. It is a sort of soft stuff which French miners denominate "mou-tarde," and English miners allude to as "porridge."

In order to escape this porridge, the engineer tried to make a tunnel farther up the hill-side; but it was of no use. There was the stuff again, and somehow it must be met. Not only was it impossible to prevent its caving in, but it was necessary to prevent its rising upward. Consequently an arch must be made below, as well as above; in fact, it was necessary to construct the brick-work in such a way that it would form, when completed, a perfect cylinder, as the pressure of the porridge would be exerted in all directions. As the work was put forward and completed, a casing of timber was made, and inside this casing of timber the brick arch of the tunnel was built.

Our first visit was made to the western portal, into which we penetrated several hundred feet. For about seven hundred feet, the tunnel is laid in brick seven or eight courses thick, and forms a complete arch. Beyond that the rock is quite soft, but sufficiently hard to sustain itself long enough to permit the construction of an arch. When this work is completed there will be some two thousand feet of brick arching.

We thought that in entering this western part of the tunnel, we should get out of the rain; but we found streams of water occasionally coming through the brick-work, and especially through the stone at the heading, where the work of arching was going on. Quite a stream of water ran through the bottom of the tunnel, and I managed, in the course of my walk, to get my feet pretty thoroughly soaked. However, I had been wisely encased in a suit of old clothes, and when I emerged, there was more mud than clothing visible about me.

Climbing out of the western portal, we took the open road

**EASTERN ENTRANCE TO HOOSAC TUNNEL.**

**WESTERN ENTRANCE TO HOOSAC TUNNEL.**

again, and went to what is known as the western shaft. The work through the demoralized rock and porridge was so slow that the engineers determined to sink a shaft farther up the mountain. It is about half a mile from the portal, and is three hundred and eighteen feet deep.

As soon as the shaft was sunk, the miners turned and worked outwards through the soft rock, cutting a small passage through to the western portal, so as to allow the water to drain off, and thus save the use of the pumps. In the other direction, that is, towards the east, the miners had found the solid rock of the mountain. At the time of my visit they were about half a mile from the bottom of the shaft.

Along our road forming the portal to the shaft, there was a small stream of water. My guide explained to me that in the great flood a year before, the water came down, tearing away the embankment which separated the brook from the tunnel. In a few minutes the embankment was all torn away, and the whole force of the stream was poured into the tunnel. An alarm was given as quickly as possible, and by running rapidly, the men who were working in the tunnel escaped, with the exception of one who was doing his first day's work there, and was probably delayed by his unfamiliarity with the place. In a very short time the water completely filled the tunnel, and it was some weeks before the works were restored to their old condition.

Along this brook and around the west shaft there is quite a village occupied by the miners and their families. The town of North Adams has provided a school-house and a school for the children, of whom nearly one hundred receive instruction there during the week. For a part of the year the school-house is occupied at different hours, on Sunday, by two Sunday schools, one conducted by some of the Protestant churches, while the other is under the care of the Roman Catholics.

Around the shaft are the usual buildings and shops for the repair of tools, and for the ordinary machinery used about the mine. After a pleasant talk in the office of the superin-

tendent, I was requested to dress in an oil-skin suit and a lantern, preparatory to going below. When all was ready, we went to the shaft, entered a cage, and descended. From the bottom of the shaft we struck out along the tunnel to make our way to the heading.

Our guide explained to us that there would be a blast in about twenty minutes, and that we must move forward at good speed in order to see it. "Step right out without fear," said he; "there is no danger of falling through, as the bottom is perfectly solid. You need not mind splashing those boots with water and mud, as they are used to it."

I obeyed his directions and followed him, and I did some very rapid walking. The lanterns gave out just about light enough to make darkness visible. Away in the distance we could see the lights of the miners, and hear the noise made by the machinery and the tools of the workmen. An iron pipe six inches in diameter lay at one side of the floor, and through this was forced the air which furnished the power to the drilling machinery, and at the same time ventilated the tunnel. A channel had been cut in the solid floor to carry off the water which flowed in from various seams in the rock.

A short distance from the foot of the shaft were the stables, containing several mules, which were used for hauling the cars. The mules seemed to look at us with a desponding gaze, as if connecting us in some way with the outside world, which they would never see again.

"Did these animals," said I, "come down in the cage where we descended?"

"Certainly," said the assistant superintendent. "How else could they come down? They were sent down in that box, not all together, but only one at a time."

I endeavored to ascertain how it was possible to pack a live animal into that cage without killing him. The assistant said it was easy enough if you only knew how, and could induce the animal to do as you wanted him to. "They are good mules," said he, "and with a strong rope you can

double them up any way, though they do not exactly like it. If they live two years longer, they will get out alive, otherwise they will die here. It does not pay to be hoisting live mules out, and lowering other live mules in. When they get here, they stay till we are through with them."

We pushed along, and about half way from the shaft to the heading we passed a couple of surveyors, who were making an alignment of the tunnel, to see that everything was correct. They had the ordinary instruments used for levelling purposes in the open air, but it seemed rather odd to find them using the same instruments by the light of lanterns, and laying out the track far down in the interior of the mountain. Every foot of the work of a tunnel must be laid out with the utmost care, in order that the ends, when they meet, can be made to join perfectly.

There is a narrow track along the bottom of the tunnel, where cars are drawn by mules, for the removal of the rock to the foot of the shaft, where it can be hoisted out. My guide told me that a recent visitor to the tunnel asked, with apparent innocence, why they hoisted out all that rock, and suggested that it would be much easier to dig a hole in the bottom of the tunnel, and bury it there; but he did not suggest what should be done with the rock which they removed to make the hole. We encountered several of these cars, and at one place were crowded rather closely against the walls.

Originally gunpowder was used for blasting purposes in the tunnel, but of late years nitro-glycerine has taken its place. Experiments have been made with another substance, known as dualine, but thus far it has not proved a success, and has not taken the place of nitro-glycerine.

Several accidents with explosive materials have occurred here, one of the most serious being in 1869. The magazine where the nitro-glycerine was stored for operations on the eastern part of the tunnel, was about a quarter of a mile from the portal. Three of the miners went one morning to prepare the nitro-glycerine for the day's use, and an explosion occurred, killing them all. Two of them were inside the building

at the time, and nothing but a few pieces of them were found ; the other, who was outside the building, was so badly disfigured that it was almost impossible to identify him, and the force of the explosion was so great that not a plank or a timber of the building remains.

As we neared the heading the noise increased. The shouts of the miners and the sound of the drilling machines overpowered any ordinary tones of the voice. The drilling machine is an iron frame, resting upon trucks, and is pushed as near as possible to the face of the rock. The drills are fastened to it in such a way that they can be turned upon any designated point. They are operated by the compressed air, and work with great rapidity, striking as many as three hundred blows to the minute. The quality of the rock is generally so hard that the drills become dull and blunt in a short time, and require to be sharpened ; but they work much more expeditiously than hand drills. Under the ordinary process of hand drilling it would take six weeks to accomplish the distance now made in a single week.

When the drill-holes have been sunk to the required depth, the machine is moved back, and some plank doors are closed in front of it to prevent injury by the flying fragments of rock. Just as we reached the end of the heading the noise ceased, and the machine was drawn back, preparatory to blasting. The holes were cleared, and then three men came forward with the charges of nitro-glycerine in long tin tubes. These were put in the holes, the wires were fastened in their places, and then the men moved back ; and it is hardly necessary to say that I moved back at the same time, and quite as far as the workmen. Everything being ready, the signal was given.

" Look out that you are not blown down ! " said my guide.

I did look out. There came a sound and a quick explosion, followed by the rumbling and crashing of the rock, and then a rush of air and smoke that almost threw me over.

The miners, however, did not seem to mind it, and I concluded it was all right ; but I had much rather not be obliged to follow the observation of blasting in the Hoosac Tunnel as a regular business.

WORK AT THE HEADING IN HOOSAC TUNNEL.

The pressure of the air in the iron pipe for working the drills and ventilating the tunnel is about six atmospheres, or ninety pounds to the square inch. As soon as the blast is made, the air is turned on; the smoke from the blast is driven back, and the miners find themselves in a clear atmosphere.

After this blast it was intimated that there was nothing more to see, and we made our way out of the tunnel into the open air again, and back to the Wilson House.

From the west shaft the work is being pushed eastward, and from the east shaft it is being pushed westward. A central shaft has been sunk in the centre of the mountain, and work is being pushed east and west from the foot of this shaft. Besides facilitating the progress of the work, it is expected that the shaft will be of great assistance in ventilating the tunnel, as a strong upward current can easily be created through it.

On the 19th of October, 1867, a terrible accident occurred at this shaft. A depth of nearly six hundred feet had been reached, and thirteen men were at work below. The gasoline apparatus used for lighting the works exploded, and set fire to the buildings. The engineer was badly burned, and driven from his post, and the men perished by suffocation. The shaft was soon filled with water, but it was not until next day that the fire was extinguished so that anybody could descend. A workman named Mallory was lowered, with three lanterns attached to him. Near the bottom two of his lanterns went out, and at a signal he was drawn up nearly insensible from breathing the foul air. He said there were fifteen feet of water in the shaft, and no signs of the men. It was necessary to erect buildings and machinery to clear the shaft, and it was not until a year after that the water was pumped out, and the bodies of the victims were recovered. They were all in a good state of preservation, but crumbled to pieces soon after exposure to the air.

## XXXV.

### THE MONT CENIS TUNNEL.

**MOUNTAIN CHAINS BETWEEN NATIONS. — MONT CENIS. — CROSSING THE ALPS. — THE GREAT ALPINE TUNNEL. — LAYING OUT THE WORK. — THE ARC AND DORA. — DIFFICULTIES. — THE SURVEYS. — PENETRATING THE MOUNTAIN. — COMPLETION OF THE WORK. — THE CHANNEL TUNNEL. — ITS COST. — COST OF TUNNELS IN VARIOUS COUNTRIES.**

It has been said with truth that "mountains interposed make enemies of nations." In various parts of the world we find that mountain chains stand as barriers between different nations, and in many instances the boundaries thus formed by nature have remained unchanged for hundreds of years. On the map of Europe the most prominent mountain chain is that of the Alps, and it has stood as a separating line between nations for a long time. It is true that occasionally wars have been carried beyond these mountain chains, and conquests have been made in spite of them; but for practical purposes the chain of the Alps has been for centuries the separating line between France and Austria on the north, and Italy on the south. Sometimes the French possessions have extended to the south of the Alps, and sometimes Italy has extended her possessions to the north of that chain. Such possessions have never been held for a great length of time, and in one way or another they have fallen to the nation to whom they belonged by natural position.

Carriage roads were long since made across the Alps. In later years the railway has traversed these mountains, but the ascent is tedious and laborious, so that rapid communication was impossible. It remained for the science of the present day to overcome the obstacles which the mountains afforded, not by cutting away the Alps, but by piercing a passago through them.

More than twenty years ago the attention of the French and Italian governments was called to the necessity of a tunnel through the Alps by which France and Italy should be connected. The project was discussed for some time, and finally a convention was formed between France and Italy for the purpose of undertaking the work. Four or five years were consumed in surveys and in the contemplation of plans. All sorts of objections were made, and a list of these objections forms a humorous page. One man contended that the heat would be so great in the centre of the mountain that the men would be roasted alive while working in the tunnel. Another was positive that the noxious gases and vapors arising in the tunnel would suffocate everybody. Another contended that rivers of water would be found in the mountain so great that they would overwhelm the workmen, and convert the tunnel into an enormous spring. And so on, one after another, the objections were heaped up, and there was at one time a prospect that the work would not be undertaken.

The actual work on the tunnel was begun on the Italian side in 1857, and a little afterwards work on the French side also commenced. A great deal of labor had been performed in locating the tunnel. A mountain chain is not a single line of mountains, like a row of potato hills; but it consists of a central back-bone of mountains, with other and smaller mountains on either side, so that a chain may often be a hundred or more miles in width. Now, in piercing a chain like the Alps, it is necessary to find a way among the outlying hills on each side through the valleys of the rivers that flow from the central chain. In this way the open-air railway is brought to the foot of one of the mountains forming the great central back-bone.

But a difficulty arises in finding two of these valleys directly opposite each other. You may follow a valley until you get to the very base of one of the highest mountains of the range, but on looking to the other side you may find no corresponding valley.

It was this peculiarity of all mountain chains that greatly

hindered the location of the Mont Cenis Tunnel. After much search, the best location was found to be by following the valley of the River Arc, on the northern side, and the River Dora, on the southern. A great many surveys were made, and it was finally discovered that the Arc and Dora, in their windings, were, at a certain point, less than eight miles apart. At this point, it was evident, Nature designed — if she had any design about it — that the great work should be constructed.

In 1867, while travelling north from Italy to France, I determined to pay a visit to the Mont Cenis Tunnel. It was said to be quite difficult to obtain a permit to enter the workings; but perseverance and letters of introduction will accomplish a great deal, and after a little delay I obtained what I asked for. I found it more convenient to visit the northern end of the tunnel for the reason that on the Italian side the workings were sixteen miles away from the regular line of travel, while those on the northern side were directly on the route of tourists.

A railway over Mont Cenis was then under construction, and nearly completed; but as it was not open for travelling, I made the transit in a carriage, just as many thousands of people had made it before me. The railway over the Alps is of itself a curiosity. In some places the ascent equals one foot in ten, so that great power was required for the locomotives to enable them to drag their burdens upward. The track was narrow, and it was peculiar in having three rails instead of two. The wheels of the carriages run on two rails only, just like wheels of carriages on other railways. The central rail was intended for the use of the locomotives, to assist their power of traction. The wheels were arranged on these locomotives in such a way as to grip the central rail with tremendous force, and the brakes were also so arranged that by pressing this central rail they could bring the carriages to a sudden stop in case of accident.

The line of the railway over Mont Cenis follows very nearly the carriage road, and occasionally crosses it. In some places

it passes through short tunnels, and in others it is roofed in to avoid injury by snow. In crossing the mountain by this railway very little time is saved over the ordinary carriage route, while the latter is very much to be preferred on account of its comfort and the advantage it gives for observing the scenery. We were a party of four, and after an unhappy night in a dirty hotel at Susa, an old town founded by the Romans, and containing some ruins dating from the time of the Romans, we started on our journey.

Our night had been unhappy. Our breakfast was still more unhappy, and our bill for what the landlord facetiously termed our "entertainment" was the worst feature of all. The discomfort of his establishment was greater than the comfort of the best hotel in Paris, and he charged us about twice the rate that any Parisian landlord would dare to ask. We consoled ourselves and settled our breakfast by getting up a magnificent row with him, threatening to break his head, and talked at least fifteen minutes in mingled *patois* of English, French, Italian, Russian, and Chinese. We did not succeed in having our bill reduced, but I am confident if what we said to that landlord remained ringing in his ears for twenty-four hours, it must have driven him to hopeless insanity.

We wound slowly up the mountain, with the top of our carriage thrown back, so that we could enjoy the view.

The Mont Cenis Pass is the least interesting of all the great passes of the Alps. Tourists complain of its tameness, but there are points where it is picturesque.

At places during the ascent we had some fine views of that portion of Italy which stretches away from the base of the mountain, and we tried to imagine that we could now and then catch a glimpse of the Mediterranean Sea. The rough mountains were piled above and around us, frequently in fantastic shapes, and we found the air getting steadily more and more cool as we made the ascent.

Finally on the summit, only a few hours after leaving a tropical temperature in Italy, we were riding amid fields of snow, and shivering in our travelling coats and thick shawls.

The ascent was slow, but the descent on the French side was rapid. As we passed the boundary between France and Italy, our driver gathered his reins, and the horses went at full speed down the magnificent road. We left a cloud of dust filling the air behind us, and were whirled along so rapidly that I sometimes thought we might be tossed over one of the precipices in some of the short windings of the road. At every half mile there is a small shed, or house, known as the "refuge." It is intended for travellers who are overtaken on the mountain, during the winter season, by violent snow-storms.

As it was summer we had no occasion to seek these refuges, but it was easy to see that they were of great advantage in protecting and saving life during the severer portion of the year.

At Lans-le-bourg we stopped at the French custom-house to undergo an examination; but our baggage was so small in quantity, and we manifested such a readiness to submit it to inspection, that the officers of customs did not detain us. Behind us was a carriage, in which were two American ladies, and they drove up a few moments before we started. They had that enormous amount of baggage peculiar to their sex and race, and protested that their trunks contained nothing of value. But the custom officers were inexorable, and as we drove away, the trunks of the ladies were being unpacked, and were undergoing a rigid examination. If you wish to avoid trouble at custom-houses when travelling in Europe, never carry a large amount of baggage, and never show the least hesitation to open it for inspection. Many a time have I found my baggage passed without examination, while the next man's would be overhauled, and, as nearly as I could judge, only for the reason that he urged the officers not to look at it, and assured them that it contained nothing contraband.

At Modane we found the base of operations for the northern part of the tunnel, and here we halted to make our investigations. By the way, I never have been able to make out why the name of Mont Cenis should be attached to the famous tun-

nel, since that mountain is about twenty miles away from it. The tunnel does not pass under Mont Cenis, but under three peaks called Col Frejus, Le Grand Vallon, and Col de la Roue, the first being on the French, the third being on the Italian slope, and the second about half way between the two. I suppose, however, that the tunnel was named after Mont Cenis because it is better known than any other summit or range in this neighborhood, and because it would be better to give it a name which does not belong to it at all, rather than naming it after any one of the three peaks deserving equal distinction.

Modane, or, more properly speaking, Fournaux, was the base of operations. Fournaux is a miserable little village in a narrow gorge in the valley of the Arc, and its inhabitants are chiefly remarkable for their deformity and idiocy. The Grand Vallon is eleven thousand feet above the sea level, and crowned with snow. Its sides are steep, and it would be quite impossible to carry a railway over it. The other mountains on the route are equally rugged in character, but their height above makes little difference with the workings carried on in their interior.

The Mont Cenis Tunnel is the largest in the world, extending from Fournaux, on the French side, to Bardouneche, on the Italian side. When it was begun, with the ordinary system of hand drills, it was found that at the ordinary rate of progress, it would take thirty or forty years to finish the work. With an ordinary tunnel, where the elevation of earth or rock is not very great, shafts are sunk along the line, as before stated; but in this case it was impossible to sink these vertical shafts, on account of the great distance. A necessity arose for penetrating the rock much faster than by ordinary means, and there was also a necessity for supplying the workmen with fresh air.

These necessities led to Sommelier's invention of drills worked by compressed air, and of the machinery for compressing the air. The machines have already been described in connection with the Hoosac Tunnel. A great many experi-

ments were made before the air could be successfully used; but finally, when they were completed, the work progressed rapidly. By means of the compressors that were worked by a stream of water from the mountain, the air was reduced to one sixth of its natural bulk, and thus, when liberated, it exercised an expansive force equal to six atmospheres. The compressing machines used at most tunnels to-day are simply enormous and very powerful pumps, but the machine of Sommelier used the weight of water. Twenty or more large iron tubes were placed in an upright position. The "head" of the supply was far up the mountain side, and the water was brought to the machine in an iron pipe. A piston perfectly tight was fitted to the tube, the water was turned on, and its weight, added to the head it had received, compressed the air in the tube. As it was compressed, a valve was opened, through which it could escape into a reservoir. From this reservoir the air was conveyed in an iron pipe into the tunnel, where it was used to work the perforators.

We found that the entrance to the tunnel was quite a distance up the side of the mountain, and it was evident that considerable engineering skill would be required to bring the railway track thither when the work was completed. Opposite the mouth of the tunnel, my attention was called to a large target, made of boards painted white, and securely fastened against the rock. The target was used for the proper alignment of the work. At every foot of progress into the mountain, bearings were carefully taken. At night a Drummond light was placed in the centre of the target, so that it could be visible from the middle of the mountain.

It will be seen that it was a work requiring the utmost caution to lay out the route and direction of the tunnel through the mountain. A variation of a hundredth part of an inch at any point in the surveys would have changed the course of the working on one side or the other, so that the two ends would not meet. Bear in mind that these surveys were carried from the valley of the Arc to the valley of the Dora,—the opposite points being eight miles apart,—and the route

lying, not through level fields and meadows, but over three rough and high mountains, where there was no path beyond that which the surveyors and their assistants laid out. And yet, so carefully was the work performed from the two sides, that the workings were brought together exactly, without a variation of a single foot.

The entrance to the tunnel is about twenty-five feet wide, and the same in height. To go inside the workings, you are clad with a rubber suit, and supplied with a lamp, and accompanied by a guide. For some time after the working began, almost any one could be admitted; but it was found that the workmen were greatly hindered by frequent visits, so that the rules became very strict. No one could enter the tunnel, unless employed there, without a pass from the management, though it was not very difficult for a journalist or a person of influence or prominence to obtain admission. As fast as the work progressed, a double railway was laid down to carry in the materials used in the working, and to bring out the broken rock. There was a narrow sidewalk of flagged stone on each side. The pipes for the air were ranged along the side of the tunnel, and between the lines of the rails, in a deep trench, were the gas and water pipes.

Like all tunnels this one was damp, from the streams of water coming through the roof; and if you wondered before entering, why you should be asked to wear a rubber coat, your wonder speedily ceased. At the time of my visit the workmen were nearly three miles from the entrance, — that is to say, the tunnel was finished for that distance, — while for about a quarter of a mile the men had cut the heading, but the upper part of the tunnel had not been opened.

The heading is the most difficult part of the work, and in all tunnel operations the workmen at the heading are kept sufficiently in advance of the enlargers; so that one party will not be in the other's way.

The passage from the entrance through the finished portion was comparatively easy, but after you reached the newly-opened part you found it more difficult. There were wagons

and men moving to and fro, and fragments of rock were lying everywhere about. The space was narrow, and every little while you found yourself running much nearer a man or a mule than you wished to; unless you moved about very carefully, you were under the risk of being run over by a mule, or crushed by the wheels of a wagon.

The perforators kept up a perpetual din, and you could hardly hear yourself speak; and I have heard persons aver that you could not hear yourself think. The drill of the Mont Cenis machine stands on a carriage, which the Italians call the "*Affusto*," and it strikes about two hundred blows a minute. Its force upon the rock is about two hundred pounds.

A stream of water is thrown upon the rock into the drill-hole, to facilitate the perforating process.

The wear and tear of machinery in the tunnel were very great, owing to the hardness of the rock. Every fifteen minutes it was necessary to change the drills, and a great many *affusti* were worn out.

It was estimated that by the time the tunnel was completed four thousand machines were utterly worn out. At the entrance of the tunnel we saw a great many of these disabled *affusti*, reminding us of worn-out carriages around a stable.

With the exception that the workmen were clad in different costumes, and were shouting in French instead of English, the work was very much like that already described in the Hoosac Tunnel. Accidents were much more frequent in the Mont Cenis Tunnel than in the Hoosac Tunnel, for the reason that much less care was taken. It was said that nearly twelve hundred men lost their lives in the tunnel, or in connection with it, during the time of its construction, — at least, some of the workmen said so, — while the guides and directors insisted that the loss of life had not been more than one tenth of the number. Owing to the hardness of the rock the cost of the work was very great. Taking the average of the whole length of the tunnel, it was one thousand dollars a lineal yard, making a total, in round numbers, of fifteen millions of dollars.

BORING MACHINES USED IN MOUNT CENIS TUNNEL.

The expense was shared between the French and Italian governments, and the tunnel will form a bond of union between the two nations greater than could be made by any other use of the same amount of money. By the terms of the convention between the governments, the tunnel is to remain uninjured should France and Italy be engaged in hostilities against each other. The tunnel shortens the route of travel very materially, and where the route of travel is shortened the work of peace and good will among men is greatly facilitated.

A tunnel has been proposed for the Straits of Dover, between England and France, and several plans have been considered. The London Times stated, early in 1872, that a company has been formed and funds subscribed to the amount of some one hundred and fifty thousand pounds, with the immediate object of making a trial shaft, and driving a driftway on the English side about half a mile beyond low-water mark, with the view of proving the practicability of tunnelling under the Channel. The completion of this work will furnish data for calculating the cost of continuing the driftway from each shore to a junction in mid-channel, and capital will then be subscribed for that purpose, or for enlarging it to the size of an ordinary railway tunnel, as the engineers may deem most expedient.

The tunnel will be made through the lower or gray chalk chiefly, if not entirely, and by the adoption of machinery, of which the promoters of this company have recently made practical trials, it is expected the passage from shore to shore can be opened within three years from the time of commencing the work, and at a cost very considerably less than any previous estimates.

The same paper, referring to the proposed enterprise, gives the following details about railway and other tunnels: "The cost of existing tunnels has been governed by such various conditions of locality and soil, that they can have little bearing upon the present question. It may be worth while, nevertheless, to cite a few prominent examples. The Mont Cenis

Tunnel has cost one hundred and ninety-five pounds per linear yard, which would amount, for a length of twenty-two miles, to seven millions four hundred and fifty thousand four hundred pounds. The three most costly tunnels made in England have been the Kilsby, the Saltwood, and the Bletchingley, each of which was executed in treacherous strata, giving out large quantities of water. In making the Kilsby Tunnel a hidden quicksand was discovered, by which the works were drowned out. For a considerable time all pumping apparatus appeared insufficient, but by the employment of one thousand two hundred and fifty men, two hundred horses, and thirteen steam engines, working night and day for eight months, one thousand eight hundred gallons per minute were raised from the quicksand alone. The cost of the work was raised from ninety thousand pounds, the original estimate, to three hundred and fifty thousand pounds, or one hundred and forty-five pounds per yard for two thousand four hundred yards. The same rate of expense for twenty-two miles would amount to five millions six hundred and forty-six thousand six hundred and twenty pounds. The Saltwood Tunnel cost one hundred and eighteen pounds per yard, the Bletchingley seventy-two pounds; or for twenty-two miles, four millions five hundred and sixty-eight thousand nine hundred and sixty pounds, and two millions seven hundred and eighty-seven thousand eight hundred and forty pounds, respectively.

"The cost of railway tunnels in France has varied from thirty pounds per yard—being that of Terre Noire, on the Paris, Lyons, and Mediterranean Railway, to ninety-five pounds per yard, that of Batignolles, near Paris, on the Chemin de Fer de l'Ouest. In Belgium, Braine le Comte Tunnel cost forty-six pounds per metre, and the tunnels on the Liege and Verviers line fifty pounds per metre. In Switzerland the very difficult Hauenstein Tunnel between Basle and Berne cost eighty pounds a yard.

"In America, the Hoosac Tunnel, in Massachusetts, through mica slate, mixed with quartz, has up to this time cost one

hundred and eighty pounds per yard, and the Moorhouse Tunnel, in New Zealand, through lava streams and beds of tufa, intersected by vertical dikes of phonolite, cost sixty-eight pounds fifteen shillings per yard. It will be a convenient standard of comparison for these amounts if we remember that twenty-five pounds per yard would represent very nearly a million sterling for the twenty-two miles. Any estimate for the Channel Tunnel must at present be purely conjectural, and an estimate professing to embrace contingencies must be more conjectural than any other; but it is reckoned that the work, if practicable at all, could be completed within five years of time, and for five millions of money."

## XXXVI.

### THE PARISIAN SEWERS.

THE SEWERS OF PARIS.—THEIR EXTENT.—A JOURNEY THROUGH THEM.—THE START AND THE MODE OF TRAVEL.—DESCRIPTION OF THE GREAT SEWER.—ACCIDENTS OF SEWER TRAVEL.—HISTORY OF THE SEWERS.—THEIR FIRST GREAT INSPECTION.—BRUNESSEAU.—INUNDATION FROM THE SEWERS.—A MAN LOST.—HORRIBLE DEATH IN THE SEWERS.—THE OLD AND THE NEW.—THE EXCAVATIONS.—NATURE OF THE WORK.—BREAKAGE OF THE CANAL.—JEAN VALJEAN IN THE SEWERS OF PARIS.—HIS FIRST SENSATION.—CAUGHT IN A LABYRINTH.—THE SEWERS OF ST. DENIS, AND THE MARKETS.—CAUGHT IN THE WATER.—THE POLICE IN PURSUIT.—FRIGHT OF THE FUGITIVE.—THE QUICKSAND ON THE COAST OF BRITTANY.—A HORRIBLE DEATH.—QUICKSAND IN THE SEWERS.—HOW IT WAS FORMED.—JEAN VALJEAN IN THE QUICKSAND.—HIS SUFFERINGS AND ESCAPE.

PARIS, the gayest and brightest city in the world, has an underground life surpassing that of any other metropolis. Beneath the broad streets there are many miles of sewers constructed on a plan that furnishes a complete system of drainage. The total length of the Paris sewers is now about four hundred and thirty-four thousand yards, or three hundred miles. The length of galleries to be constructed in course of time is about two thousand yards more. To organize the network of sewers, the site of the capital has been divided into five basins, of which three are on the right and two on the left bank of the Seine.

Six great principal galleries, cutting the city nearly at right angles, and having for tributaries fifteen secondary galleries, out of which branch a multitude of galleries of less importance, constitute the principal arteries of the network. Three of the six principal galleries are on the right bank of the river: the first is that of the quays; the second descends the Boulevard de Sebastopol, and joins the first at the Place du Chatelet;

PLACE DE LA CONCORDE.

and the third runs from the Place de la Bastille to the Place de la Concorde, through the streets St. Antoine and de Rivoli.

On the left bank the first gallery includes the line of the quays from the Pont d'Austerlitz to the Pont d'Iena; the second follows the Boulevard St. Michel from the Place de l'Observatoire to the Pont St. Michel; and the third receives the Bievre, and at the Rue St. Jacques joins the long gallery into which the sewer of the Boulevard St. Michel falls.

The sewers, or at any rate a portion of them, are interesting places to visit, though nobody would care to live in them. Only a limited number of permissions are granted, and these only on stated days. I experienced considerable difficulty in securing a ticket, and it was only after exercising patience and perseverance to a liberal degree that my wishes were granted.

The ordinary route for visitors is to enter at the Place de la Concorde, or near the Madeleine Church, and come out at the Place du Chatelet. The sewer between these points is very broad and high, and is evidently the show-place of the whole system. In the centre is a canal about eight feet wide, and at its edges there are rails for the wheels of cars propelled by the workmen, who walk at the sides. The side-walks are broad and carefully swept, so that one could walk upon them without difficulty. Visitors are generally seated in the cars and pushed along by the men to whom they are expected to give some money at the end of the journey. The car moves above the canal, and every visitor is surprised at the absence of foul odors and at the general cleanliness of the place. On each side of the larger sewers, and supported on iron posts, there are large pipes for the conveyance of water, and in some places the telegraph wires and gas tubes are visible.

When everything is in order, there is very little to see, and a hundred yards or so are as good as the entire distance. The faint rumbling of the carriages can be heard overhead, but otherwise the silence is unbroken, save by the voices of the visitors and workmen, and the occasional sound of falling

water. The party to which I was assigned was a serious one, and made very little noise, compared to one a little way in advance, and containing several ladies. The presence of lovely woman can add a charm to a sewer, though I should hesitate to take a feminine acquaintance into such a place until I had first made the journey. We had no incident of importance greater than the loss of a hat, which was crushed beneath the car wheels, and the narrow escape of the owner from a tumble overboard as he attempted to clutch the falling article. The place was well lighted with gas; but I think everybody was glad to see the light of day as it streamed through the opening at the Place du Chatelet.

The sewers of Paris were begun several hundred years ago. The exact date is not known; in fact, their history is not exactly known, and some of it is mixed up with a great deal of fiction. In *Les Misérables*, Victor Hugo has given a graphic account of them, though, like much that he has written, the account is not always strictly true. (I quote his language.) He says, "The sewer of Paris, in the middle ages, was legendary. In the sixteenth century, Henry II. attempted an examination, which failed. Less than a hundred years ago, the cloaca, Mercier bears witness, was abandoned to itself, and became what it might.

"Such was that ancient Paris, given up to quarrels, to indecisions, and to gropings. It was for a long time stupid enough. Afterwards, '89 showed how cities come to their wits. But, in the good old times, the capital had little head; she could not manage her affairs either morally or materially, nor better sweep away her filth than her abuses. Everything was an obstacle, everything raised a question. The sewer, for instance, was refractory to all itineracy. Men could no more succeed in guiding themselves through its channels than in understanding themselves in the city; above, the unintelligible, below, the inextricable; beneath the confusion of tongues there was the confusion of caves; labyrinth-lined Babel.

"Sometimes the sewer of Paris took it into its head to overflow, as if that unappreciated Nile were suddenly seized with

wrath. There were, infamous to relate, inundations from the sewer. The inundation of 1802 is a present reminiscence with old Parisians. The mire spread out in a cross in the Place des Victoires, where the statue of Louis XIV. is; it entered the Rue St. Honoré by the two mouths of the sewer of the Champs Elysées, the Rue St. Florentin by the St. Florentin sewer, the Rue Pierre à Poisson by the sewer of the Sonnerie, the Rue Popincourt by the sewer of the Chemin Vert, the Rue de la Roquette by the sewer of the Rue de Sappe; it covered the curbstones of the Rue des Champs Elysées to the depth of some fourteen inches; and on the south, by the vomitoria of the Seine performing its function in the inverse way, it penetrated the Rue Mazarine, the Rue de l'Echaudé, and the Rue des Marais, where it stopped, having reached the length of a hundred and twenty yards, just a few steps from the house which Racine had lived in, respecting, in the seventeenth century, the poet more than the king. It attained its maximum depth in the Rue St. Pierre, where it rose three feet above the flagging of the water-spouts, and its maximum extent in the Rue St. Sabin, where it spread out over a length of two hundred and sixty-one yards.

"At the commencement of this century the sewer of Paris was still a mysterious place. Mire can never be in good repute; but here ill-fame reached even fright. Paris dimly realized that she had a terrible cave beneath her. People talked of it as of that monstrous bog of Thebes which swarmed with scolopendras fifteen feet long, and which might have served as a bathing-tub for Behemoth. The big boots of the sewer men never ventured beyond certain known points. They were still very near the time when the scavengers' tumbrils, from the top of which Ste. Foix fraternized with the Marquis of Créquy, were simply emptied into the sewer. As for cleansing, that operation was confided to the showers, which obstructed more than they swept out. Science and superstition were at one in regard to the horror. The sewer was not less revolting to hygiene than to legend. The Goblin Monk had appeared under the fetid arch of the Mouffetard

sewer; the corpses of the Marmousets had been thrown into the sewer of the Barillerie; Fagon had attributed the fearful malignant fever of 1685 to the great gap in the sewer of the Marais, which remained yawning until 1833 in the Rue St. Louis, almost in front of the sign of the Gallant Messenger. The mouth of the sewer of the Rue de la Mortellerie was famous for the pestilence which came from it; with its pointed iron grating, which looked like a row of teeth, it lay in that fatal street like the jaws of a dragon blowing hell upon men. The popular imagination seasoned the gloomy Parisian sink with an indefinitely hideous mixture of the infinite.

"One day in 1805, on one of those rare visits which the emperor made to Paris, the minister of the interior came to the master's private audience. In the carousal was heard the clatter of the swords of all those marvellous soldiers of the Grand Empire; there was a multitude of heroes at the door of Napoleon; men of the Rhine, of the Scheldt, of the Adige, and of the Nile; companions of Joubert, of Desaix, of Marceau, of Hoche, of Kléber. The whole army of that time was there in the court of the Tuileries, represented by a squad or platoon guarding Napoleon in repose; and it was the splendid epoch when the grand army had behind it Marengo, and before it Austerlitz. 'Sire,' said the minister of the interior to Napoleon, 'I saw yesterday the boldest man in your empire.' 'Who is the man?' said the emperor, quickly; 'and what has he done?' 'He wishes to do something, sire.' 'What?' 'To visit the sewers of Paris.'

"That man existed, and his name was Bruneseau.

"The visit was made. It was a formidable campaign; a night battle against pestilence and asphyxia. It was at the same time a voyage of discoveries. One of the survivors of this exploration, an intelligent working-man, then very young, still related, a few years ago, the curious details which Bruneseau thought it his duty to omit in his report to the prefect of police, as unworthy the administrative style. Disinfecting processes were very rudimentary at that period. Hardly had Bruneseau passed the first branchings of the subterranean

THE MADELENE CHURCH.

network, when eight out of the twenty laborers refused to go farther. The operation was completed; the visit involved the cleaning; it was necessary, therefore, to clean, and at the same time to measure; to note the entrance of water, to count the gratings and the mouths, to detail the branchings, to indicate the currents at the points of separation, to examine the respective borders of the various basins, to fathom the little sewers ingrafted upon the principal sewer, to measure the height of each passage under the keystone, and the width, as well at the spring of the arch as at the level of the floor; finally, to determine the ordinates of the levellings at a right angle with each entrance of water, either from the floor of the sewer or from the surface of the street. They advanced with difficulty. It was not uncommon for the step-ladders to plunge into three feet of mire. The lanterns flickered in the miasms. From time to time, they brought out a sewer-man who had fainted; at certain places, a precipice. The soil had sunken, the pavement had crumbled, the sewer had changed into a blind well; they found no solid ground; one man suddenly disappeared; they had great difficulty in recovering him. By the advice of Fourcroy, they lighted from point to point, in the places sufficiently purified, great cages full of oakum and saturated with resin. The wall, in places, was covered with shapeless fungi, and one would have said with tumors; the stone itself seemed diseased in this irrespirable medium.

"They thought they recognized here and there, chiefly under the Palais de Justice, some cells of ancient dungeons built in the sewer itself. Hideous *in pace*. An iron collar hung in one of these cells. They walled them all up. Some odd things were found; among other things, the skeleton of an orang-outang which disappeared from the Jardin des Plantes in 1800 — a disappearance probably connected with the famous and incontestable appearance of the devil in the Rue des Bernardins in the last year of the eighteenth century. The poor devil finally drowned himself in the sewer.

"Under the long, arched passage which terminates at the

Arche Marion, a rag-picker's basket, in perfect preservation, was the admiration of connoisseurs. Everywhere the mud, which the workmen had come to handle boldly, abounded in precious objects, gold and silver trinkets, precious stones, coins. A giant who should have filtered this cloaca would have had the riches of centuries in his sieve. At the point of separation of the two branches of the Rue du Temple and the Rue Ste. Avoye, they picked up a singular Huguenot medal in copper, bearing on one side a hog wearing a cardinal's hat, and on the other a wolf with the tiara on his head.

"The complete visitation of the subterranean sewer system of Paris occupied seven years, from 1805 to 1812. While yet he was performing it, Bruneseau laid out, directed, and brought to an end some considerable works. At the same time, he disinfected and purified the whole network. After the second year, Bruneseau was assisted by his son-in-law Nargaud.

"Tortuous, fissured, unpaved, crackling, interrupted by quagmires, broken by fantastic elbows, rising and falling out of all rule, fetid, savage, wild, submerged, in obscurity, with scars on its pavements and gashes on its walls, appalling,—such was, seen retrospectively, the ancient sewer of Paris. Ramifications in every direction, crossings of trenches, branchings, goose-tracks, stars as if in mines, cæcums, cul-de-sacs, arches covered with saltpetre, infectious cesspools, an herpetetic ooze upon the walls, drops falling from the ceiling, darkness,—nothing equalled the horror of this old voiding crypt, the digestive apparatus of Babylon, cavern, grave, gulf pierced with streets, Titanic molehill, in which the mind seems to see prowling through the shadow, that enormous blind mole, the past.

"At present the sewer is neat, cold, straight, correct. It almost realizes the ideal of what is understood in England by the word 'respectable.' It is comely and sober; drawn by the line; we might almost say, fresh from the bandbox. At the first glance, we should readily take it for one of those underground passages formerly so common and so useful for

the flight of monarchs and princes, in that good old time 'when the people loved their kings.' The present sewer is a beautiful sewer; the pure style reigns in it; the classic rectilinear alexandrine, which, driven from poetry, appears to have taken refuge in architecture, seems mingled with every stone of that long, darkling, and whitish arch; each discharging mouth is an arcade. If the geometric line is in place anywhere, it surely is in the stercoreary trenches of a great city. There all should be subordinated to the shortest road. The sewer has now assumed a certain official aspect. The very police reports, of which it is sometimes the object, are no longer wanting in respect for it. The words which characterize it in the administrative language are elevated and dignified. Villon would no longer recognize his old dwelling in case of need.

"The excavation of the sewers of Paris has been a difficult work. Paris is built upon a deposit singularly rebellious to human control. There are liquid clays, living springs, hard rocks, those soft and deep mires which technical science calls *Moutardes*. The pick advances laboriously into these calcareous strata alternating with seams of very fine clay and laminar schistose beds, incrustated with oyster shells contemporary with the pre-adamite oceans. Sometimes a brook suddenly throws down an arch which has been commenced, and inundates the laborers; or a slide of marl loosens, and rushes down with the fury of a cataract, crushing the largest of the sustaining timbers like glass. Quite recently at Villette, when it was necessary, without interrupting navigation and without emptying the canal, to lead the collecting sewer under the St. Martin Canal, a fissure opened in the bed of the canal; the water suddenly rose in the works under ground beyond all the power of the pumps; they were obliged to seek the fissure, which was in the neck of the great basin, by means of a diver, and it was not without difficulty that it was stopped. Elsewhere, near the Seine, and even at some distance from the river, as, for instance, at Belleville, Grande Rue, and the Lunière arcade, we find quicksands in which we

sink, and a man may be buried out of sight. Add asphyxia from the miasma, burial by the earth falling in, sudden settlements of the bottom, and the work of constructing sewers can well be understood to be dangerous."

In all that he has written, Victor Hugo has produced nothing more graphic than his description of Jean Valjean in the sewers of Paris, when endeavoring to escape from the police, after the fight at the barricades. We quote his description, omitting a few paragraphs.

"It was in the sewer of Paris that Jean Valjean found himself.

"A resemblance of Paris with the sea. As in the ocean, the diver can disappear.

"The transition was marvellous. From the very centre of the city, Jean Valjean had gone out of the city, and, in the twinkling of an eye, the time of lifting a cover and closing it again, he had passed from broad day to complete obscurity, from noon to midnight, from uproar to silence, from the whirl of the thunder to the stagnation of the tomb, and, by a mutation much more prodigious still than that of the Rue Polonceau, from the most extreme peril to the most absolute, security.

"Sudden fall into a cave; disappearance in the dungeon of Paris; to leave that street in which death was everywhere for this kind of sepulchre, in which there was life, was an astounding crisis. He remained for some seconds as if stunned; listening, stupefied. The spring trap of safety had suddenly opened beneath him. Celestial goodness had in some sort taken him by treachery. Adorable ambuscades of Providence!

"Only, the wounded man did not stir, and Jean Valjean did not know whether what he was carrying away in this grave were alive or dead.

"His first sensation was blindness. Suddenly he saw nothing more. It seemed to him also that in one minute he became deaf. He heard nothing more. The frenzied storm of murder which was raging a few feet above him only reached him, as we have said, thanks to the thickness of the

**THE GREAT SEWER.**

**SUBTERRANEAN PARIS.**

earth which separated him from it, stifled and indistinct, and like a rumbling at a great depth. He felt that it was solid under his feet; that was all; but that was enough. He reached out one hand, then the other, and touched the wall on both sides, and realized that the passage was narrow; he slipped, and realized that the pavement was wet. He advanced one foot with precaution, fearing a hole, a pit, some gulf; he made sure that the flagging continued. A whiff of fetidness informed him where he was.

"After a few moments he ceased to be blind. A little light fell from the air-hole through which he had slipped in, and his eye became accustomed to this cave. He began to distinguish something. The passage in which he was earthed — no other word better expresses the condition — was walled up behind him. It was one of those cul-de-sacs technically called branchments. Before him there was another wall, a wall of night. The light from the air-hole died out ten or twelve paces from the point at which Jean Valjean stood, and scarcely produced a pallid whiteness over a few yards of the damp wall of the sewer. Beyond, the opaqueness was massive; to penetrate it appeared horrible, and to enter it seemed like being engulfed. He could, however, force his way into that wall of mist, and he must do it. He must even hasten. Jean Valjean thought that that grating, noticed by him under the paving-stones, might also be noticed by the soldiers, and that all depended upon that chance. They also could descend into the well and explore it. There was not a minute to be lost. He had laid Marius upon the ground; he gathered him up, — this is again the right word, — replaced him upon his shoulders, and began his journey. He resolutely entered that obscurity.

"The truth is, that they were not so safe as Jean Valjean supposed. Perils of another kind, and not less great, awaited them perhaps. After the flashing whirl of the combat, the cavern of miasmas and pitfalls; after chaos, the cloaca. Jean Valjean had fallen from one circle of hell to another.

"At the end of fifty paces he was obliged to stop. A ques-

tion presented itself. The passage terminated in another, which it met transversely. These two roads were offered. Which should he take? Should he turn to the left or to the right? How guide himself in this black labyrinth? This labyrinth, as we have remarked, has a clew — its descent. To follow the descent is to go to the river.

“Jean Valjean understood this at once.

“He said to himself that he was probably in the sewer of the markets; that, if he should choose the left and follow the descent, he would come in less than a quarter of an hour to some mouth upon the Seine between the Pont au Change and the Pont Neuf; that is to say, he would reappear in broad day in the most populous portion of Paris. He might come out in some gathering of corner idlers. Amazement of the passers-by at seeing two bloody men come out of the ground under their feet. Arrival of sergent-de-ville, call to arms in the next guard-house. He would be seized before getting out. It was better to plunge into the labyrinth, to trust to this darkness, and rely on Providence for the issue.

“He chose the right, and went up the ascent.

“When he had turned the corner of the gallery, the distant gleam of the air-hole disappeared, the curtain of obscurity fell back over him, and he again became blind. He went forward, none the less, as rapidly as he could. Marius's arms were passed about his neck, and his feet hung behind him. He held both arms with one hand, and groped for the wall with the other. Marius's cheek touched his, and stuck to it, being bloody. He felt a warm stream, which came from Marius, flow over him and penetrate his clothing. Still, a moist warmth at his ear, which touched the wounded man's mouth, indicated respiration, and consequently life. The passage through which Jean Valjean was now moving was not so small as the first. Jean Valjean walked in it with difficulty. The rains of the previous day had not yet run off, and made a little stream in the centre of the floor, and he was compelled to hug the wall to keep his feet out of the water. Thus he went on in midnight. He resembled the creatures of night

groping in the invisible, and lost under ground in the veins of the darkness.

"However, little by little, whether that some distant air-holes sent a little floating light into this opaque mist, or that his eyes became accustomed to the obscurity, some dim vision came back to him, and he again began to receive a confused perception, now of the wall which he was touching, and now of the arch under which he was passing. The pupil dilates in the night, and at last finds day in it, even as the soul dilates in misfortune, and at last finds God in it.

"To find his way was difficult.

"The track of the sewers echoes, so to speak, the track of the streets which overlie them. There were in the Paris of that day two thousand two hundred streets. Picture to yourselves below them that forest of dark branches which is called the sewer. The sewers existing at that epoch, placed end to end, would have given a length of thirty miles. We have already said that the present network, thanks to the extraordinary activity of the last thirty years, is not less than a hundred and forty miles.

"Jean Valjean began with a mistake. He thought that he was under the Rue St. Denis, and it was unfortunate that he was not there. There is beneath the Rue St. Denis an old stone sewer, which goes straight to the collecting sewer, called the Grand Sewer, with a single elbow, on the right, at the height of the ancient Cour des Miracles, and a single branch, the St. Martin sewer, the four arms of which cut each other in a cross. But the gallery of the Petite Truanderie, the entrance to which was near the wine-shop of Corinth, never communicated with the underground passage in the Rue St. Denis; it runs into the Montmartre sewer, and it was in that that Jean Valjean was entangled. There, opportunities of losing one's self abound. The Montmartre sewer is one of the most labyrinthian of the ancient network. Luckily Jean Valjean had left behind him the sewer of the markets, the geometrical plan of which represents a multitude of interlocked top-gallant-masts; but he had before him more than one em-

barrassing encounter, and more than one street corner — for these are streets — presenting itself in the obscurity like a point of interrogation; first, at his left, the vast Plâtrière sewer, a kind of Chinese puzzle, pushing and jumbling its chaos of T's and Z's beneath the Hôtel des Postes and the rotunda of the grain-market to the Seine, where it terminates in a Y; secondly, at his right, the crooked corridor of the Rue du Cadran, with its three teeth, which are so many blind ditches; thirdly, at his left, the branch of the Mail, complicated, almost at its entrance, by a kind of fork, and, after zigzag upon zigzag, terminating in the great voiding crypt of the Louvre, truncated and ramified in all directions; finally, at the right, the cul-de-sac passage of the Rue des Jeûneurs, with countless little reduts here and there, before arriving at the central sewer, which alone could lead him to some outlet distant enough to be secure.

“ If Jean Valjean had had any notion of what we have here pointed out, he would have quickly perceived, merely from feeling the wall, that he was not in the underground gallery of the Rue St. Denis. Instead of the old hewn stone, instead of the ancient architecture, haughty and royal even in the sewer, with floor and running courses of granite, and mortar of thick lime, which cost seventy-five dollars a yard, he would have felt beneath his hand the contemporary cheapness, the economical expedient, the millstone grit laid in hydraulic cement upon a bed of concrete, which cost thirty-five dollars a yard, the bourgeois masonry known as *small materials*; but he knew nothing of all this.

“ He went forward with anxiety, but with calmness, seeing nothing, knowing nothing, plunged into chance, that is to say, swallowed up in Providence.

“ By degrees, we must say, some horror penetrated him. The shadow which enveloped him entered his mind. He was walking in an enigma. This aqueduct of the cloaca is formidable; it is dizzily intertangled. It is a dreary thing to be caught in this Paris of darkness. Jean Valjean was obliged to find, and almost to invent, his route without seeing it. In

that unknown region, each step which he ventured might be the last. How should he get out? Should he find an outlet? Should he find it in time? Would this colossal subterranean sponge, with cells of stone, admit of being penetrated and pierced? Would he meet with some unlooked for knot of obscurity? Would he encounter the inextricable and the insurmountable? Would Marius die of hemorrhage, and he of hunger? Would they both perish there at last, and make two skeletons in some niche of that night? He did not know. He asked himself all this, and he could not answer. The intestine of Paris is an abyss. Like the prophet, he was in the belly of the monster.

"Suddenly he was surprised. At the most unexpected moment, and without having diverged from a straight line, he discovered that he was no longer rising; the water of the brook struck, coming against his heels instead of upon the top of his feet. The sewer now descended. What? would he then soon reach the Seine? This danger was great, but the peril of retreat was still greater. He continued to advance. It was not towards the Seine that he was going. The saddle-back which the topography of Paris forms upon the right bank, empties one of its slopes into the Seine, and the other into the Grand Sewer. The crest of this saddle-back, which determines the division of the waters, follows a very capricious line. The culminating point, which is the point of separation of the flow, is in the St. Avoise sewer, beyond the Rue Michel de Comte, in the sewer of the Louvre, near the Boulevards, and in the Montmartre sewer, near the markets. It was at this culminating point that Jean Valjean had arrived. He was making his way towards the belt sewer; he was on the right road. But he knew nothing of it.

"Whenever he came to a branch, he felt its angles, and if he found the opening not as wide as the corridor in which he was, he did not enter, and continued his route, deeming rightly that every narrower way must terminate in a cul-de-sac, and could only lead him away from his object, the outlet. He thus evaded the quadruple snare which was spread for him in

the obscurity, by the four labyrinths which we have just enumerated.

"At a certain moment he felt that he was getting away from under the Paris which was petrified by the *émeute*, in which the barricades had suppressed the circulation, and that he was coming beneath the Paris which was alive and normal. He heard suddenly above his head a sound like thunder, distant, but continuous. It was the rumbling of the vehicles.

"He had been walking for about half an hour, at least by his own calculation, and had not yet thought of resting; only he had changed the hand which supported Marius. The darkness was deeper than ever, but this depth reassured him.

"All at once he saw his shadow before him. It was marked out on a feeble ruddiness almost indistinct, which vaguely empurpled the floor at his feet and the arch over his head, and which glided along at his right, and his left, on the two slimy walls of the corridor. In amazement he turned round.

"Behind him, in the portion of the passage through which he had passed, at a distance which appeared to him immense, flamed, throwing its rays into the dense obscurity, a sort of horrible star, which appeared to be looking at him.

"It was the gloomy star of the police which was rising in the sewer. Behind this star were moving, without order, eight or ten black forms, straight, indistinct, terrible.

"During the day a *battue* of the sewers had been ordered. Three platoons of officers and sewer-men explored the subterranean streets of Paris; the first, the right bank, the second, the left bank, the third, in the city.

"The officers were armed with carbines, clubs, swords, and daggers.

"That which was at this moment directed upon Jean Valjean was the lantern of the patrol of the right bank.

"This patrol had just visited the crooked gallery and the three blind alleys which are beneath the Rue du Cadran. While they were taking their candle to the bottom of these blind alleys, Jean Valjean had come to the entrance of the gallery upon his way, had found it narrower than the principal

passage, and had not entered it. He had passed beyond. The policemen, on coming out from the Cadran gallery, had thought they heard the sound of steps in the direction of the belt sewer. It was, in fact, Jean Valjean's steps. The sergeant in command of the patrol lifted his lantern, and the squad began to look into the mist in the direction whence the sound came.

"Jean Valjean saw these goblins form a kind of circle. These mastiffs' heads drew near each other and whispered.

"The result of this council held by the watch-dogs was, that they had been mistaken, that there had been no noise, that there was nobody there, that it was needless to trouble themselves with the belt sewer.

"The sergeant gave the order to file left towards the descent to the Seine. If they had conceived the idea of dividing into two squads and going in both directions, Jean Valjean would have been caught. That hung by this thread. It is probable that the instructions from the prefecture, foreseeing the possibility of a combat and that the insurgents might be numerous, forbade the patrol to separate. The patrol resumed its march, leaving Jean Valjean behind. Of all these movements Jean Valjean perceived nothing except the eclipse of the lantern, which suddenly turned back.

"Slow and measured steps resounded upon the floor for some time, more and more deadened by the progressive increase of the distance; the group of black forms sank away; a glimmer oscillated and floated, making a ruddy circle in the vault, which decreased, then disappeared; the silence became deep again; the obscurity became again complete; blindness and deafness resumed possession of the darkness; and Jean Valjean, not yet daring to stir, stood for a long time with his back to the wall, his ear intent and eye dilated, watching the vanishing of that phantom patrol.

"He resumed his march, and after a time felt that he was entering water, and that he had under his feet pavement no longer, but mud.

"It sometimes happens, on certain coasts of Brittany or Scot-

land, that a man, traveller or fisherman, walking on the beach at low tide far from the bank, suddenly notices that for several minutes he has been walking with some difficulty. The strand beneath his feet is like pitch; his soles stick to it; it is sand no longer, it is glue. The beach is perfectly dry, but at every step he takes, as soon as he lifts his foot, the print which it leaves fills with water. The eye, however, has noticed no change; the immense strand is smooth and tranquil, all the sand has the same appearance, nothing distinguishes the surface which is solid from the surface which is no longer so; the joyous little cloud of sand-fleas continues to leap tumultuously over the wayfarer's feet. The man pursues his way, goes forward, inclines towards the land, endeavors to get nearer the upland. He is not anxious. Anxious about what? Only he feels somehow as if the weight of his feet increased with every step which he takes. Suddenly he sinks in. He sinks in two or three inches. Decidedly he is not on the right road; he stops to take his bearings. All at once he looks at his feet. His feet have disappeared. The sand covers them. He draws his feet out of the sand; he will retrace his steps, he turns back, he sinks in deeper. The sand comes up to his ankles; he pulls himself out, and throws himself to the left; the sand is half leg deep; he throws himself to the right; the sand comes up to his thighs. Then he recognizes with unspeakable terror that he is caught in the quicksand, and that he has beneath him the fearful medium in which man can no more walk than the fish can swim. He throws off his load if he has one, he lightens himself like a ship in distress; it is already too late; the sand is above his knees.

"He calls, he waves his hat or his handkerchief; the sand gains on him more and more; if the beach is deserted, if the land is too far off, if the sand-bank is of too ill repute, if there is no hero in sight, it is all over; he is condemned to entombment. He is condemned to that appalling interment, long, infallible, implacable, impossible to slacken or to hasten, which endures for hours, which will not end, which seizes you erect,

free and in full health, which draws you by the feet, which, at every effort that you attempt, at every shout that you utter, drags you a little deeper, which appears to punish you for your resistance by a redoubling of its grasp, which sinks the man slowly into the earth while it leaves him all the time to look at the horizon, the trees, the green fields, the smoke of the villages in the plain, the sails of the ships upon the sea, the birds flying and singing, the sunshine, the sky. Enlèvement is the grave become a tide and rising from the depths of the earth towards a living man. Each minute is an inexorable enshrouding. The victim attempts to sit down, to lie down, to creep; every movement he makes inters him; he straightens up, he sinks in; he feels that he is being swallowed up; he howls, implores, cries to the clouds, wrings his hands, despairs. Behold him waist deep in the sand; the sand reaches his breast; he is now only a bust. He raises his arms, utters furious groans, clutches the beach with his nails, would hold by that straw, leans upon his elbows to pull himself out of this soft sheath, sobs frenziedly; the sand rises. The sand reaches his shoulders, the sand reaches his neck; the face alone is visible now. The mouth cries, the sand fills it; silence. The eyes still gaze, the sand shuts them; night. Then the forehead decreases, a little hair flutters above the sand; a hand protrudes, comes through the surface of the beach, moves and shakes, and disappears. Sinister effacement of a man.

"This fatal mishap, always possible upon one or another coast of the sea, was also possible, thirty years ago, in the sewer of Paris.

"The water filtered into certain underlying, particularly friable soils; the floor, which was of paving-stones, as in the old sewers, or of hydraulic cement upon concrete, as in the new galleries, having lost its support, bent. A bend in a floor of that kind is a crack, is a crumbling. The floor gave way over a certain space. This crevasse, a hiatus in a gulf of mud, was called technically *fontis*. What is a *fontis*? It is the quicksand of the sea-shore suddenly encountered under ground; it is the beach of Mont St. Michel in a sewer. The

diluted soil is, as it were, in fusion; all its molecules are in suspension in a soft medium; it is not land, and it is not water. Depth sometimes very great. Nothing more fearful than such a mischance. If the water predominates, death is prompt, there is swallowing up; if the earth predominates, death is slow, there is enlizement.

"Can you picture to yourself such a death? If enlizement is terrible on the shore of the sea, what is it in the cloaca? Instead of the open air, the full light, the broad day, that clear horizon, those vast sounds, those free clouds whence rains life, those barks seen in the distance, that hope under every form, probable passers, succor possible until the last moment; instead of all that, deafness, blindness, a black arch, an interior of a tomb already prepared, death in the mire under a cover! the slow stifling by the filth, a stone box in which asphyxia opens its claw in the slime and takes you by the throat; fetidness mingled with the death rattle; mire instead of sand, sulphurrotted hydrogen instead of the hurricane, ordure instead of the ocean; and to call, and to gnash your teeth, and writhe, and struggle, and agonize, with that huge city above your head knowing nothing of it all!

"The depth of the fontis varied, as well as its length, and its density by reason of the more or less yielding character of the subsoil. Sometimes a fontis was three or four feet deep, sometimes eight or ten; sometimes no bottom could be found. The mire was here almost solid, there almost liquid. In the Lunière fontis, it would have taken a man a day to disappear, while he would have been devoured in five minutes by the Phélippeaux slough. The mire bears more or less according to its greater or less density. A child escapes where a man is lost. The first law of safety is to divest yourself of every kind of burden. To throw away his bag of tools, or his basket, or his hod, is the first thing that every sewer-man does when he feels the soil giving way beneath him.

"Jean Valjean found himself in presence of a fontis. A yielding of the pavement, imperfectly upheld by the underlying sand, had occasioned a damming of the rain-water. In-

filtration having taken place, sinking had followed. The floor, broken up, had disappeared in the mire. For what distance? Impossible to say. The obscurity was deeper than anywhere else. It was a mud-hole in the cavern of night.

"Jean Valjean felt the pavement slipping away under him. He entered into this slime. It was water on the surface, mire at the bottom. He must surely pass through. To retrace his steps was impossible. Marius was expiring, and Jean Valjean exhausted. Where else could he go? Jean Valjean advanced. Moreover, the quagmire appeared not very deep for a few steps. But in proportion as he advanced, his feet sank in. He very soon had the mire half-knee deep, and water above his knees. He walked on, holding Marius with both arms as high above the water as he could. The mud now came up to his knees, and the water to his waist. He could no longer turn back. He sank in deeper and deeper. This mire, dense enough for one man's weight, evidently could not bear two. Marius and Jean Valjean would have had a chance of escape separately. Jean Valjean continued to advance, supporting this dying man, who was perhaps a corpse.

"The water came up to his armpits; he felt that he was foundering; it was with difficulty that he could move in the depth of mire in which he was. The density, which was the support, was also the obstacle. He still held Marius up, and with an unparalleled outlay of strength he advanced; but he sank deeper. He now had only his head out of the water, and his arms supporting Marius. There is in the old pictures of the deluge a mother doing thus with her child.

"He sank still deeper, he threw his face back to escape the water, and to be able to breathe; he who should have seen him in this obscurity would have thought he saw a mask floating upon the darkness; he dimly perceived Marius's drooping head and livid face above him; he made a desperate effort, and thrust his foot forward; his foot struck something solid: a support. It was time.

"He rose, and writhed, and rooted himself upon this support

with a sort of fury. It produced the effect upon him of the first step of a staircase reascending towards life.

"This support, discovered in the mire at the last moment, was the beginning of the other slope of the floor, which had bent without breaking, and had curved beneath the water like a board, and in a single piece. A well-constructed paving forms an arch, and has this firmness. This fragment of the floor, partly submerged, but solid, was a real slope, and, once upon this slope, they were saved. Jean Valjean ascended this inclined plane, and reached the other side of the quagmire.

"On coming out of the water, he struck against a stone, and fell upon his knees. This seemed to him fitting, and he remained thus for some time, his soul lost in unspoken prayer to God.

"He rose, shivering, chilled, infected, bending beneath this dying man, whom he was dragging on, all dripping with slime, his soul filled with a strange light."

## XXXVII.

### MERCURY.

PROPERTIES AND PECULIARITIES OF MERCURY, OR QUICKSILVER. — AMALGAMATION. — CINNABAR. — WHERE IT IS FOUND. — ALMADEN AND OTHER MINES. — CURIOUS CUSTOMS AT IDRIA. — MODES OF WORKING. — HUANCA VELICA. — QUICKSILVER MINES IN CALIFORNIA. — CALIFORNIA LAWSUITS. — WONDERFUL PROPERTIES OF SPANISH TITLES. — AN UNHAPPY ACCIDENT. — PRACTICAL VALUE OF AN EARTHQUAKE — AN UNDERGROUND CHAPEL.

ONE of the most valuable mineral substances is the one which is known as Mercury, or Quicksilver. It has many properties peculiar to no other metal. At an ordinary temperature it is a fluid. At thirty-nine or forty degrees below zero (Fahrenheit) it becomes solid, and resembles lead. At six hundred and sixty-two degrees (Fahrenheit) it boils, and is thrown out on an invisible, transparent vapor, like steam. Before it reaches the boiling point, if it is exposed to the air at a high temperature, it absorbs oxygen, and is converted into red oxide. Strong nitric acid will absorb mercury. Acids affect it somewhat, but not to any great extent. It mixes with lead, zinc, gold, and silver, and it may be separated from them by a chemical process, and be made perfectly pure. Sometimes the cheap metals are used to adulterate mercury; but the effect of this mixture is to produce an amalgam, whose adulterations can be easily detected. It is found sometimes in a native or pure form, and sometimes amalgamated with silver; but these instances are so rare that deposits of this sort cannot be relied upon as sources of supply.

Sometimes mercury is found in its natural state in cavities in the earth, so that it may be dug up in considerable quantities. The chief source of supply, however, is in the form of

cinnabar. Cinnabar is said to be an East Indian name, originally given to the mixture of the blood of the dragon with that of the elephant, and afterwards applied to the common ore of mercury. On account of its beautiful red color, known as vermilion, this ore has been worked in various parts of the world for more than three thousand years. Some of the Roman historians refer to the use of mercury in amalgamating gold; and the mines of Almaden, in Spain, which still produce cinnabar, are known to have been worked for thousands of years before the Christian era. Cinnabar consists of eighty-six per cent. of mercury, and fourteen per cent. of sulphur. It forms beds and veins in certain rocks, and in many places the rocks near the veins will have cinnabar distributed through them. When finely ground it makes a brilliant red paint, and, as before stated, is known as vermilion; and it is said that the Indians of California first called the attention of the Spanish settlers to the presence of quicksilver by their use of cinnabar in ornamenting their faces.

The most important mines of mercury in the world are those of Almaden, in Spain; New Almaden, in California; Idria, in Austria; and Huanea Velica, in Peru. There are smaller mines in Hungary, Bohemia, Bavaria, China, Japan, Brazil, and a few other countries. Formerly the Almaden mines, in Spain, controlled the quicksilver market of the globe. The owners of the mines could affect the price of the article just as they pleased. If they raised or lowered it, the other mines were obliged to lower or raise their prices.

Almaden is situated in New Castile, about fifty miles north of Cordova. Apart from its mining peculiarities, it possesses no feature of attraction, as it consists simply of one long street, built on a ridge of rock, where the cinnabar ore is found. The town has a mining school, half a dozen or more ordinary schools, three hospitals, and a liberal supply of churches, and about ten thousand inhabitants. Until about the beginning of the present century the mines were worked by convicts, who were compelled to wear chains, and were

kept at such severe toil that they never lived long. Later, however, the mines have been worked on a voluntary labor system, and employ about five or six thousand persons. Each laborer is required to toil only six hours a day. A longer exposure than this to the quicksilver is considered injurious to the health. The annual production of the Almaden mines is about two million pounds of pure metal.

The mines of Idria, in Austria, are about thirty-two miles north-east of Trieste. The town is a small one, its population being less than five thousand. Its annual production is about three hundred thousand pounds. A single shaft has been sunk to a depth of about one thousand feet. The excavations are made through horizontal galleries extended from this shaft. The descent into the mine is accomplished partly by steps cut in the rock and partly by ladders. About five hundred miners are employed. They preserved a peculiarity by wearing a uniform of their own, and, though the occupation is unhealthy, the appointment of a miner at Idria is greatly sought. The mines have been worked about four hundred years, and are the property of the government. The product of the other smaller mines of this metal throughout Europe is so inconsiderable as to have no material effect on the market. The same may be said of the quicksilver mines of China, Japan, and Australia.

The Peruvian quicksilver mines have been worked since the beginning of the sixteenth century. At the great mines of Huancavelica the ores are found in sandstone and shales along a belt of ground or rock about four hundred feet thick. Most of the excavations are open ones, and appear as if laid out without much plan or method. Accidents frequently occur, and at one time two hundred workmen were buried by the caving in of the earth. The total annual yield of the Peruvian mines is about four hundred thousand pounds.

Mercury is found in many places in Mexico, but no mines of it are now worked, the deposits not being sufficient to pay for the exploitation. The quicksilver mines of California were first opened and worked in 1845, by one of the Spanish

settlers. It was known that for a long time the Indians had made use of cinnabar to ornament their faces, and it was found that they had made pits fifty or sixty feet deep into the mountain in search of it. The first attempt made by the Spaniards in these Indian mines was to work the cinnabar ore for silver; but no silver could be found. The war of 1846 stopped the working of the mine, and nothing was done after that until 1848, when operations were recommenced on a large scale. A company of Mexicans and English worked the mines from 1850 to 1858, when they were stopped by the United States court on account of a lawsuit about the title.

The New Almaden mines are situated about twelve miles from San José, an important town fifty miles south of San Francisco. It was my pleasure to visit these mines several years ago, and learn something of the mode of working them. A small party of us took the train from San Francisco, and proceeded to San José, whence we travelled in carriages over an excellent road, which undulated just enough to make it interesting. Unfortunately for us, at the time of our visit, no work was in progress in the lower mines in consequence of one of those lawsuits for which the region is famous. Consequently we did not go down into the mine itself, but were obliged to content ourselves with an inspection of the reduction works.

I may remark, by the by, in speaking of these lawsuits of the New Almaden mine, that it is a peculiar dispensation of providential care or human cupidity to afflict every valuable piece of property in California with a lawsuit. I would not wish to assert that there is a dishonest man in all California, as the assertion might be followed by an assault on the writer by some enthusiastic resident of the Golden State; but I do say that the result of my observation was, that nothing could be found in California worth the having but that some claimant under a previous title would be sure to present himself. The New Almaden mines, as soon as their value became known, found plenty of claimants under Spanish titles and Indian titles. A great part of their revenue has been swal-

**QUICKSILVER MINES OF NEW ALMADEX.**

**BLASTING IN THE QUICKSILVER MINES.**

lowed up in legal proceedings. When all these questions shall have been settled finally, I presume some claimant will turn up who holds a title given him by Columbus or Queen Isabella, and possibly by the founder of the Christian religion. Titles in California can go back to a wonderfully distant period, and they are always so indefinite as to afford holding-ground for a legal anchor.

I do not think a single mine or very valuable property in California has ever escaped legal difficulties. A rocky island in San Francisco Bay was pointed out to me as the locality of a Spanish claim. It had stood very quietly unoccupied, and was not considered worth ten cents for any practical purpose. By and by the government wished to use it as the site of a fortification. Immediately there arose a claimant under a Spanish title, and he came very near compelling the government to pay him a handsome price for the property. I presume, if a volcanic island should be thrown up in the middle of the bay, and somebody should take possession of a piece of it, somebody else would have a Spanish or Indian title to it, or would possibly produce a title from his Satanic Majesty, who had caused the island to be made for the especial benefit of the claimant, in return for valuable services rendered in times past or present.

On reaching the mines, we proceeded at once to the Reduction Works, and were politely shown around by Mr. Butterworth, the superintendent. We amused ourselves trying to lift flasks of quicksilver, and were nearly choked with the fumes arising from the places where the ore was being reduced. The reduction works are very simple affairs. They consist of piles of brick with furnaces beneath them, and with large cavities, down which the ore is placed. The ore is roasted, and the mercury rises in vapor, and is condensed. The furnaces are, most of them, forty feet long, eight feet wide, and ten feet high, and fixed near each other. Each furnace is divided into compartments, the fire occupying one at the end and a little below the compartment, where the ore is placed. The heat does not come in direct contact with the ore, but is driven through it by means of flues.

There are several Condensing Chambers, so called, each of them eight feet long, four feet wide, and about six feet high. The chamber where the ore is placed is connected with the condensing chambers by means of a flue. Eight or ten tons of ore are placed in the furnace at one time. Seven other condensing chambers succeed the first, and the fumes are passed through one after the other, and finally into a tank, where they are condensed in water. Each chamber is so constructed that the mercury will flow into the iron tank, where it is collected and put in flasks. About sixty hours are required to extract the mercury from a charge of ore.

In spite of all precautions a great deal of mercury is lost. At the time of our visit, new furnaces had been constructed to take the place of some old ones, which had been torn down a year or two before. They showed us an immense cavity in the earth, where the quicksilver had accumulated and settled. Its weight had made places for it in some instances, while in others the ground was thoroughly saturated. These deposits were discovered quite by accident, and I was told that several tons of quicksilver had been taken from them.

One of our party became aware of the peculiar properties of quicksilver in a way that was not at all satisfactory. At the tank where the material was waiting to be placed in the flasks there were several gallons of mercury, and we amused ourselves by forcing our hands beneath the surface. The sensation was peculiar, and to most of us entirely new. Our friend was wearing a ring on one of the fingers that he thrust into the metal. The quicksilver allied with the gold, and suddenly it was discovered that the ring had turned white. His attention was called to it by our guide, who suggested that the ring must be removed instantly and heated. It was taken from the finger, not without considerable difficulty, placed upon a shovel, and heated. A goodly portion of the mercury, which had adhered to it, was driven away; but I believe the ring subsequently tumbled to pieces, and became valueless.

Men and animals employed about the Smelting Works are salivated and otherwise injuriously affected by the mercury ; but I believe no like effects are experienced in the mines. The ore is found irregularly distributed in the hills a little more than a mile from the smelting works. The vein is very irregular ; in fact, it is less a vein than a series of chambers. The mine is entered through a level, which extends twelve hundred feet into the hill. Side galleries are excavated on the line of deposits, and sometimes they follow these deposits four or five hundred feet. The earthquake of 1865 opened up several new chambers in the rock, and gave an increased value to the property—about the only property which an earthquake was ever known to benefit. Most of the laborers in these mines are of Indian or Spanish origin. They have a chapel in the mine, similar to chapels which are fitted up in the mines of Catholic countries all over the world. The chambers of the mine are occasionally used for *fêtes* and celebrations, and at such times are quite interesting.

The quantity of quicksilver produced annually at the New Almaden mine is about two million pounds. Sometimes it falls short of this amount, and sometimes exceeds it ; but the production is largely in the control of the managers, and they can raise or lower it almost at will. The stock of this company has been the subject of a great deal of speculation in Wall Street. Some men have made money by it, and others have lost. The speculations in it have been so extensive that it has become a sort of financial football, which prudent people would do well to let alone.

The New Idria mine was opened subsequently to the opening of the New Almaden mine. The mercury of New Almaden had driven that of Spain from all the American markets, and fairly controlled the world. The mine at Idria, together with mines at other places in California, produced a comparatively small amount, so that the market of the New Almaden mine was not seriously affected.

A universal system is followed over the entire globe, so far as the packages in which mercury is placed are concerned.

The Almaden mines of Spain adopted the plan of enclosing the mercury in iron flasks, containing seventy-six and one half pounds, and the example is followed elsewhere. Sometimes half flasks and quarter flasks are made; but the standard of seventy-six and a half pounds for a whole flask is universally maintained.

The greatest consumers of mercury are the Chinese, not physically, or for mechanical or chemical purposes. The Chinese use a great many paints, and especially red ones. As a natural consequence, quicksilver enters largely into their composition. Other uses of quicksilver are in the extraction of silver and gold from their ores in the amalgamating process, and also for coating or silvering the backs of mirrors. Mercury is employed in the construction of philosophical instruments, and is preferred to other fluids for filling thermometers and barometers. It is used in medicine to a considerable extent; and doubtless many of my readers are familiar with it. Its most general form is in what is known as the blue pill. Nearly all physicians prescribe it, but they always enjoin great caution in its use. One celebrated medical writer says, "Few medicines produce such a marked sense of depression, both mentally and bodily, as mercury, even of ordinary doses; and when the system is brought thoroughly under its influences, the effects become distressing."

## XXXVIII.

### GUANO AND THE COOLIE TRADE.

GUANO AND ITS CHARACTER. — WHERE IT IS FOUND. — THE CHINCHA ISLANDS AND THEIR WEALTH. — NOVEL PLANS OF THE PERUVIANS. — HOW THEY DIG AND LOAD GUANO. — EFFECT OF GUANO ON A STRANGER. — JARVIS'S AND HOWLAND'S ISLANDS. — THE COOLIES AND THEIR LABOR. — STORIES OF HORRIBLE CRUELITIES. — HOW THE ASIATIC SLAVE TRADE IS CONDUCTED. — MUTINY ON SHIPBOARD. — MURDER OF THE CREW. — HUMAN MINCE MEAT. — TREATMENT OF COOLIES AT WORK. — EXTENT OF THE COOLIE TRAFFIC. — PROBABLE FATE OF MISSING SHIPS.

THE exhausting effect of agriculture, in many localities, renders it necessary to furnish the soil with enriching materials. From time immemorial, use has been made of the excrement of animals, of deposits in bogs and swamps, where vegetable matter has decayed, and of various mineral substances known to contain ingredients nutritious to growing plants. An important ingredient of nearly all manures is the substance known as ammonia, which is contained in large quantities in the excrement of birds. Any farmer will tell you that the space beneath his hen-roost furnishes a material more valuable, pound by pound, than any other part of his barn-yard establishment. In some parts of the world the excrement of birds is found in large quantities, but these places are few in number, for the reason that they are only in districts where there is no rain. In localities subject to rain, although the birds may be numerous, the valuable material is washed away, or, at all events, is so greatly reduced in quality as to render it worthless or nearly so.

The great deposits of bird excrement, popularly known as guano, are in tropical regions, the most important of them being at the Chincha Islands, which are situated in the Pa-

cific Ocean, near the coast of Peru, in latitude  $13^{\circ} 38'$  south, longitude  $76^{\circ} 28'$  west. They are three in number, and are small, rocky, and perfectly dry. They appear to have been formed by separate inundations of lava under great pressure, and are composed of a gray and reddish colored rock that in some places presents a perpendicular wall three hundred feet above the surface of the ocean. The islands have a wild and picturesque appearance. Immense flocks of sea-birds are constantly flying around them. The walls of the islands are full of caves and arches, some of them very high, and the beating of the waves in the caves and arches can be heard a long distance.

The islands are small, no one of them being more than a mile in length. The total amount of guano upon them is estimated at forty millions of tons. It has been accumulating during thousands of years. In some places the depth is estimated at more than a hundred feet, and over nearly all the extent of the islands it is rarely at a depth of less than sixty feet. The value of guano was well known to the Peruvians of ancient times, and these immense deposits were specially cared for by the government. By command of the incas of Peru no person was allowed, under penalty of death, to visit the islands during the breeding season of the birds, and the same penalty was inflicted upon those who killed birds at any time of the year.

According to the histories, five hundred years were required for the formation of a single inch in thickness of guano; consequently, the time required for the formation of a layer of guano a hundred feet thick must be something more than the period of life allotted to Methusaleh, or any of his contemporaries.

The attention of Europe was first called to guano in 1804, by the great traveller Humboldt. He caused the substance to be analyzed, and found that it was composed of phosphates of ammonia, lime, and urate and oxalate of ammonia, together with other organic matters not determined. A few years later further attention was called to it by Sir Humphry

Davy, who suggested that it might prove valuable to farmers; and it was soon after tried at St. Helena. The first shipment ever brought to Europe was in 1840, and consisted of twenty casks. It was tried, and found useful; and the next year several cargoes were taken to England, and several more to the United States. The exclusive right of digging and shipping guano for the term of nine years was sold at this time, by the government, for forty thousand dollars; but it was repudiated soon after, as the increased demand for guano developed its immense value. The monopoly was, however, revived in a little while, one firm being allowed the exclusive trade with England, and another with the United States. The demand increased so rapidly that a great many ships went into the carrying trade, and sometimes as many as two hundred ships have been waiting at the Chincha Islands for their cargoes.

Explorations were made for other deposits, and some rich ones were found on the Lobos Islands, off the north coast of Peru. A great many smaller islands were found to be covered with guano, and in various parts of the Pacific Ocean there are extensive deposits. The most important of these are upon Jarvis's, Baker's, and Howland's Islands, situated in the South Pacific Ocean, belonging to a New York company, and named after American merchants interested in them. Jarvis's Island was estimated a few years ago to contain nearly four millions of tons; the quantity on Baker's and Howland's Islands was not determined.

To show the rapid increase in the demand for guano, it may be mentioned that, in the year 1841, six thousand five hundred tons were exported from the Chincha Islands, and in the five following years, one hundred and twenty-seven thousand tons were exported, — or an average of more than thirty-five thousand tons a year.

In 1849 the exports of guano were nearly a hundred thousand tons, and from 1852 to 1857 the yearly average was more than two hundred thousand tons.

The value of guano varies according to the demand, but is

ordinarily fixed at about seventy dollars a ton. It is sufficiently valuable to induce enterprising men to adulterate it; and more than half the guano sold in England and the United States is said to be mixed with inferior substances before it reaches the consumer. Nearly all dealers who purchase large quantities require a careful analysis of samples before they close their bargains. The analysis of guano is very desirable for the farmer, in order to indicate the best method of applying the fertilizer, and to ascertain for what crops and to what soils each kind is best adapted. For example, some soils might be most benefited by the Peruvian guano, which contains large quantities of ammonia; while others would be most benefited by the cheap qualities, which contain larger quantities of phosphate. Full details respecting the guano trade and the use of guano are contained in the document accompanying the message of the President of the United States to the Senate, February 5th, 1859.

Another locality where guano is found is in the Caribbean Sea, near the coast of Venezuela; but the islands containing this guano are in the region of tropical rains, and consequently the substance formed there is quite different in character from the dry, pulverized guano of the Chincha Islands. Some of these Caribbean islands are low, and covered with sand, shells, and other substances, in which the birds lay their eggs. Others rise in peaks to the height of several hundred feet; and on these peaks there are rocky layers which have been formed from guano. These rocky layers contain large quantities of phosphate and carbonate of lime. Other layers contain very little carbonate and a larger proportion of phosphate. Another variety is a solid rock, which forms a crust sometimes two feet thick, and consists mainly of phosphate and sulphate of lime. The evaporation of the ammonia and similar substances renders this rock porous, and has led many to believe that it was of volcanic origin. The heat and moisture of the surface have made wonderful changes in the organic substances or deposits of these islands; though the formation of these rocks can be directly traced to the excrement of birds and

the remains of the birds themselves, all vestiges of animal life have disappeared, and the substance presents all the characteristics of a metamorphic rock, dug from the base of a volcanic mountain.

The work of handling guano is not the most delightful in the world; especially is this the case at Chincha Islands, where the air is dry, and the guano is in the form of dust, or of a hard material which easily separates into dust. Guano has a very pungent character, and causes the eyes to inflame, and sometimes deprives them altogether of the power of sight.

As before stated, the Chincha Islands number three only, and are known as North Island, South Island, and Middle Island. The Middle Island is the most important, not only for having the largest quantity of guano upon it, but also for being the residence of the commander and deputy commander of the three islands. The palace of the commander is rather an imposing building of its character; and at a little distance stands that of the deputy commander. This is more modest and unpretending in architecture, being nothing more nor less than what Americans would term a flat-roofed shanty, constructed of cane and rush matting.

The average height of the rock which is the sub-strata of the island, is from one hundred and fifty to two and three hundred feet; and upon these rocks lie the guano as upon a scaffolding or platform rising out of the sea. The guano on this island lies on what may be termed a smooth, rounded mound, and is in some parts about one hundred and sixty feet thick. More than forty acres have been cut away from the side of the hill nearest to the vessels on which the guano is shipped. The birds which live and die upon these islands are principally of the Photo-Huenco species, and resemble blue and white pigeons with red bills. The white birds keep themselves separate from the blue, and hundreds of acres of land are completely covered with them. In addition to these, there are a number of sealions also to be found on these islands, which contribute somewhat to the quantity of ammonia created by the birds. Eggs and wings of birds, and teeth

of sea-lions, are seen in abundance changed into ammonia in each and every part of the islands.

The guano, when exposed to the air, is of a reddish brown-yellow color, which covers the whole of the three islands, and nothing else is to be seen but the rocks on which it rests. In substance it is like light, dry earth, and is very difficult to walk upon. Frequently one finds himself sinking ankle and knee deep; and should you attempt to hurry, you are almost sure to lose your footing. Should you fall and get covered with this ammonia, it matters but little, as it is pure, and contains no animal substance to make it disagreeable. If you penetrate a few feet below the surface of the ammonia, it is found to be perfectly compact, and not unlike castile soap.

The men employed to dig the guano are Chinese. They have a very hard time of it; and in addition to being hard worked, they are very badly treated. Close to the residence of the deputy commander a number of the coolies are engaged digging out the guano for shipment. The gang is superintended by the most unfeeling task-masters, who apply the lash very freely to the naked backs of the workmen on the slightest pretence. It is by no means an unfrequent occurrence to see half a dozen coolies lying about the scene of operations dead, or in their last throes of agony; and not the slightest sympathy is extended to them in their suffering. Bodies are left exposed all day in the open sun, where they may be found covered with flies or vermin; and sometimes in a few hours there are large holes in these bodies, pecked by hundreds of birds.

At the edge of the principal cutting on Middle Island, coolies are found working with their pickaxes, while others convey the guano in barrows to the side of the cliff where the vessels are in readiness to receive it.

There are about fifteen hundred men constantly engaged in cutting out the guano. As above stated, these men are coolies, and the overseers are negroes, stationed at short distances apart, and provided with heavy whips. The coolies work with no other covering than a thin pair of pantaloons.

As they are lashed by their task-masters, their cries are painful. The officers are frequently eye-witnesses of these tortures, but give them very little attention.

As soon as the guano is dug up, it is carted to the depot or open enclosures called the Margueras, and thence to the launches or vessels. These margueras are made of strong canes, resembling a palisade round a prison, and are supported by chain cables. In some parts of the islands, when the distance is far from the depot, the guano is conveyed there in cars drawn by donkeys, but generally the coolies have to wheel it themselves. Each man is expected to dig and wheel five tons of guano per day, and if he does not do this amount of work, he is severely flogged in the presence of his fellow-workmen at the close of the day's labor. The extent of punishment is always left to the discretion of the task-masters, who appear to be destitute of mercy. The men are paid one real (twelve and a half cents) per day, and their rice; but should their task not be completed, in addition to the flogging, the defaulter has part of his wages deducted.

While at work they are compelled to wear thick bandages over their mouths, owing to the strength of the ammonia. When the guano is wheeled to the depot, it is pushed down to the lower end of the margueras, where there are a number of openings connected with shutes, or long canvas pipes. These shutes are about the size of an ordinary barrel, and lead down to the base of the hill or cliff, and then into the vessels.

Sometimes the ships are loaded from the side, the guano being hoisted in bags; but this process of loading occupies too much time, and is never resorted to except in cases of necessity. When the guano is poured directly into the hold, a vessel can be loaded in a day or two; whereas, by hoisting it in, it occupies as long as two or three weeks to make up a cargo.

While the ships are being loaded, — and generally there are a large number at the same time, — they present a very interesting appearance. An ordinary visitor would at first imagine

that they were on fire, owing to the yellow smoke or dust which rises during the loading.

The air is so thoroughly impregnated with the ammonia that at times one might reasonably think he had a bottle of strong hartshorn under his nose, and most people suffer much from the effect it has upon their eyes and lungs. It has often been the subject of remark how the coolies can stand this great tax upon their eyes and lungs daily, particularly when they are so hard worked. The digging of guano is much harder than that of ordinary railway digging and mining work.

When a vessel has received its full cargo, there is a little rejoicing, and the men are permitted to leave their work for a short time. One of the crew of the loaded vessel goes to the yard-arm in a tub; three cheers are given by all the other ships, and their guns are discharged.

The coolie laborers are required to work every day in the week, Sundays included, excepting those laborers under the immediate charge of the commander. If there is a rush in getting the vessels loaded, and it becomes necessary for his men to work on Sunday, he pays them extra for their labor; but it is not so with the other laborers.

On the islands there are several rude huts, where reside doctors, overseers, and nondescripts of various sorts. There are also several groceries, cooking stores, candy shops, and various sheds, which present a picture of a small village of hovels.

The men complain that they have no protection afforded them, and their emaciated appearance goes to show that they are not over fed, and are badly used.

There is hardly a laborer to be found on the whole islands without large welts on his back, made by the thongs of the task-master. The men present a striking similarity to a used-up horse, their bones almost protruding through their skin. The small pittance that these coolies earn is kept from them, and when one of them has served the time mentioned in his contract, he finds his master has a claim against him for luxuries supplied during his term of service, and being unable to pay him, he has to resume work, as before.

BURNING OF A COOLIE SHIP.

Few get any rest whatever, and they may be said to live and die like dogs. No women are allowed among them, and being thus deprived of feminine society, in addition to their other sufferings, many commit suicide, believing that their spirits will wake in their native land.

The history of the coolie trade may be found interesting in this connection.

In the year 1847, a Portuguese vessel, named the *Don Pedro*, was in the port of Macao, China, waiting for a cargo. The captain found that it would be several months before a new crop of tea would come in, and consequently he would be obliged to wait some time before his ship could be loaded. While loitering about Macao he fell in with a Spaniard who had come over from Peru on business, and the conversation happened to turn on the cheapness of labor in China. It occurred to the Spaniard that it would be a good thing to take a thousand Chinese to Peru, and finally it was decided to attempt to load the *Don Pedro* with these men. Whether they made any contract with the coolies is not known, and probably will never be ascertained. Three hundred men were engaged ostensibly for Java, and on the 1st of June, 1847, they sailed from Macao, supposing they were going to Java, but really destined for Peru.

The ship was steered across the Pacific, and after a voyage of more than a hundred days, with a great many vicissitudes, on very short allowance of food and water, the coolies were landed in Peru. Owing to some misunderstanding and some difficulty about the contract, this first consignment was not taken to the Chincha Islands, but was placed on a plantation near Callao. They had been secured for five years' labor, and the Spaniard who brought them from China disposed of his merchandise to such good advantage that he immediately returned for another cargo. Not only did he go for another cargo, but for several cargoes, and the story of his success, and the advantages to be obtained by coolie labor, spread rapidly through South America, Australia, and other parts of the world.

The trade increased with wonderful rapidity. Rumors went about in China that the coolies were taken to the other side of the world, and were murdered as soon as their labor contract was ended. In consequence of this rumor it was difficult to obtain men voluntarily, and the dealers were obliged to buy or steal men. A system very much like the African slave trade, with a few additional horrors, speedily grew up.

The Portuguese and Spanish traders at Macao established slave pens, like those in Africa, and bought men and women just as they might buy cattle. Bands of robbers went into the country, seized the men at work or at their houses, bound and forced them into boats, took them to Macao, and sold them. Robbers infested the mountains, stealing men in preference to anything else. Sometimes fathers and mothers sold their sons, and sometimes an enterprising youth brought his able-bodied father to market, sold him to a trader, and went home with a fortune of ten dollars in his pocket.

The price varied from five to ten dollars a head. Sometimes there was a scarcity in the market, and prices advanced; and then again would come a "bear" movement; large quantities would be offered, and prices went down.

Chinese junks, known as lorchas, were sent up the bays and rivers to bring away the marketable inhabitants of the rural districts. From Macao the traffic was carried to other ports, so that five years after the first voyage of the Don Pedro, vessels were waiting for cargoes of coolies at half a dozen ports.

A writer on China says, that about this time "the coolie trade caused a civil war in some of the provinces, just as the slave trade causes a constant warfare between various tribes in Africa." During the most prosperous years of the coolie trade the mandarins and village chiefs used to connive at the robberies, and sometimes they sent their personal attendants to assist in the capture of citizens of their own town.

If they had a spite against any one, or considered that he ought to be out of the way, they combined business with pleasure by assisting to sell men to the coolie traders.

In 1854 the extensive traffic and the cruelties practised came to the ears of various governments; one after another the civilized ones forbade their ships to engage in it, and from that time the business declined, though it by no means entirely died out. The wholesale capture and sale of men have been greatly restricted, and at the present time the traffic is confined to Macao, where prisoners taken in the civil war are sold, and where certain captives taken by the lorchas find a market.

One mode of obtaining men is by coaxing them into gambling-houses, and inducing them to play for money until they have lost an amount beyond that they have about them. They are then required to sign bonds which hold them as securities for their debts. With these bonds they can be turned over to a coolie-trader, who has a depot or private jail of his own, where he locks up his human securities. When a sufficient number is accumulated, the men are sold to the exporters.

From 1847 to 1870, the number of coolies or forced laborers taken from China to Cuba was one hundred and thirty thousand, to Peru two hundred thousand, and to Australia, Java, and other parts of the Indian Ocean, about fifty thousand. These do not include voluntary emigrants, nor any of the coolies taken to India or the Sandwich Islands; neither does it include a good many ship-loads known to have been sent away, but of which no record exists. Together not less than half a million coolies — and some persons, familiar with Chinese affairs, say nearly a million — have been taken away by this Asiatic slave trade. The men are bound by contracts to a service of eight years, the contract stipulating that at the end of that time they are free to return to their homes, that they shall receive a certain amount of money, and their return passage shall be paid; but such are the cruelties practised in Peru, Cuba, and other countries, that not one man in five hundred ever returns to China.

The treatment of the coolies on shipboard is quite as severe as that of African slaves. They are crowded densely

together. Frequently they are chained or loaded with irons, and the food and water which they receive are in very small quantities. Hundreds of them die on the voyage, and hundreds and thousands more live but a short time after arriving at their destination, especially at the Chincha Islands, where they are, or were until quite recently, made to perform tasks which speedily drove them to despair. They were cruelly whipped, and to escape their tortures thousands put an end to their lives. Many committed suicide by jumping into the sea. One day in 1856, three hundred and forty-two coolies committed suicide in this manner. Two hundred of them walked into the sea together, and were drowned. It can be readily understood that the treatment they received was of the severest character, to drive them to kill themselves.

Several coolie ships were never heard from after their departure from China for Peru. Sometimes it happened that the coolies mutinied; and when defeated in the attempt to take possession of the vessel, the entire party jumped overboard, and were drowned in the sea.

In several instances the attempted mutiny was successful, and the vessels were burned, sunk, or abandoned, at some of the islands.

In 1857 a cargo of coolies murdered the officers and crew of the ship, and then drifted helplessly about the ocean until two thirds of them were dead through starvation, and the remainder were scarcely alive. The vessel was stranded on a sand-bar, near one of the Fiji Islands. Another ship was captured by the coolies and carried southward, where she went ashore on one of the islands, and all that remained alive on board at the time of her destruction were eaten up by cannibals. Horrible stories are told of the fights between the coolies and crews of ships. In case of a mutiny both sides fight with desperation, as they know it is a matter of life and death. If the coolies are overpowered they are killed or commit suicide. If the officers and crew are overpowered, they are killed, and their bodies thrown into the sea.

COOLIES PLANNING A MUTINY.

MUTINY ON THE LOWER DECK.

In one instance the bodies of officers and crew of a coolie ship were literally cut into mince meat before being thrown overboard. One of the survivors afterwards stated that there was not a piece of any one of the murdered persons that weighed more than two or three pounds, when the mutiny was ended.

On one occasion a ship sailed from Macao, and had made nearly two thirds of the voyage to the Chincha Islands when a mutiny occurred. The fight was long and severe. A part of the crew were surprised and killed on deck, the remainder were below and suffered great torture for several hours. The coolies obtained complete possession of the ship, and one by one the prisoners below were brought up and murdered.

When this work was ended the men turned the ship's head to China, and for days drifted in a helpless sort of way, knowing nothing about navigation, and allowing the sails to be blown to pieces, and the ship rendered helpless.

After nearly two months floating about, they finally arrived in one of the ports of Japan. On the voyage they had several times quarrelled among themselves, and their quarrels had led to bloodshed, in which many of their number were killed. The survivors were arrested and taken to prison by the Japanese. They were finally sent back to China, to be dealt with by their own authorities. Some of them were executed, and others were imprisoned for various periods.

## XXXIX.

### AVONDALE.

THE GREAT CALAMITY IN PENNSYLVANIA. — ITS CAUSE. — DISCOVERY OF THE FIRE. — SCENES AT THE MOUTH OF THE MINE. — BURNING OF THE BREAKER. — DESCRIPTION OF THE FIRE. — EFFORTS FOR RESCUE. — THE DOG AND LAMP. — DESCENT OF THE SHAFT. — WHAT THE EXPLORERS SAW. — DISCOVERY OF THE BODIES. — AFFLICTION OF FATHER AND SON. — BRINGING OUT BODIES. — BURIAL OF THE DEAD.

IN a former chapter a brief allusion was made to the terrible disaster at Avondale, Penn., where nearly three hundred lives were lost. Public attention was everywhere called to the disaster at the time of its occurrence; the daily and weekly journals were filled with details of the incidents at Avondale, and the illustrated papers vied with each other in giving pictorial representations of the horrifying scenes. To many readers the accounts of the time are doubtless still fresh in memory, and will remain so for years to come.

Avondale, the scene of the catastrophe, is about four miles from Wilkesbarre, and the same distance from Plymouth, and is situated on the right bank of the Susquehanna, in Luzerne County. Near Avondale the scenery for some distance is quite pleasing to the eye, and has often been praised by tourists. At the time of its occurrence the accident was called "The Unparalleled Disaster," and very properly so, for never before and never since has it seen its equal in the United States.

The fire broke out on the morning of Monday, the 6th day of September, 1869. It was thought by many persons that the fire was the work of an incendiary, and to this day there are some who adhere to this theory, although no evidence was ever obtained to warrant such a belief. The idea rose

from the fact that, for nearly two months before the disaster, the miners had been on a strike for an increase of wages, which their employers had refused to grant, and the men were compelled to give up the contest in consequence of the exhaustion of their funds. It was on the first morning of the resumption of work inside the mine that the fire broke out, and at a time when nearly three hundred men and boys were at work.

The Avondale Mining Works were built in 1867, and at the time of their destruction yielded a supply of about four hundred and fifty tons of coal daily. The mouth of the mine is two hundred feet up the side of a mountain, and over it was erected a large building, known in mining parlance as the "breaker." Here were also the engine-rooms, and the machinery for breaking and screening coal as it comes up from the mine. Above this entrance the ground rises at an angle of forty-five degrees, the town of Plymouth lying to the north. From this point there is a charming view of the valley of the Wyoming. On both sides of the mine are mountains, which stretch far away to the north and south, while meadows and gardens slope gently to the edge of the river, which meanders through the valley.

About eight o'clock on the morning of the disaster, some boys, working in a field near the breaker, observed a bluish vapor rising, but paid no attention to it, knowing that the miners had resumed work. An hour or so later the keeper of the stables in the mine took a quantity of hay for his mules down the shaft, and on his way nothing attracted his attention; but as soon as he reached the bottom he discovered fire. He at once gave an alarm: and at the instant his cry was heard, a column of flames shot with terrific fury up the ventilator and into the engine-room. So great was the heat, that, before the engine-man could reverse or stop the engine, he was driven from his post, and in a very short time the breaker and out-buildings were a mass of flames. The hoisting apparatus, the only avenue for the escape of the miners, was completely destroyed, while there were two hundred and fifty persons below. The only way to get air into the shaft was through

the main opening, — in fact, the only opening, — and this was found to be partly filled with burning timbers and *débris*. Before the flames could be stopped the shaft was partly filled up, and all communication with the miners was cut off.

Immediately after the fire broke out there was the greatest excitement around the entrance to the mine. For a time everybody appeared to have lost his reason, and men were rushing to and fro, not knowing what to do. But this state of things did not last long, and confusion speedily gave place to order, or at any rate as much of it as could be expected at such an occurrence. Despatches were sent to different places, and soon the fire departments of Scranton, Wilkes-barre, Kingston, and other cities were on their way to the scene of the conflagration, where, it is needless to say, they did good service, and were gladly welcomed. In a few hours thousands of people were journeying to the Avondale mine, some as sight-seers, and others to render what aid they could to the poor fellows known to be below. The neighboring mines suspended operations, and master and men joined heartily in the work of rescue. When the fire department arrived, it was thought impossible for the men below to be alive, as they were supposed to have been suffocated; yet there was a hope of their reaching some retreat in the inner chambers of the mine, and it was determined to lose no time in attempting a rescue of the miners at all hazards.

The shaft, which was lined with wood, was ten feet by sixteen feet square, and about three hundred and fifty feet deep. A partition extended from the top to the bottom, forming a flue for the foul air to pass out of the mine. It was up this wooden box or chimney that the fire first came, and, as it was separated from the main shaft, the stable-man could not discover the fire on his way down.

In order to purify the air in a coal mine like the one at Avondale, it is necessary to force out the foul vapor: and, in addition to the fans used, it is customary to build fires at the bottom of the shaft, in order to get rid of the "damp." When the mine is in operation these fires are never allowed

to go out. When work is resumed after a suspension, care is necessary in kindling the fire. As before stated, there had been a strike among the miners, and work entirely suspended at the mine. The fire at the bottom of the shaft had gone out, and when work was resumed, it had to be rekindled. When it was relighted, the blaze flashed up before any coal had been placed upon the wood. It was supposed that the wooden lining of the shaft caught from the blaze, although there were several feet of brick-work at the bottom. With a strong current of air, the flame immediately rushed up into the engine-room, setting fire to everything combustible in its way. The appearance of the fire, to one who could forget the peril of the men in the mine, was grand in the extreme. When it was at its height, the flames rose a hundred feet and higher. They were swayed by the wind, and could be seen now at an angle of forty-five degrees, and then almost perpendicular, while dense clouds of smoke rose and filled the air. As the day drew to its close, the excitement of the scene increased. For many miles up and down the beautiful valley the glare of a thousand lights was visible. The vast quantities of coal that had caught fire in the breaker were covered with sheets of colored flame, and occasional flashes added to the glare that lighted up the valley.

While preparations for entering the mine were in progress, hundreds of eyes were in tears, and the air was filled with the shrieks and sobs of those whose relatives and friends were below. As soon as the firemen could get to work, they began operations by sending a stream of water down the burning shaft in order to extinguish the fire; but for a long time the flames seemed to defy their efforts, and it soon became evident that the water supply was a very meagre one. It was also found very difficult for the firemen to work, as the location was upon a steep hill-side. In a few hours after the outbreak the shaft was completely choked up, for a distance of forty feet, with rubbish. Most of the day was taken up in endeavoring to clear away the *débris*, so that the engines might be used.

While all this preparatory work was going on, the throng of miners and workmen increased, and the hill was crowded with people. Meetings were organized for various purposes, and at one of them fifty experienced men were selected to enter the mine as soon as it was practicable to go there. Among these men three were owners and superintendents of adjacent mines; they volunteered their services, and were ready to die, if necessary, in the effort to rescue their fellow-miners, and subsequently some of them barely escaped death.

About half past five P. M., most of the timber and rubbish had been cleared away, and a dog and lamp were sent down the shaft to test the condition of the air. The cage was lowered as far as possible. When it came back the dog was alive, and the lamp was still burning. At half past six a man went down in a bucket, and returned in about seven minutes. He was able to breathe, but could not get beyond the obstructions. Soon after his return two men went down with tools, and, after clearing away the obstructions, they returned safely. While they were down they went through a gangway sixty or seventy yards, and came upon three dead mules lying near the stables. Then they came to a door which led into the mine, and, although they shouted and struck upon it repeatedly, they obtained no reply, and there were no indications that any of the imprisoned men were alive. Clouds of sulphurous gas were pouring out of the mine; so the men retreated.

Again another party descended to make explorations, but they were obliged to retreat, owing to the foul air and "black damp," and by the time they reached the top they were partially overcome. An engine was then rigged for the purpose of driving a fan at the mouth of the shaft, so as to force in air through a canvas hose, as the "choke damp" was found to be three or four feet deep at the bottom of the mine. One gang of men from the Scranton mines also suggested that an attempt should be made to drive a gangway from a neighboring mine into the Avondale; but it was found that it would take too long to cut through the solid rock, and the suggestion was not carried out.

After the engine had been put at work forcing air down the shaft, another party descended into the mine. They penetrated through the gas about seventy-five feet, and found the large door leading into the mine open. They went for some distance farther, and in one of the passages found a small door closed. They reported that, had the door been open, there might have been some hopes for the men, as the gas, and fire, and smoke would have had a free passage around the circuit and out again. Owing to the presence of a large quantity of gas and sulphur, the explorers had to retire, and were more or less affected by it, one of the men being overcome and almost insensible for some time after coming out of the mine.

After a consultation, a fresh party of volunteers were sent down, and when they came back they stated that they had made an important discovery. They said all efforts had been made to extinguish the fire in the shaft and send in air, it being thought that the fire in the furnace had been drawn out by the miners on the first alarm. It was found, however, that the furnace was full of coal and burning, and that a pile of coal had just caught fire and was blazing. Consequently the air sent down the shaft had not only swept over this fiery surface, but must have carried the gas and smoke to the inner recesses of the mine, and caused the death of every one of the unfortunates. A change of operations was to be considered, and all hope of getting to the men that night was abandoned.

During the night efforts were made to extinguish the fire in the furnace and beyond it, as nothing could be accomplished until this was done. A hose was let down the shaft, and four men descended. They were gone about twenty minutes without being heard from, and there was considerable anxiety for their safety. At last they gave a signal, and were brought up. They could not fix the hose, owing to the foul air, but reported that the fire appeared to be dying out.

The next day another party went down, although those outside had given up all hope of seeing any of the miners

alive. On the return of the explorers, they reported the air to be less foul, and they had arranged the hose so as to throw the water against the roof at a great pressure, and allow it to fall on the furnace. Another visit was shortly made. The fire, though still burning, was much less, and the hose was hoisted so as to get at the flames. The heat at this time was very great, and the explorers were much fatigued, and had to be brought up, one of them being insensible.

On the next journey the fire had still decreased, and while the party were down the cracking of the roof of the tunnel was heard, and part of it fell from the effects of the cooling water. The noise of the falling roof was heard outside, and the party were loudly cheered as they came up the shaft safe.

Throughout the second day efforts were made to get at the bodies of the men, but this was found impossible until the fire and foul air could be controlled, as the men could not remain down the shaft for any length of time. At midnight of the second day a party went down to throw more water on the fire, and reported that in a few hours all would be safe for entering the mine.

At two o'clock on the third morning the atmosphere was found greatly improved, and the fire nearly extinguished. The party who went down this time succeeded in getting to the stables, and there came upon the first two bodies of those known to be below. When light was procured, the bodies were unrecognizable, their features being blackened and distorted. One body was evidently that of a middle-aged man, and the other of a young man about eighteen. The explorers were brought up the shaft, and made known their discovery.

At once preparations were made for sending down gangs of men, four in each gang, for the purpose of bringing up the dead as fast as they were found. At half past six A. M., four hours after the discovery of the bodies at the stables, a gang of men went down, and remained about half an hour. This proved the successful visit, so far as finding the bodies of the dead miners was concerned. Nearly the entire num-

ber of men were found to have fled to the east side of the plane. As this gang came up, and reported the finding of the bodies, another party went down, but were hindered in getting at the bodies by a car packed around with coal, culm, and clothing, and when this was removed another obstruction appeared.

One man was found lying upon the outside, where he had been assisting to build the wall. The wall was completed, save a small aperture sufficient to admit a person. Apparently the man had just finished his work, and was crawling back to his companions, when death overtook him. The majority of the miners were found piled one upon another.

The first body brought out caused great excitement among those whose relatives and friends were below. The countenance wore a placid look, and was not much disfigured. The left eye was partly open, and the arms and legs were slightly burned.

The next body had both eyes open, and the head turned aside. The next was that of a boy, who had gone down the mine on the morning of the fire for the first time. Then came the body of a man who had evidently suffered extreme agony, judging from his countenance. His hands were firmly clinched, and in one he tightly grasped a pick. Another body appeared to have suffered great pain. Two boys had clasped their arms about this body, and the three proved to be father and sons. Another man was found in a kneeling posture, as if his dying moments were devoted to prayer.

Some of the men in the fresh gangs lost their way on several occasions, and so a barrel of lime was sent down to make a direct path to what may be called the dead-house.

About four hundred yards from where the most of the miners were discovered, a body was found by itself. It was resting upon the face, and had apparently been thrown upon the ground. At a little distance was another body in a similar position, and this, too, had been thrown to or had fallen upon the ground.

In less than two hours over sixty bodies had been taken

out of the mine. As they were brought up the grief was intense and heart-rending. Almost to the last moment wives, children, and relatives hoped against hope; but as the bodies were one by one sent up the shaft, the hopes died away. All around the sobs and moans of mothers and wives broke at intervals into piercing shrieks and wails of agony as the bodies were recognized. Many of the men were overcome with grief as they saw the remains of their comrades, and tears trickled down their cheeks from eyes unused to tears. Children too young to know their bereavement clung in mute astonishment to the sides of their weeping mothers, and shrank from the blackened corpses in which they were unable to recognize the fathers who kissed them farewell on the morning of the fatal day.

The men who brought out the bodies described the scene in the mine as best they could through their mingled grief and horror. Fathers and sons, they said, lay clasped in each other's arms. Some of the dead were kneeling; some were sitting hand in hand, as if they had vowed to live and die together; some lay on the ground, as if they had fallen while fleeing; and others lay as if pressing their faces into the earth in the hope of extracting from it a breath of pure air. Near the embankments were the picks and shovels that had been used to lay up the works that should exclude the foul air. In one chamber every man had stripped off his clothing to use it in stopping the crevices of the embankments, and one man was in the attitude of pushing his coat into a crevice. Apparently while he was so employed the foul gas rushed in and overcame him.

Most of the dead were buried on a knoll overlooking the Wyoming Valley. The funeral was attended by many hundreds of people, and was probably one of the most impressive funerals ever seen in the United States. Public subscriptions were opened in all parts of the country, and the people everywhere responded liberally to the appeal for aid. The legislature of Pennsylvania passed a law forbidding the exploitation of mines beyond a certain depth and capacity with but one

THE AYONDALE DISASTER—REMOVING BODIES FROM THE MINE.

shaft, and a similar law was enacted in other states. Never has public attention in America been so completely drawn towards a mining accident as in this instance. Good has come out of the terrible disaster, and it is to be earnestly hoped that more good will follow.

The terrible calamity at Avondale will be long remembered, not only in Pennsylvania, but throughout the United States. Every few months an accident at some one of the coal or other mines causes the interest in Avondale to be awakened ; but happily there has been no accident at all approaching it in loss of life.

## XL.

### IRON AND IRON MINES.

IRON AND ITS VALUE. — ITS ABUNDANCE, AND WHERE IT IS FOUND. — A MOUNTAIN OF IRON. — IRON MOUNTAIN AND PILOT KNOB. — THE AUTHOR'S VISIT. — CHASED BY GUERRILLAS. — A NARROW ESCAPE. — THE ANTIQUITY OF IRON. — ITS VALUE IN MANIPULATION. — IRON AS MONEY. — INCONVENIENCE OF USING IT. — FIRST IRON WORKS IN AMERICA. — DIFFERENCE BETWEEN IRON AND OTHER MINES. — DIRECT AND REVERSE WORKINGS. — A PICTURESQUE SCENE.

OF all the metals, iron is the most useful, and is found in great abundance in many parts of the globe. England, Sweden, and Russia are the most famous countries of the old world for the production of iron, and in the new world, North America has an inexhaustible supply. Along the Atlantic coast, from the New England States to the Carolinas and Georgia, there are numerous deposits of iron. On the west side of the Alleghanies there is an abundant supply. The great centre of the iron mines of that region is at Pittsburg. As we go farther west, we find most of the states are rich in this mineral, and in Missouri there is a mountain composed almost entirely of iron. The Iron Mountain of Missouri is of itself a great curiosity.

It is situated in Washington County, and is easily reached by railway from St. Louis. Properly speaking, it is not a mountain, but a hill. Its elevation above the valleys around it is less than four hundred feet. It is a low cone, with gently-sloping sides, and covered with a forest of oak trees. The soil where these trees grow consists of peroxide of iron, some of it being pulverized, and some of it in small lumps. On the sides of the mountain there are loose lumps of ore scat-

tered about, and before the workings began there were large masses of iron on and near the summit, some of them weighing many tons. Though the character of the mountain has been known for many years, no attempt was made to work this immense mass of ore until 1845.

A cutting was made in one side of the mountain, and the ore was found to be of excellent quality. In the valleys surrounding the mountain there is an abundance of ore, and for all practical purposes the iron mines of Missouri are inexhaustible. The ore contains nearly seventy per cent. of iron, though its yield, owing to the manner of working, rarely exceeds sixty per cent. About six miles south of Iron Mountain is Pilot Knob, which covers an area of three hundred and sixty acres, and is nearly six hundred feet high. It contains great quantities of iron, but is not as rich proportionally as the mountain which bears the name of the metal.

About two thirds the way up the side of Pilot Knob, there is one bed of ore about twenty feet thick, and estimated to cover more than fifty acres. Other mountains of the same character are in the vicinity, and all that is required to make the Missouri iron mines the best in the world is the discovery of a mountain or two of coal suitable for reducing the ore and refining the metal.

Iron is applied to a greater number of purposes, and consumed in larger quantities, than all other metals combined. There is no other metal which increases so much in value by the process of manipulation as this. A bar of iron worth five dollars is worth ten dollars when made into horse-shoes, fifty-five dollars when made into needles, four thousand dollars when made into penknife blades, and two hundred and fifty thousand dollars when made into balance springs of watches. In the form of wrought iron it is soft when heated. It can be hammered into any desired shape, rolled into plates, or drawn into fine wire. Plates can be rolled no thicker than a sheet of letter paper. The wires can be drawn so small as to be almost invisible to the naked eye. Combined with a certain quantity of carbon, it can be melted and cast into any

desired shape, and with another proportion of carbon, it takes the form of steel. As before stated, it enters in a thousand ways into our daily life, and if all the iron in the world were destroyed, mankind would suffer greatly.

The antiquity of iron is not exactly known, but it is supposed that the metal has been in use more than four thousand years. The catacombs of Thebes and the tombs around Memphis, some of them more than four thousand years old, represent butchers sharpening their knives on round bars of metal, and the color of the knife and metal indicates that they were of iron or steel. Homer has alluded to iron in the poems which have descended from him to us. History tells us that the Spartans were required to use this metal as money; probably it was more valuable at that day than now. If our money were made of iron it would be rather a serious matter for a man to carry cash enough about him to make himself comfortable for twenty-four hours. Imagine a New Yorker, starting on a journey where there were no banks, and he were required to carry a thousand dollars or so in coin. He would need a pair of horses to transport enough for buying his railway ticket to Washington, and for handling the loose change required on the road, he would need the assistance of half a dozen porters.

During the first seven centuries of the Christian era, the manufacture of iron attracted little attention. In the early part of the eighth century, mines were opened in the south of Europe, and from there, in the ninth and tenth centuries, the manufacture of iron spread northward. Improvements in the process of manufacture were steady, but slow. Small furnaces were made by which cast iron was produced, and after them came the invention of the blast furnace, which is said to have occurred about the middle of the sixteenth century. Other improvements were made in the following centuries, and in the eighteenth century a blast was forced into the furnace by means of a steam engine. Up to 1827 the blast was cold; but in that year a Scotch inventor patented a system by which hot air was thrown into the furnace, instead of cold.

The invention was regarded of so much importance that the patentee obtained damages of nearly a million of dollars from a single company that had infringed upon his rights.

Iron mining in America belongs almost entirely to the present century. The existence of the ore was known before that time, but very little use was made of it. A History of Virginia says that the settlers of that colony started an iron work on the banks of the James River in the year 1622, but before anything was done, the people were killed by the Indians, and the works were abandoned for more than a hundred years. A few forges and furnaces were set up in various parts of New England, one of them as early as 1702.

In 1717 iron was exported from Pennsylvania to England; and a few years later an act of Parliament prevented the erection of rolling or splitting mills in the American colonies. The greatest improvement in the manufacture of iron, in America, is in the use of anthracite coal. Previous to 1820, iron was reduced by means of charcoal. About that year anthracite coal was tried, and found to be available; and as soon as it came into general use the business of iron manufacture progressed rapidly.

The working of an iron mine is very much like working a mine of any other character. There are shafts, and tunnels, and levels, just as in a coal mine. The ore must be raised, and the men lowered and raised, just as in any other mine. There are, however, more open worked mines of iron than of coal, for the reason that the veins of iron are generally found nearer the surface than the veins of the combustible mineral. In the Iron Mountain of Missouri, which has already been described, there is no necessity for shafts and levels, for the reason that the mountain is a mass of ore, and the only working necessary is to remove it in an open cutting, just as a bank of earth might be removed in making a passage for a railway.

The only visit I ever made to the Iron Mountain and Pilot Knob region was during the war, when work at the blast furnaces had been suspended. A small party of us climbed

to the summit of Pilot Knob, and it was not a great climb, after all. We found that the mine consisted entirely of open cuttings. The ore was drawn away from the cuttings by means of small cars, running upon a track. As the cuttings were partly up the side of the mountain, the loaded cars had a downward grade, so that no power was required to move them. Considered as mines with picturesque cuttings and underground scenes, they were a total failure.

We looked around among them, and found nothing which we could call sensational. While we were lamenting the absence of something interesting, a small party of guerrillas made their appearance in the valley below. They were armed, and we were not, and they were more numerous than ourselves. They moved straight in our direction, and we began to think that the place might be sensational, after all. We scattered among the oak trees, and disappeared as much as it was possible for us to disappear. The guerrillas evidently concluded that we were not worth attacking, — and they were entirely right in this conclusion, — for they changed their course, and rode away. We immediately abandoned our researches among the iron works, and returned to the railway station, which we considered a much safer place.

In many metallic mines the operations are not conducted exactly like those of coal mines, for the reason that the position of the veins and beds is frequently quite different. Some of the metal lodes are sometimes perpendicular, and generally have a high inclination to the horizon. In such cases, the system of working is by means of steps. Sometimes these steps are *direct*, or descending, and are made by attacking the ore from above. In other cases the steps are *reverse*, or ascending, and the ore is attacked from below. In either case the excavations are like steps of stairs. The direct system is not in use in coal mines, because the miner would be obliged to stand upon the coal which he had disengaged; but it is frequently adopted in obtaining metallic ores, which have to be pulverized and dressed to make them fit for the furnace.

Where the metallic ores are in very rich lodes, or thick

INTERIOR OF AN IRON MINE.

masses, they are worked by a system of large chambers, or extensive excavations. In this system great chambers are hollowed under the earth and around the masses of valuable ore. In the copper mine of Lake Superior, and in some of the Nevada mines, this system is frequently employed, and sometimes the uncovering of a large mass will require considerable time.

The methods and apparatus used in the underground beds and levels of coal are equally applicable to iron and all other ores. The railway wagons and horses are the same in the levels and galleries of all kinds of mines. The workings are conducted upon the same principle; the ventilation is afforded by the same means, and the surveys are accomplished in one case the same as in the other. The arrangements of the shafts are very much the same, and the buildings at the surface have a family likeness. There is, however, more animation usually about coal than about metal mines, for the reason that very few metal mines furnish in the course of a month as much weight of material as some coal mines do in a single day.

In metallic mines the work is generally harder than in coal mines, and a great deal of blasting work is required. The drills, hammers, and other tools used are like those used elsewhere, and sometimes the groups at work are very picturesque. Imagine three men stripped to the waist, one of them holding a drill and the others striking at alternate and regular intervals with large hammers. A single lamp burns near them, and makes a curious effect of light and shade. The perspiring skins of the men glisten beneath the rays, and as they swing their arms back and forth to wield the heavy hammers, they have an appearance not altogether human. A novice in mining, when taken to the locality where these men are at work, might easily be persuaded that he was looking at a group of gnomes and wizards engaged in some diabolical business.

In the production of iron it is generally found less expensive to transport the ore to the coal than to transport the coal to the ore. Most of the ores are carried to points where coal

can be obtained at a cheap rate ; and where coal mines and iron mines are found close together, the production of iron will be most profitable. For example, the ores that are obtained in Oneida County, New York, are transported to the anthracite regions of Pennsylvania, to be smelted in the great furnaces at Scranton, and the canal boats that carry the ore bring back coal for the furnaces near the mines. The reduction of iron ore is much more difficult, in most cases, than the work of obtaining the material from the earth. Sometimes the ore is of such a peculiar character that it will only yield to the hottest fires, and frequently the furnaces are run at considerable loss.

### EXILES IN SIBERIA.

TOILING IN A SIBERIAN MINE. — A DARING ESCAPE. — HOW IT WAS PLANNED. —  
TUNNELLING TO LIBERTY. — DISARMING GUARDS. — WORKING IN THE DARK  
AND WITHOUT FRESH AIR. — A MURDEROUS ATTEMPT. — CUSTOMS OF THE  
SIBERIAN PEASANTRY. — CARE FOR THE EXILE. — A SURPRISE. — A NARROW  
ESCAPE FROM DEATH. — LIVING IN A MOUNTAIN GLEN. — HUNTING IN THE  
ALTAI MOUNTAINS. — KILLED BY AN ARGAL. — SEPARATION AND DEPARTURE.  
— HOW TO OBTAIN PASSPORTS. — SAFE ARRIVAL AT HOME.

ONE of the mining regions of Siberia is in the valley of the Yenesei River, and along some of its upper tributaries. The Birusa River is one of these tributaries, and many an exile has been sent there in times past, to work out the sentence allotted him. Most of the mines are known as surface washings, like the gulch mines of California, but some of the more extensive are conducted on the tunnelling principle. Tunnels are driven into the hill-sides where it is thought gold can be found, and the earth is then brought out and washed in the river. In one of these mines some years ago, there was a daring and successful attempt to escape, which was described as below by one of the participants.

“Occasionally the earth in the tunnels used to fall, in consequence of not being properly secured; but the quantity was rarely very large, and the result was not serious except in two or three instances. We were driving a tunnel in one of the small hills on the banks of the Birusa, and, as the soil was of a loose character, the falls of earth were quite frequent. The men worked in gangs of ten or twelve, under the charge of an armed overseer; and as each man was in chains, and the mouth of the tunnel was carefully guarded, there was no expectation of an attempt at revolt. There were some crimi-

nals among us, but the most of the laborers were unfortunate Poles, who had been sent to Siberia because they wanted their own country to be free, and had endeavored to secure her freedom. I was among the latter, and had been more than a year in the mines when the incident I am about to relate occurred. Not a day had passed, during my imprisonment, when I was not meditating some plan of escape.

"At last I hit upon something which I considered feasible, and mentioned it to one of my companions. He agreed to it, and we gradually broached it to the rest of the men in our gang. Some of them hesitated at first, but they soon entered into it, and we made our arrangements.

"The hill was small, and I had discovered a sort of ravine or valley running along and into one side. I understood surveying pretty well, and calculated that the tunnel at one point was not more than twenty feet from this ravine. The prison where we were kept when not working was some distance from the hill, and the guards were so placed, that if we could get from the tunnel into this ravine, we could escape. My plan was to have a fall of earth in the tunnel near the entrance, and to dig a passage into the ravine while the dirt was being removed from the place where it had fallen. I took a lesson from ground squirrels and other burrowing animals, and intended to fill the tunnel with the dirt we removed, so as to keep our pursuers, or rather our rescuers, busy as long as possible. We managed to secrete an extra lot of candles, and also to conceal two days' supply of provisions. We then communicated our plans to the gang that relieved us at sunset, and they agreed to join us.

"On the evening fixed for our attempt, the relief gang was marched into the tunnel, and we were ordered to quit work. At a given signal we seized and disarmed our guards, and then bound them securely, putting gags in their mouths to prevent their giving any alarm. I then went to the place I had selected for the fall of earth, and pulled away the wooden supports. Down came the earth in such quantity as to block up the entrance, and cut us off completely from the outer

world. There we were enclosed in the tunnel, with many tons of gravel to be taken away before we could get out.

"We knew that we should soon be missed; in fact, it was more than probable that the guards at the mouth of the tunnel would hear the noise of the fall, and give the alarm at once. Of course it would be believed that the occurrence was purely accidental, and that we would set at work at our end of the heap to make our way out. I had carefully noted the spot where I intended to begin *my* tunnel, which should lead us to the open air, and to freedom.

"Part of the men began digging at the place I indicated; others carried the dirt, which was taken out, to the heap which formed our barricade. Two or three men were kept at the barricade making a great noise with pounding on the fallen timbers and pretending to shovel away the dirt. Our object in doing this was twofold; first, to drown the noise of our work on our new tunnel, and, secondly, to make it appear that we were as anxious to get out, and were as diligent in our efforts, as were those outside to help us. My calculations were, that we could get outside in about eight hours, as the earth was not very hard, and we were only making a narrow tunnel through which we could just pass by stooping.

"The men worked with a will, for life and liberty were at stake. We relieved each other every half hour, and never did men do more active service. The perspiration rolled from us in streams, for the air was hot and close, and I had not calculated in how short a time the confined atmosphere of our cavern would become foul with our breath, and with the heat of the candles. We extinguished all our lights except those where the men were employed, and those who could do nothing towards our enterprise sat in the gloom and were silent for the most part. We talked in low tones, through fear of being overheard by those who had been our guards, of our movements after we should escape from our confinement. Gradually the men ceased to speak, and some of them dropped their heads forward in sleep. As I had planned the escape, I was looked upon as the leader. I had

too much responsibility upon me to allow me to sleep. I felt drowsy, however, and seemed to be falling into a sort of stupor, like my comrades. I knew that my feelings and theirs were caused by the heavy atmosphere, and longed most anxiously to reach the open air.

"Eight hours had passed, and there were no signs of an end to our labors. The candles were burning dim, and threatened to go out speedily for want of oxygen to sustain them.

"Two of our number were criminals, and not, like the rest of us, political prisoners. One of the criminals proposed to kill our guards, so that they could give no information about us; but we refused to consider his proposition. He was a bloodthirsty wretch, who had been exiled for attempting to kill a companion while in a dispute over a glass of vodka. But he seemed so determined to murder the guards, that we concluded he might prove treacherous to us, and so we watched him closely. He tried by stealth to kill one of them, and I then thought he deserved no more forbearance from us. We bound him hand and foot, determining to take him with us a day or two, so that he could not give information about us, and then leave him to take care of himself.

"Just as the candles were flickering, and we were almost suffocated with the foul air, one of the men at work in the tunnel rushed from his place, and said, half shouting, and at the same time half whispering, —

"‘We’re through! We’re through!’

"I went forward, and sure enough, there was a small aperture through which the dawning day was just visible. In a few moments the aperture was enlarged so that a man's body could pass to the outer air. The cool, clear atmosphere was refreshing in the extreme, and the shock of the change was so great that I almost fainted as I began to breathe freely. Day was breaking, and no time was to be lost. We could hear the men at work removing the fallen debris, and it was evident that they had not yet discovered our plans, or suspected that we were trying to escape. We had few prepara-

tions to make, and in five minutes after the opening had been sufficiently enlarged, we crept through it, and were out of our temporary tomb.

"We crouched close to the earth, as a part of the ravine was visible from the prison, and there were fears that some of the guards might discover us. We left our chains where we had thrown them off, in the tunnel, and fresh strength seemed to be added to our limbs, as we moved without restraint, and inhaled no longer the hot air of our place of labor. The murderer endangered us by rising to his feet, and standing at full length in an exposed part of our pathway. I was just behind him, and carried one of the guns wrested from our guards. I gave the scoundrel a punch with the bayonet, and quickly brought him to the ground. I threatened to kill him on the spot, but he promised good behavior in the future, and I allowed him to live.

"From the ravine we managed to get into a small forest, without, as we thought, being seen by any one. In the forest we could walk erect, but we had great fears of meeting some one of the soldiers who belonged to the station, and might be astir to select wood for cutting. We pushed along, and luckily encountered no one; and by the time the sun was up, we were more than a mile from the place where we had dug our way to freedom. We walked in silence, stopping now and then to look around in all directions. We had nearly as much fear of meeting any one as we had of being pursued, since an encounter with a soldier or Cossack would give the alarm of our flight, and pursuit would then be a question of only a few hours at farthest.

"Two miles or more from the station, we reached the house of a peasant, or rather the edge of the clearing where he was settled. We dared not approach the house; but we knew that we should find means to save the provisions we carried, as there was pretty sure to be a turnip-patch in its vicinity, where we could help ourselves. The Siberian peasants show great kindness to escaping exiles. They never speak of them as exiles or prisoners, but as '*chasti ludi*,' or 'unfortunates.'

Frequently they put loaves of bread outside their windows, in such position that they cannot be stolen by dogs, though easily taken by men. A hungry fugitive can thus help himself without fear of detection; and when the peasant rises in the morning, and finds the bread gone, he crosses himself devoutly, and breathes a prayer for the successful journey of the fugitive. 'God will help him,' he says, 'and speed him on to safety.' Frequently they plant patches of turnips at a little distance from their houses; and these turnip-patches are specially consecrated to feeding the unfortunates. And if no special field is set apart for his use, the exile knows that he can help himself to whatever vegetables will satisfy his hunger, and the owner will make no complaint.

"We found a small garden, where turnips and other vegetables were growing, and we did not hesitate to take what we wanted. A man came from the house, and I think he saw what was going on; but he pretended the most perfect indifference, and walked back again. Only two of us entered the garden; the rest remained in the edge of the forest, and waited for the two to gather what was needed for all. After taking a couple of turnips for each man, we moved away, and travelled in a westerly direction a little distance from the valley of the river. And now we began to debate about the best plan for our future action. How should we travel? Should we separate? And, if so, into how many parties? And what direction should we take? These were the questions that troubled us.

"The Siberians have a proverb, 'He who runs away has but one road; he who pursues has ten.' Several hours must elapse before our flight would be discovered, and when it was known, it would take some time to find where we had gone. But we were three thousand miles from Poland, and all except the two Russian criminals spoke Russian so poorly that we could not disguise ourselves effectually. All along this road there were military posts and soldiers, and in the towns we should be likely to pass there were the local police. Our number was so large that it would excite suspicion at the very

first station we passed; and the probabilities were, that if we kept together, and attempted to travel on the great road, we should all be retaken within three days. Plainly, this was not our proper course.

"We held a consultation, and each man was told to advance his views.

"One plan which was offered was, that we should keep together, and push southward into the Altai Mountains, trusting to subsist on fish caught from the streams, and on whatever game we could kill with our guns. The mountains are quite unsettled, and game is abundant; so that the plan was a good one, so far as existence went, provided we could make our ammunition hold out. But we had only ten charges for each gun, and these would soon be exhausted. We might set traps, and catch game in them; but this would involve delay, and render our progress very slow. South of the Altai Mountains we should be out of Russian territory, and among the wild Kirghese and Tartar tribes. Among these we could travel westward till we reached the Caspian Sea. Crossing that body of water, we should be in Circassia, and might have reasonable hopes, if we reached it in safety, of ultimately seeing our homes. But the way was long and dangerous; the Tartars are treacherous, and might convert us into slaves, or sell us back into Russian hands. After a brief debate it was decided not to adopt this course.

"Another plan was to break into parties of two or four, and attempt to travel by night, while lying concealed during the day. We had almost resolved upon this, when I thought of a feasible scheme, which I proposed. It met a ready concurrence, and was at once adopted.

"'All roads will be watched,' I said; 'and if we break into parties, and move on at once, some of us will be caught. Let us move south into the mountains, and find a place where we can pass the winter. We can trap game enough for our winter support, and can make a tolerable shelter by piling up stones, and roofing them over with trees. We will keep together till spring, and can find a secluded place where we

shall not be liable to be discovered. We have no passports, and cannot travel without them; and my scheme includes an arrangement for getting them. In the spring we will leave our hiding-place, and break up into parties of three. Our beards will have grown out by that time, so that we shall not be recognized as prisoners, and our hair will be long enough to cut in the Russian style. Then we can go to the private mines, and hire out as laborers during the summer, and by the end of summer we shall be able to travel without much fear of detection. We can pretend to having lost our passports, and the certificate of our discharge from the mine where we were employed will be sufficient for us until we get out of the province. After that we can get along somehow; at all events we can stay a couple of years in the mines, and then obtain papers that will carry us in comparative safety where we want to go. It may take us two or three years to reach Poland, but we shall certainly be better off than by running the risk of recapture.'

"When our plan was settled, we all knelt and prayed for success. We observed the direction of the sun, and travelled towards the south, keeping well away from the river valley, where we could see the only settlements which the region contains. We made good speed that day, and halted at night in a little glen surrounded by high rocks, and affording an excellent place for concealment. From a small stream near by we caught a few fish, and as each man had carefully preserved the provisions brought from the station, and eaten nothing but the two turnips obtained in the morning, we had no immediate fear of starvation.

"Early in the morning we continued our journey. No incident of importance occurred during the day, and at night we halted in a place much like the one where we had last slept.

"On the third day we saw mountains in the distance, and knew that they were some of the peaks of the outlying chain of the Altai range; but they were a long distance away, and seemed to recede as we approached them. We pressed for-

ward as fast as possible, though some of us were in danger of falling through exhaustion. Our feet were sore, as we had long been unused to travel, and on the fourth night we concluded to rest a day or two to gather strength. We dared not light a fire through fear of discovery, and so we passed the cool hours between sunset and sunrise closely huddled together, and shivering till our teeth chattered with pain. We made rude beds of boughs, and slept on them as best we could; but our sufferings were so severe that we shuddered at thought of the winter that was coming, and more than once several of us wished we were back again in prison. The day of our halt was passed in sleep, two of our number being kept at watch, to warn us of the approach of any one who might discover us.

"Towards evening a man was seen approaching our retreat. The murderer convict, whom I will call Egar, was on the watch at the time, and with him was one of my compatriots. A low whistle from Egar warned us, and we all sprang to our feet. I hoped the man would pass without seeing us, and consequently we would not have occasion to harm him; but fate willed it otherwise. He came directly towards our retreat: had he stopped, and turned back, when within twenty feet, he might have escaped, as we stood among the rocks in such a way that only a near view would reveal us. As he passed the spot where Egar was crouching behind a rock, the latter sprang forward and seized the stranger by the throat. There was a struggle, in which both fell, and we rushed to the assistance of our companion. Egar seized a stone, and was about crushing the head of his antagonist, when the other watchman seized his arm.

" 'Let me kill him; let me kill him,' screamed Egar.

"The other held him, and in a moment all of us were at his side.

" 'No blood; no blood,' was our united demand; 'or, at least,' said I, 'let us do no murder. If the man must die for having found us, let us give him a little time for preparation.'

"We released the stranger from the hands of Egar, and

assisted him to his feet. He was half stunned, and I saw that he was greatly frightened, as indeed he had reason to be.

" 'I give myself up,' he said, as soon as he could speak.

" 'Where are you from?' I asked.

" 'From the Petrovsky mine,' he replied.

" 'When did you leave it?'

" 'Three weeks ago.'

" 'Where have you been during that time?'

" 'Hiding in the forest, and among the rocks; but take me back, and I will not resist.'

" 'Well, come along,' I said, in a tone of authority; and we led him to the place we had just left.

" Two of us held the muskets over our prisoner, while I questioned him closely, and found that he was, like ourselves, escaping from captivity. When fully satisfied of the truth of his story, I nodded to my companions, and told him our true character.

" He opened his eyes in astonishment, and then fell on his knees, to thank Heaven that he was yet free. Of course he was added to our party, though Egar urged that it was the safest plan to put him to death, and thus prevent the possibility of his escaping and giving information of our movements.

" But all the rest were opposed to such a bloody deed, as we shrunk from killing a fellow-being, and besides, were satisfied that the man told the truth.

" In the morning we changed our position to a more secluded spot, as we naturally thought there was danger that others might wander in the same direction as the new comer. We rested the entire day, and were sufficiently recovered to push on. Just as we were about starting, our lookout saw, in the early light, a couple of horsemen riding up the valley. They were followed by two other horsemen at a short distance, and we naturally concluded that they were pursuing us. So we remained concealed, and, four or five hours later, we saw the men returning, as if they had abandoned the search. I say, we saw them, but, in fact, only one of our number did so, as the rest lay concealed among the rocks. As soon as they

were out of sight, we moved forward, and made a good day's progress, notwithstanding the loss of the morning hours.

"We were in a wild country, where settlements were few, and none of them extended beyond the valley of the river. We dared not approach any of these for fear of giving indications of our whereabouts; we could trust the peasants in most instances, but of course there might be, now and then, one who would betray us. Some of the settlers in this region are Cossacks, and these have not usually any sympathy with the exiles, but would capture or kill them with little compunction. 'Shoot a rabbit, and you get his skin,' says a Cossack proverb; 'but shoot a *varnak* (vagabond), and you get skin, pelisse, and overcoat.'

"We lived upon fish from the small streams, upon edible roots which we found occasionally, and upon the remnants of our provisions brought from the mine. We resorted, in a few instances, to theft, at the suggestion of Egar and the man he had captured. A strange sort of friendship sprang up between them, and they went together on several enterprises for our common support. At night they would descend to a farm, whenever one was within reach, and would generally manage to bring away a lamb or pig, which would be immediately killed and cooked. We made fires at night only, and always in such a way that the light was not visible for any distance; but this mode of supply was precarious, and whenever we obtained anything by it we were careful to preserve our provisions as long as possible.

"Among the outlying hills of the Altai we left the settlements altogether, and depended entirely upon our own resources. Now and then there were villages or encampments of the Tartar inhabitants of the region, but we avoided them altogether, though occasionally stealing a sheep from them. These Tartars have large flocks of sheep, and are not very watchful of them; so that a theft was comparatively easy, with the exception of the danger of discovery by the dogs, which are always kept around an encampment. Several times Egar returned empty-handed from his expedition, and severely

anathematized the dogs for interfering with what he considered a legitimate pursuit.

"With many hardships, but with no adventures of importance, we reached a sheltered place in the mountains, where we thought we would be safe from pursuit, and established ourselves for the winter. We found a glen containing a grove of larches and firs, and on three sides the rocks were precipitous and overhanging. The entrance was narrow, and could be easily defended, and in one place there was an opening in the rocks which we could easily roof over to form a house. The glen was full of hares and other small animals; Eggar and his new friend were skilful in constructing traps, and we at once set at work to lay in a supply of food. Eggar, in one of his expeditions in search of sheep, had stolen an axe, which proved of great service to us in many ways. We made a comfortable shelter, where we could live; our beds were of boughs cut from the trees, and we soon gathered a sufficient quantity of skins from the animals we caught to make a good supply of coverlets and winter clothing. We desired to save our ordinary clothing for future use. The suits we wore in prison were the common garments of the peasantry, and the only mark to indicate our character was a number sewed upon the right shoulder. This we had carefully removed, so that we could readily pass for peasants.

"The winter came on, and proved of unusual mildness. The snows were light, and we were well sheltered, so that we did not suffer. We trapped game, and hunted occasionally among the hills, but were very careful of our ammunition, so that we relied almost entirely upon our traps. On several occasions we ran down the *argal*, or mountain sheep, and frightened them into attempting to jump a ravine too wide for their strength. They fell upon the rocks, and were killed by the force of the fall. But we found this mode of hunting very dangerous, and once it resulted fatally. Serge Ponitsky, one of my countrymen, was pursuing an *argal* over the rocks, and half a dozen others of our party were shouting to the animal in order that he might keep in the desired direction. Serge

was close upon the argal, and in his excitement did not observe that he was near the edge of a high cliff. Suddenly the brute stopped, and wheeled around. Serge waved his cap to make him continue in the way he ought to go, but he had made up his mind not to keep on. Serge then seized him by the horns, — not thinking of the great strength of the animal, — and the two struggled for a few moments; in their struggles they went near the edge of the precipice, and suddenly rolled over it.

“ We scrambled to the foot of the cliff as soon as possible, our hearts full of fear for the result. We found the argal dead, and Serge lying upon him. Both his legs were broken, several of his ribs were crushed, and as I bent over and took his hand, I heard him faintly pronounce the words ‘home’ and ‘Poland.’ He then became unconscious, and five minutes later he was dead.

“ We buried him near our camping-place, covering the grave with heavy stones, and erecting a cross above it. The event cast a gloom over our party, and for several days no one cared to venture into the mountains. After this accident we were more cautious, and nothing of a serious nature occurred during the rest of the winter.

“ In the spring we divided into twos and threes, as previously arranged, and left our camp. We drew lots to settle the order of departure, as it was arranged that the divisions should start at least two days apart, so that there would be little risk of their encountering each other, and attracting attention by their numbers. Our parting was tearful, as we had been endeared to each other by our mutual experience of peril, and it was certain that we should never again be united. My lot fell to the third division, and though I live a thousand years I shall never forget the morning when I embraced those I was leaving behind me, and set out to encounter dangers that I could not foresee. Silently with my two companions I left the camp, and for more than two hours neither of us could utter a word.

“ We travelled on and on to the settlements on the Yenesei,

subsisting as we had subsisted at the time of our escape. At one of the private mines we obtained work during the summer; laborers were scarce, and the proprietors were quite willing to engage us without asking any questions that might annoy us.

"At the end of the summer we were paid off. A few days before our payment we managed to drop some worthless papers into a fire where several men, among them one of the superintendents, could see us. We pretended to be in great distress, that the papers were our passports, and that we had nothing else for our protection. The chief of the mine consequently made certificates to the loss of our papers by accident, and the certificates were sufficient for our protection. During the winter and early spring, we managed to travel to the Ural Mountains, where we again hired out for the summer. In this way we obtained money enough to take us to Poland, where we arrived three years after the date of our escape.

"What became of the rest of our party I have never positively known. Two of them have reached Poland, as I am informed; and I have heard vague rumors that some of the others were captured, and returned to the servitude from which they had escaped. But no direct tidings from any of them have ever reached me."

## XLII.

### LEAD MINES OF IOWA.

BLUFFS AT DUBUQUE, IOWA. — THE LEAD MINES. — HOW LEAD IS FOUND THERE. — INDIAN DISCOVERIES. — HOW THE SECRET BECAME KNOWN. — STORY OF THE SIX INDIANS. — FOLLOWING THEIR TRACKS. — AN INDIAN TRAITOR. — AN EXPLORER'S ADVENTURE. — THE INDIAN GUIDE AND THE GREAT SPIRIT. — MURDER OF TWO EXPLORERS. — USES OF ABANDONED SHAFTS AND CAVES. — AN EDITOR'S DISCOVERY. — AN UNDERGROUND BANQUET. — UPS AND DOWNS OF A LEAD MINER. — DEATH OR A FORTUNE. — A DANGEROUS BLOW. — A MINUTE OF GREAT PERIL.

ON the Upper Mississippi, in the vicinity of Dubuque, Iowa, there are many lead mines, and in the vicinity of these mines the bluffs contain numerous caverns, rarely of great extent. Sometimes these caverns are in the form of a succession of chambers extending and opening into one another; and in these chambers rich deposits of ore are found. Several years ago the author visited Dubuque and the region around it, and was kindly escorted by one of the citizens, Mr. Henry W. Pettit, in an examination of the natural and artificial curiosities of the place. We had a wearying tramp, and returned to the hotel covered with dust, accumulated in our inspection of shafts, tunnels, caves, and other underground works of nature or art. I was under the impression that if we had been reduced in a furnace, a fair amount of lead could have been obtained by the reducer; and lest some enterprising resident should make an effort in that direction, we washed off the accumulation as speedily as possible.

The lead mines of Dubuque were discovered and opened soon after the settlement of the place by Julien Dubuque, after whom the city was named. The Indians were aware of the existence of the rich mineral, and the first information about it was obtained from one of the red-skinned gentlemen

(613)

who had partaken rather freely of the white man's fire-water. They used to bring lead to sell to the whites; they revealed some of the localities whence they obtained it, and then their white neighbors went to work to dig for themselves. But there was one deposit, supposed to be the richest of all, that the Indians would never reveal, if the story was told to me correctly. There were half a dozen Indians who used to appear and disappear mysteriously; whenever they wanted money or goods, they would go away a few days, and return with all the lead they could carry. All efforts to induce them to tell where they obtained it were of no avail. The experiment was tried repeatedly of getting them drunk, but the more they got drunk, the more uncommunicative they became. They were promised that if they would show the rich deposit, they should never again be required to draw a sober breath as long as they lived; but even this glittering bait did not allure. Wealth, fame, and perpetual intoxication could have been theirs, but they preferred to bask in the sunshine of the smiles of the Great Spirit, who would be unpardonably angry if they told their secret to the white man.

A watch was set upon their movements; but an Indian is proverbially a troublesome customer to the detective who tries to follow him, and the spies on the track of these aborigines invariably came to grief. Finally, one of the pale-faces pressed his arguments so far as to induce an Indian to agree to turn traitor to his brethren, and reveal the locality of the lead mine. Comfortably soaked with whiskey, the twain started, with provisions for several days' journey. The Indian led the way to a secluded spot among the hills, miles away from any human habitation. All around in this little valley there were the remains of fires where the Indians had melted out the lead from the ore; it was so rich that a common wood fire in the open air was quite sufficient for its reduction.

But suddenly the Indian stopped, and looked anxiously into the sky. After gazing there a full minute, he turned to his companion, and refused to show him further.

"Go on, go on!" said the impatient explorer.

"No; not go on," replied the Indian. "Great Spirit angry; I see him looking now."

The explorer looked, but could see no spirit beyond that which he carried in his bottle. He offered some of it to the Indian, in the hope of overcoming his terror.

But it was "no go" with the red man. He took the proffered drink, and then looked again into the sky. Evidently he saw, or fancied he saw, the Great Spirit frowning upon him, for he turned on his heel, and ran faster than he had ever been known to run before.

The explorer was left alone, and concluded to investigate on his own account. There were the remains of the fires where the lead had been melted, and the number of them showed that a goodly amount of smelting had been done there. The mine must be near, and of course it ought to be easily found. He looked for a path which might lead to it, and here he found that the Indians' cunning had baffled him. In no direction was there any track, and it was evident that the Indians had made it a rule never to follow the same course twice when entering or leaving the valley. They had brought the ore from somewhere, but there was no way of knowing whether that place was feet, yards, or miles away.

He spent a couple of days in a careful examination of the vicinity, but found nothing, and returned home very little wiser than he went out. He had a suspicion that he was watched from the time the Indian left him until he gave up the search, but could not say positively that such was the case. A few days after his return, the Indian made his appearance with a fresh lot of lead, for which he refused all compensation, though he did not decline to get drunk at the expense of his acquaintance. He would not talk freely, but solemnly declined to go on another expedition, and, furthermore, cautioned the white man not to undertake it.

The latter would not be advised; and, two or three weeks later, he set out with a friend, with the intention of spending a week or two in exploring the region around the Indian smelting-place.

They were absent one, two, three weeks, and finally their friends became alarmed for their safety, and started out to look for them. Their search was unrewarded, as no trace of the missing men could be found anywhere. No Indians were seen. The half-dozen came and went as usual, but to all questions they returned the most unsatisfactory and non-committal answers.

One day a hunter found the remains of the two men. Wild beasts had devoured the bodies, but their weapons and scraps of clothing remained, and sufficed for their identification. In each skull there was a deep indentation, caused, undoubtedly, by a tomahawk in the hands of an Indian. But further than this the circumstances of their deaths were never known. After the discovery of the bodies, the Indians did not visit the settlement as often as before, and it was universally supposed that they committed the murder, or, at all events, knew to whom it should have been attributed.

Years afterwards a rich vein of lead ore was found two or three miles from the valley to which the Indian led the first explorer. There was a small cave, so carefully concealed by brushwood that it was only revealed by accident. There were indications that it had been visited by Indians, and that quantities of the ore had been carried away. All around the sides and roof of the cavern there were blocks of rich ore, and the discoverers made a comfortable fortune out of the deposit. It was supposed to be the cave whence the Indians obtained their supply, but whether so or not was never positively known.

In the bluff at Dubuque, lead mining was carried on in two ways — first, by entering the caverns and veins from the foot of the bluff; and, secondly, by sinking shafts from the surface. The shafts were not very deep, so that no elaborate machinery was required for hoisting purposes, a common windlass or a whim, worked by horse power, being all that was required. Where the mining was pushed from the foot of the bluff, levels were driven in until a cavern or seam was reached, and very often the seams in the bluff were taken as the starting-point.

The lead was not found in continuous veins, like coal and iron, but in separate masses, that had little connection with each other, though frequently the chambers or caves communicated. Consequently a mine might be soon exhausted, and then the shaft or level would be abandoned, as it was no longer lucrative. The hills back of Dubuque, at the time of my visit, were full of abandoned shafts, and it was dangerous to walk there at night, as many of the shafts were entirely unprotected by fences or railings. Several accidents have occurred by persons falling into these shafts; and I was told that on one occasion two lovers, who were taking an afternoon promenade there, walked into a shaft, and were killed by the fall.

While the business of Dubuque was in the height of its prosperity, about 1857, some enterprising men constructed a shot tower on the low ground near the Mississippi River. It is well known that shot for ordinary hunting purposes is made by pouring melted lead through a sieve, where it can have a fall of a hundred feet or more. In falling it assumes a spherical shape, and at the same time is cooled and hardened. To save it from injury it is received in a tank of water. Afterwards it is polished and brightened by being rolled in plum-bago and certain other substances, and is then ready for the bags in which it is offered for sale in the sporting stores.

Now, the shot tower costs considerable money, and in order to be profitable, the work of making shot must pay the interest of the cost of the tower, besides the wages of everybody concerned. The editor of a newspaper at Dubuque was one day rambling among the abandoned shafts back of the town, and endeavoring to hit upon some plan for making them once more useful.

Suddenly an idea occurred to him, and he hastened to lay it before a friend who was interested in the shot tower.

"Here is my idea," said the editor. "The melted lead must fall from a certain height, and you have spent fifteen thousand dollars to build a tower to give that height to the dropping lead. Now, it makes no difference where the fall is; and why could you not get it in one of these abandoned shafts,

which would cost nothing? And besides, you save the expense of hoisting the lead to the top of the tower. I can start a shot company that will undersell you in spite of all you could do."

The tower man stood a full minute in a brown study. When he had collected his thoughts, he said, —

"I think you are right, and wonder nobody ever thought of it before. But don't say a word about it for the present. The St. Louis Shot Company is now negotiating for our tower; it wants to have a monopoly of all the shot business on the river, and we shall sell out. When we have sold out, and have the money in our hands, you can start your theory, and anybody that wants to try it can do so. If you say anything now, you may spoil the whole arrangement."

The editor promised to wait, and kept his promise. The Dubuque tower was bought by the St. Louis Company, which congratulated itself on having a monopoly of the shot business at Dubuque. But very soon the editor advanced his theory; somebody put it in practice, and found it was entirely correct. Abandoned shafts were occupied by shot-makers, and found to answer the purpose exactly, and the business of the tower came to an end. "Why did not somebody think of this before?" is a question that is often asked whenever a new and simple invention is brought to the attention of the public.

When the mines were operated at the base of the cliff by means of levels, and the chambers were stripped of their lead ore, the owners found themselves in possession of magnificent cellars, that could be used for storage purposes. As time rolled on, and Dubuque grew into importance, many Germans went there to live. The German is fond of beer, and wherever you find Germans in goodly numbers, there you will find the care-dispelling lager and the appetizing pretzel. Breweries rose and flourished at Dubuque, and the fame of the beer that flowed from them extended even to the mouth of the Mississippi. The abandoned caves of the lead workers were well suited to the wants of the brewers, as they made excellent cellars for storing the beer between the time of its manufac-

ture and of its sale. They were of an even temperature throughout the year, and the temperature was exactly suited to the Teutonic beverage.

On several occasions the brewers gave entertainments in their cellars, and set the tables for their guests between the rows of beer casks. The guests were converted into casks of beer by the time the entertainments ended, and occasionally they needed assistance to find their way out to the open air. There is a novelty about an underground banquet, especially when you find your legs giving way beneath your weight, and you are led to believe that the earth above will come down at an inopportune moment, and crush you as flat as a sheet of paper, without giving you time to send word to your friends.

In our rambles about the bluffs, Mr. Pettit told me of an adventurous inhabitant of Dubuque who used to alternate regularly between wealth and poverty every few months. He was a lead miner, who spent most of his time in discovering fresh deposits of the valuable ore. When he found a deposit, he was rich, and lived at a rapid rate until the money obtained from it was gone. Then, without a dollar to call his own, and frequently burdened with debts he could not pay, he would shoulder his pick and start on a tour among the hills, where he hoped to find the material with which his fortune could be restored. Sometimes he would hunt for weeks without finding anything; and just as he had determined to abandon the search, and hire out as a laborer, he would find what he wanted. One of his adventures was narrated to me in his own words, which I will give as nearly as I can remember them.

"Once I was dead broke," said he, "and owed a good deal of money. My creditors were pressing, but they knew I hadn't the first cent to pay with, and so they didn't press very hard. I hunted around a long time, but not a bit of ore could I find, and I seriously thought of going to the river and making cat-fish bait of myself, so as to get out of my misery.

"One day I got in among the chambers in the bluffs, and in one of them I found a small hole, which I thought might possi-

bly lead to something rich. I enlarged it, and got through into a new chamber where there were blocks of lead; and then I knew there was more of it close by. These chambers often lie one above another, and there was evidently one just above where I stood. A blow or two of my pick in the ceiling above would open it, and when it was opened, there was a fortune ready for me.

"Well, no, it wasn't a sure fortune. This business has its drawbacks, and sometimes there is a serious drawback in a place like that. Most of these chambers are dry, but now and then they are full of water, and sometimes you will find a dry chamber under one that is full. There I stood, wondering what to do. I was never more puzzled in my life.

"The hole where I entered was small and long. It was a hard place to get through, and it took time. The place was low; in fact, I couldn't stand erect without butting my head. If I tapped the ceiling, and the chamber above was full of water, I should be drowned like a rat in a cage. One blow would loosen the whole bottom, and the water would come down like Niagara.

"If I went out and tried to enlarge the entrance before tapping the ceiling, some other fellow might get in there and take possession. If he opened the chamber before I did, he would be the owner, and I could not lay any claim on account of discovery.

"I thought it all over. I thought of my poverty and the fortune that lay before me. I thought of the chance of death if the cave was full of water. I threw down my pick, and almost determined to go away, and not take the risk. Then I looked at my ragged clothes, and remembered that they were all I had, and that I hadn't money enough to buy a breakfast. Then I stooped and grasped the pick, and took a firm hold of the handle.

" 'Here goes,' I said, 'for one thing or the other.' I set my teeth, swung the pick, and tapped the ceiling above me.

"The water came down; I dropped to the floor, and felt that I was lost. I must have fainted, for the next thing I re-

member, my candle, which was only half burned when I struck the blow, was nearly consumed, and I was lying there soaked in a small pool that surrounded me.

"I rose, rubbed my eyes, and looked around, and then I saw how it was. There had been a few buckets of water in the chamber above, where there might have been hogsheads. I was alive and safe, and the chamber was opened.

"I lighted another candle, and went to work enlarging the hole I had made. In a little while I was able to climb through it; and there, all around me, lay blocks of rich ore; and I felt that I was no longer the poor vagabond I had been a few hours before. But I don't think I would go through that excitement again for all the lead mines that ever were known."

## XLIII.

### THE INQUISITION.

**ITS HISTORY. — CRUELITIES IN THE NAME OF RELIGION. — SUFFERINGS OF THE EARLY CHRISTIANS. — THE EDICTS OF CONSTANTINE. — THE PURITANS AND THE QUAKERS. — HOW QUAKERS AND WITCHES WERE TREATED. — TORTURES OF THE INQUISITION. — HERETICS BURNED ALIVE. — OTHER MODES OF DEATH. — THE INGENUITY OF TORTURE. — THE RACK AND THUMB-SCREWS. — THE VIRGIN AND KNIVES. — DIMINISHING CHAMBER. — THE HOT ROOM. — FALL OF THE INQUISITION.**

AN institution of past ages which was underground in a metaphoric sense, and sometimes in a literal one, was the Inquisition. A great many stories have been told about it, some of them fictitious, while others were founded in truth. The Inquisition was originally established in Rome, and afterwards in other countries, to search out and try heretics, as well as persons charged with offences against morality, or the rules of the church. It received its formal sanction in the thirteenth century; but heresy had been pronounced a crime long before that, and inquisitors were appointed to search out and properly punish those who did not accept the true faith. It is a curious fact about religion and its growth, that where there is, or has been, persecution, the persecuted people, on gaining power, were nearly as brutal in their character as those by whom they had been maltreated. Thus the Roman emperors, when the Christian religion was founded, were not in favor of the institution, and used to condemn the Christians to be eaten up by wild beasts, to be burned on grid-irons, to be boiled in oil, to be roasted, baked, fried, stewed, or fricasseed, and served up in all the ways familiar to the cooks of those times. Beheading was likewise a fine art in the days of the Roman emperors, and the Coliseum used to have

AN ACTO-DAFFE IN SPAIN.

evening performances and *matinées*, where the entertainment consisted of the mastication of Christians by lions, tigers, and other animals, which had been imported without the slightest regard to cost.

But Christianity grew and prospered. By and by it gained the upper hand, and was formally acknowledged. Then the Christians had the power, and they went in strong for its exercise. The first emperor who made Christianity a state religion was Constantine the Great. He showed his approval of the doctrines of the meek and lowly Nazarene by banishing and treating with great severity all who did not accept the new religion and conform to its requirements. The same policy was pursued by the sons of Constantine. In the year 382 Theodosius I. appointed inquisitors for the punishment of some heretics who had long been treated as criminals deserving the severest penalties. Some of these heretics were banished, and others had their unbelieving heads removed from their unbelieving bodies, greatly to the detriment of both. Various laws were promulgated proclaiming their form of idolatry a crime. Some of the earlier fathers of the church were opposed to the punishment of heresy by death, though they generally approved sending the culprits into exile. In the year 385 a bishop of Spain ordered the leader of a band of heretics to be slaughtered with the sword, but the church reproved the bishop, and he was excommunicated.

During the first fifteen hundred years of the Christian era there was constantly more or less severe treatment of heresy, and sometimes the cruelties were practised not only upon unbelievers in the Christian faith, but upon those Christians who did not agree entirely with the church of Rome. For example, John Huss, a Bohemian religious reformer, quarrelled with the Romish church, and was declared a heretic. A council was summoned at Constance, in Switzerland, to investigate his conduct. He was tried, and his trial was decidedly a one-sided affair. According to history, he was not allowed the assistance of counsel, his private letters were opened, his

appeals to the emperor were disregarded, he was loaded with chains, placards were carried about the streets denouncing him as an excommunicated heretic, and when he finally came before the council, his attempt to answer the articles of accusation was met by such a storm of outcries and shouts that he could not be heard. He was finally condemned to be burned at the stake; and from the council chamber he was led to an open field, where a stake and a pile of wood had been already prepared. He was summoned to renounce his heresies, and die in the faith; but at the summons he only knelt and prayed, and then the fire was lighted. Huss died a martyr to his faith; and certainly the Roman emperors were never more severe towards one of the early Christians than were the later Christians towards those who did not entirely agree with them.

In later times we have had several instances of the same kind of religious illiberality. The Puritans in England were so persecuted that they fled to Holland, and thence to America, to enjoy the freedom of religion. As soon as they arrived here, and settled in a locality where religious freedom was attainable, they set about persecuting others with a severity much more relentless than that which had been shown towards themselves. Quakers were subject to their special displeasure; and they had a cheerful habit of cutting off the ears of the Quakers, burning their tongues through with hot irons, and amusing themselves in various other ways. Then they became excited on the witch question, and they used to burn and drown witches with the most perfect freedom. The Puritan divines preached against witchcraft, and a great many persons suffered death in consequence. Some of the trials to which accused persons were subjected were rather amusing, if they had not been so serious in their nature. For example, there was the ordeal of water.

A person accused of witchcraft was bound hand and foot, and thrown into the water. If he floated, it was proof positive that he was guilty, and he was condemned to death. If he sank, he was declared innocent; but before his judges

could make up their minds as to his innocence, he was invariably dead by drowning. They had a sure thing on him either way. In one year nineteen persons were hanged for witchcraft, and one was pressed to death. Among them were several reputable citizens, including one clergyman. A great many fled from the country, and there were nearly two hundred in prison, waiting trial, when a reaction took place.

The theory of witchcraft was practically abandoned, though many people retained it, and still retain it to this day. Only a few years ago, in one of the New England States I found traces of it remaining. In many rural houses in New Hampshire and Massachusetts, one will find a horse-shoe nailed over the door, and I have seen other precautions taken against witchcraft.

One day I was in a house where they had been several hours attempting to convert a quantity of cream into butter. They had churned and churned, but no butter would come. Finally the man of the house suggested that there was a witch in the churn; so he heated a horse-shoe to redness, and then suddenly lifted the cover of the churn and dropped the heated shoe inside. There was a terrible sizzling and boiling of hot cream; at least I thought it so; but it was declared by the others to be the writhing agonies of the burning witch. The churning was resumed, and in a few minutes the cream was converted into butter—a triumph for the theory of witchcraft in the idea of the man who had heated the shoe, while to my mind it was an indication that the heat had affected the cream and caused a separation of the butter from the buttermilk.

But we are getting away from the Inquisition. For several centuries all cases of heresy came before the ordinary courts; but in the course of time, the examination of the charge of heresy devolved upon the bishops, and where a heretic remained obstinate, he was handed over to the ordinary courts, to be dealt with in the manner that seemed most appropriate.

In the eleventh and twelfth centuries, the Waldenses, and

similar sects, threatened danger to the Catholic church, and led the popes to devise more serious means to exterminate heresy. At the beginning of the thirteenth century, Pope Innocent III. sent several monks to the south of France to stir up a war against one of the heretical sects, and punish them as they deserved. In 1215 a general order was issued from the Vatican, requiring the synodal courts to search out the heretics and suppress heresy; and this may be regarded as the commencement, practically, of the Inquisition.

In 1229 the synod of Toulouse issued forty-five decrees, among which were the following: "Any prince, lord, bishop, or judge, who shall spare a heretic, shall forfeit his lands, property, and office, and every house in which a heretic is found shall be destroyed. Heretics, or persons suspected of heresy, shall not be allowed the assistance of a physician or of any of their associates in crime, even though they may be suffering under a mortal disease. Sincere penitents shall be removed from the neighborhood in which they reside, if it is suspected of heresy; they shall wear a particular dress, and forfeit public privileges until they receive the papal dispensation. Protestants who have recanted through fear shall be placed in confinement."

In accordance with a decree confirmed by Pope Innocent IV., the informers were never named to the accused. Suspicion of heresy was considered a sufficient cause to arrest any one. Accomplices and criminals were admitted as witnesses. If a person accused of heresy denied the charge, he might be put to the torture to obtain his confession. This practice of torturing heretics added greatly to the development of human ingenuity. The faithful Christians used to sit up nights to devise exquisite means of torture.

One of the instruments used for torture was not invented in the interest of Christianity, though it was brought into very general use, and I believe some of the Roman emperors had the distinguished honor of its production. It was known as the rack, and consisted of a large frame, upon which the person under examination was gradually stretched until his

joints were dislocated, and his height considerably increased. The artistic use of the rack consisted in separating the joints slowly, so as to afford as much pain as possible. The crank of the machine was turned gently. A scribe was at hand, to take down the confession of the victim. If he acknowledged his guilt at an early stage of the proceedings, he was let off without much injury; but if he held out, and refused to confess — frequently for the reason that he had nothing to confess — he was kept upon the rack until death relieved him from his sufferings.

Another instrument of torture was the thumb-screw—a contrivance by which the thumbs of a person were compressed so as to give him great pain. Sometimes the two inventions — the rack and thumb-screw — were combined; but whether this combination ever received a diploma from the Patent Office I am unable to say.

Another practice of the Inquisition — but resorted to only in the last extremity — was that of breaking the limbs of a heretic upon the wheel. The victim was bound to a wheel in such a way that, when it revolved, he would be brought, at each revolution, near the executioner. This artist was armed with a stout iron bar: and, as the victim came around, a blow with the bar would break one of his limbs. First the right fore-arm would be broken, and then the left; then the right leg, below the knee, and then the left; then the upper part of the right arm, and then the left; — and so on, until the victim was broken in all his limbs, when a final blow, heavier than the rest, in the region of the heart, put him to death.

The greatest refinement of instruments of torture used in the Inquisition was exhibited in Spain. Spain was, at that time, one of the foremost nations of the globe, and she justified her claim by the perfection to which she brought the Inquisition. Some of the Spanish tortures were of an elaborate character. They had rooms so arranged that they grew smaller day by day. A person was confined in one of these apartments, and, when he entered it, he found he could stand erect, and that he had sufficient space for moving about.

Next day he would find that the roof touched his head when he stood erect, and that the walls were nearer together. Next day it was necessary to stoop to avoid hitting his head. Next day his slight stoop had become a posture of absolute bending, and he found the walls of the apartment so near each other that, by standing in the centre of the room, he could touch all sides with his outstretched arms. So it went on, day after day, giving him plenty of time for reflection and recantation; but all the while his room was growing smaller and smaller.

If he spoke to his jailers about it, they laughed at what they termed his fancies, and assured him that it must be the working of his diseased mind. They told him to recant, and he would then see clearly, and learn his mistake. Sometimes he recanted, and sometimes he remained firm in the faith. In two or three weeks his room would be so much reduced in size that he could neither stand nor lie down; in fact, he would be compressed to death.

Another mode of punishment was by shutting up the heretic in an iron chamber. He could walk around the room, and it was sufficiently high for him to stand. He was lightly clad, and, on entering the room, would find himself shivering with cold. After an hour or two, the icy temperature would pass away, and the place begin to be comfortable. In another hour it was warm, like a midsummer day. In another hour the heat was tropical. It gained slowly, but steadily, so that, five or ten hours after his entrance to the room, the floor, and walls, and ceiling would be of a blistering temperature. The air which the victim breathed would be hot and scorching to his lungs. He would fall fainting to the floor; and unless he recanted he was roasted where he fell. All this time his jailer was standing outside, telling him to recant, that the heat which he suffered was only imaginary, and caused by the diseased working of an heretical mind.

The Inquisition was established in Spain about the year 1232. At first it imposed no sentence severer than confiscation of property; but in the fifteenth century it began to

BLAZING OVENS FILLED WITH HERETICS.

IMPALEMENT OF HERETICS.

gain power, and became more absolute and independent than in any other part of Europe. The fear of a union between the Jews and the Moors gave it great power; and, to a considerable extent, the labors of the Inquisitors were directed against Jews and Moors. Queen Isabella, who fitted out the expedition of Columbus which resulted in the discovery of America, gave her consent for the establishment of the Inquisition in Castile, and thus made it more royal than ecclesiastical in its character. In 1480 an Inquisitorial Court was established at Seville. The establishment was opened for general business on the 2d of January, 1481, and several arrests were made. The business flourished so well that, four days afterwards, six persons were burned alive, and after that performance executions were very frequent.

A system of regulations was made for the guidance of the inquisitors, and the institution became very powerful. The inquisitor-general was appointed by the king, and his appointment was approved by the pope. These officials held almost despotic power, and could do very much as they pleased. One Spanish historian says that, from 1483 to 1492, the year of the discovery of America, eight hundred people were burned alive. In the subsequent seven years, 166 were burned, and in the ten years following this, 2536. The general result of his statement in regard to the workings of the Inquisition, from its establishment in 1480 to its abolition in 1808, is as follows:—

“Burned alive, 31,912; burned in effigy, 17,659; subjected to severe pains and penances, 291,450.”

About the beginning of the seventeenth century, the Inquisition had almost entirely exterminated Protestantism from Spain. There were no more heretics to be burned, and consequently the burning business died out. From that time, the Spanish Inquisition directed its efforts mainly to the suppression of heretical books. It occasionally burned somebody alive, but not often. There was a time when human cremations were as common as bull-fights, but one would now be obliged to go very far into Spain or any other Christian country to see a heretic burned alive.

Though the Inquisition was totally abolished in Spain in 1808, it was partially restored in 1814, abolished in 1820, restored in 1825, and finally, entirely, and let us hope perpetually, abolished in 1834.

In France the Inquisition was established about the same time as in Spain; but it never gained great power, as the people in the south of France rose in revolution against it in a very short time, and sometimes slaughtered the inquisitors. The parliaments were opposed to it, and several kings issued orders restricting it. In the fifteenth and sixteenth centuries, it grew steadily weaker, and was finally abolished by Henry IV., and never reintroduced.

In Italy it had a limited power, and the people frequently assassinated the inquisitors. It existed in a limited way at the time of the conquest of Italy, and Naples entirely abolished it in 1808. It was reintroduced in the Papal States in 1814, and in Tuscany and Sardinia in 1833. It still exists in the Papal States, but in a very mild form.

In other countries it has been abolished, and virtually stripped of its power. A good history of the Inquisition, describing it with accuracy in every respect, is still wanting, and it is doubtful if one will ever be written. In historical matters where politics and religion have any concern, it is always impossible to get at the exact truth. Neither side can, or at any rate does, describe things exactly as they are, or exactly as they occurred. With the Inquisition this difficulty exists. The advocates of Catholicism are inclined to cover up, or at all events to shield, its cruelties, while the opponents of the Catholic church are inclined to exaggerate its past doings. What the Inquisition really was, and what practices it indulged in, will never be known with complete accuracy.

Some of the instruments used for extorting confessions are still in existence. I have seen a helmet which was so constructed that, after being placed on the head, its size could be reduced by means of screws. There were apertures in various places, through which gimlets could be inserted for

boring holes into the head encased in the helmet. There was a small door or orifice where the mouth of the victim would be placed, and against this orifice the inquisitor would rest his ear, to hear the confession extorted. Racks and thumb-screws were shown me as relics of the days when torture was fashionable, and I have heard and read of various contrivances whose inventors deserve to have their infamous names carried down to posterity.

One of these was a statue of the Virgin Mary, and it is said that it was used in this wise: When a heretic had recanted after undergoing torture, or simply after he had voluntarily recanted, he was taken to a room where, at one end, stood a life-size statue of the Virgin. He was told that, if his recantation was sincere, he must go forward, and kiss the statue. As he went to obey the injunctions, he placed his foot in front of the image, and his weight fell upon a board which touched a spring. The arms of the statue were instantly closed about him. Knives were thrown from these arms, and he was pressed against the breast of the figure, from which other knives instantly protruded. Pierced in many places, the recanting heretic yielded up his life.

Another mode of death inflicted in the cause of Christianity was by causing the victim to descend a certain dark stairway. As he descended, not knowing whither he was going, he found the stairway suddenly giving way beneath him, and he was precipitated upon rows of spears fixed upright in a floor ten or twenty feet below the spot from which he had fallen.

I might go on giving many a page describing the tortures and horrible modes of death inflicted by the Inquisition, but those I have given are quite enough. I will briefly allude to the practice of burying heretics alive; of filling their mouths with powder, which was then lighted; of throwing them into cages, and thence into the water, where they were drowned; of tossing them into serpents' cages, and of throwing them into the sea, to be eaten up by sharks. But this chapter contains quite enough of horrors, and I will close it abruptly.

## XLIV.

### UNDERGROUND IN THE METROPOLIS.

**SUBTERRANEAN BEER SALOONS. — A "DIVE." — A "DEADFALL." — THE HABITUES. — THEIR LIVES AND HABITS. — PRETTY WAITER GIRLS. — ROBBING STRANGERS. — THE MODUS ROBBERANDI. — "SKIN GAMES." — LURING A STRANGER TO A GAMBLING DEN. — WHAT THE AUTHOR WITNESSED. — A NIGHT AMONG GAMBLERS. — ROBBERY OF A STRANGER. — DESCENT OF THE POLICE. — THE FIGHT AND ITS RESULTS. — "ROUGH GAMBLING." — A DEN OF THIEVES. — AN UNDERGROUND CELL. — HOW TWO SAILORS WERE ROBBED. — A FLOUR BARREL AS A SHIRT.**

THERE is a kind of mining life peculiar to great cities, and especially so to New York. The underground life of some portions of the great metropolis is of a very curious character. Passing along Broadway, for example, in the evening, one can see the glaring lights and gaudy signs of subterranean establishments known as beer saloons. In the slang of New York, these places have brief but descriptive names. I remember, the first time I ever saw the great metropolis, I was invited, by a chance acquaintance at my hotel, to visit, as he called it, a "dive."

"What is a dive?" I asked.

"Well," said he, "I believe you call it in California a deadfall."

A deadfall, in California parlance, is a subterranean establishment where beer is sold, and the attendants or waiters are denominated "beer-jerkers." If the deadfall supplies food as well as drink, the waiters are known by the elegant title of "hash-slingers." In New York these terms are in use to some extent, but the persons to whom they appertain generally resent the application, if it is made in their presence.

Any one who passes considerable time in New York, and is not over fastidious, is quite likely to pay a visit to the dives.

They are not entered by diving, as one would enter the sea, neither is a diving bell necessary to descend to their interior; but the visitor must pass down a flight of steps, more or less rickety, and making one or two turns before the lower floor is reached.

The habitués of the establishment are a motley class. The masculine portion are generally like the members of Falstaff's famous regiment, "the cankers of a calm age and long peace." They toil not, neither do they spin, unless the whirling of roulette balls and keno boxes can be called spinning. Solomon, in all his glory, was never arrayed like the *attachés* of a New York beer hall. If prosperous they are well but very flashily dressed. Imitation diamonds, as large as walnuts, adorn their shirt fronts, and their preponderance of brain is so great that their hats cannot be placed in a level position, but incline gracefully to one side. Early in the day they may be sober, but at night, especially late at night, they are more or less intoxicated. Their manners are not those of the best society, and their language contains a great many words and phrases which are not exactly proper to be put in print. It would be a satire upon honesty to call these men honest, and yet they would resent, in the most emphatic manner, the appellation of thieves. Their faces are not those of poets or philosophers, but they rather remind you of the physiognomy of a bull-terrier or a wharf rat. Their foreheads are generally low, and their under jaws are prominent. They are always ready to amuse themselves with a fight, and, if no strangers are present to accommodate them with a muscular discussion, they occasionally have a combat among themselves, by way of keeping in practice. During the course of every twenty-four hours they manage to get on the outside of a great deal of bad whiskey, and an advocate of the temperance cause would find among them an excellent field for his labors, though I fear that he would make very few converts to his theories, and, at all events, to his practice.

The feminine habitués of the establishment are fit companions for their masculine friends. They are generally very

flashily dressed. In some establishments they wear an Oriental costume, which has the merit of weighing very little, and facilitating the movements of the wearer about the room. From what part of the Orient these dresses were brought, I am unable to say. Some of them remind a spectator of the costume worn by the ladies in several islands of the South Pacific Ocean, where clothing is unnecessary and entirely unfashionable. I have heard visitors to these dives remark, that the ladies could pack their dresses in a snuff-box; but I am certain that the statement is not strictly true.

The nationality of these underground maidens is various. They are American, English, Irish, French, or German, by birth, and sometimes they are Italians, or Norwegians. Hans Breitman, in one of his poems, intimates that they came from Germany. He says,—

“As summer prings ter roses,  
And roses prings ter dew,  
So Deutschland gifs ter maidens  
What fetch ter peer to you.”

Hans is not correct. Deutschland does not “give ter maidens,” though it gives some of them. The greater number are of American origin, and the rest are about equally divided among the three nationalities named in connection with the American and German. But whatever their origin, their manners are much alike. They are not polite, and I have never heard them accused of mock, or real, modesty.

The entrance of a stranger into their subterranean abode is a signal for them to approach, and invite him to take a glass of beer. If he seats himself at a table, a maiden brings him the Teutonic beverage, and she generally takes the liberty of bringing a glass for herself. He is expected to pay for both, and he generally does. He pays about twice as much as he would pay for his beer elsewhere, but it has the advantage of being of the most atrocious quality, and as he is favored with feminine society, he cannot complain.

The resident of the city rarely visits the beer saloon of this sort, and by far the larger part of the custom of these

A NEW YORK "DIVE."

establishments comes from countrymen. The city resident has generally cut his eye-teeth in his younger days, and is not a good subject for dissipation; but the countryman has a calm confidence of knowing what he is about, and the result generally is, that he does not know anything about it. He is induced to drink beer or other liquors, and if he drinks liberally, pays liberally, and exhibits a fair amount of money, he is a good subject for robbery. The fascinating young woman who supplies him with his beverage manages to pick his pocket, and he frequently returns to his hotel without money enough to pay for his next morning's breakfast. If they do not find it practicable to rob him, they turn him over to the tender mercies of the masculine loungers connected with the place.

There are several ways in which these parties practise their robberies. One way is by drugging the man into insensibility, and then rifling his pockets, and turning him out, stupefied and half dead, into the street. When there, he may be picked up by a friendly policeman, escorted to the station-house, and there allowed to sleep off the effects of his debauch. Sometimes the robbers make clean work, especially if the victim happens to be a sailor, or other stranger, who has no friends. Money and everything else of value are taken in such a case. If the stranger is sufficiently drunk, he is stripped, and left in a condition that unfits him entirely for a fashionable evening party.

I knew an instance, not long ago, in which a sailor returned to his ship, in the morning, wearing a flour barrel. He had been drugged, robbed, and stripped of everything except a red string, which he wore as a charm about his neck. He waked about sunrise in a cellar-way, and concluded it was time for him to go home. He knew that the population of a city has a prejudice against a man going into the streets naked. Like Flora McFlimsey, he had nothing to wear, and he looked around for something to put on. There was a dilapidated hoop-skirt lying near him, but he did not think it would go far enough to cover his nakedness. An old bird-cage was

also at hand, but, as an article of wearing apparel, a bird-cage is open to objections.

The next object that met his anxious gaze was an empty flour-barrel, and he concluded it would be just the thing. One head of the barrel was gone, and speedily he knocked out the other. Then stepping into this rigid shirt, he supported it under his arms, and walked off as well as he could.

Luckily he had not far to go, and he reached his ship in safety. His garment was a trifle uncomfortable. Besides its stiffness, it had the demerit of a row of small nails where the head had been fastened in; and these had lacerated his skin, so that he looked as if a hundred doctors had been experimenting upon him for vaccination.

Another ancient and intoxicated mariner, on awaking, found himself in a similar cellar-way, where there was not even a flour-barrel to wear. As the story goes, he picked up a newspaper, and attached it round his waist, somewhat after the manner in which the natives of the Sandwich Islands wear their shirts of tappa cloth. He would have succeeded very well with this scanty garment, had not an unprincipled wretch maliciously thrown a bucket of water over him, just as he was starting. Paper and water have an affinity for each other, which generally results in the disintegration of the former. This bearer of the morning journal found himself denuded, with the exception of the pieces of paper which adhered to him as closely as if they had been plastered, and were utterly useless for clothing purposes.

If the visitor to the dive will not drink enough to intoxicate him, he is invited to visit "a game." The game which he visits may be faro, roulette, or something of that sort, and the kind that he sees is euphoniously known as a skin game. The most skilful dresser of eels cannot perform the operation of skinning more successfully than can the dealers and players at this little game.

I once accepted an invitation of a detective officer to visit one of these establishments. We entered a narrow hall-way at the foot of a flight of stairs. A bell was rung, and a col-

ored servant came to the door; but, before opening it, he peered cautiously through a peep-hole. Evidently satisfied with his observations, he opened the door, and allowed us to enter. We mounted the stairs, and passed into the room, where there was a group of twelve or fifteen men. They were not prepossessing in their appearance, and were an excellent collection from which to select a good assortment of thieves and murderers. Some of them appeared to know my conductor, and invited us to drink.

A fear of the consequences, combined with my temperance principles, prevented my accepting anything stronger than a glass of soda-water—a beverage which never intoxicates, no matter how large the quantity taken. This did not satisfy my new acquaintances, and they earnestly requested me to take some spirits, which I as earnestly declined. They invited me to join in the game, but I pleaded ignorance and impecuniosity, and appealed to my conductor to confirm my statement. Evidently they did not consider me a proper goose for plucking, as they did not repeat the invitation.

I could see that all the players and loungers were acquainted with each other, and that the playing was not at all brisk, and by no means interesting. Evidently they were waiting the arrival of somebody with plenty of money. In a little while we heard the ringing of the door bell, and, a minute later, a person who looked like a countryman entered the room in company with an individual whom I had seen, a little while before, lounging on the corner of Houston Street and Broadway.

There was no sudden stir among the men in the room, but there was just a little buzz and movement, sufficient to indicate that the business was about to be interesting. One of the party beckoned my conductor a few steps away, and asked a question which I did not hear. The detective nodded, and I caught the words, "All right." I supposed—and correctly, as I afterwards ascertained—that the question was whether I would "blow" upon the business. The detective's answer appeared satisfactory, and they consented that

I should remain. The man whom I will call Houston Street, from the locality where I first saw him, seated himself at the table where a game of roulette was going on, and invited the countryman to a place by his side. Houston Street began to play, staking a dollar, then five, then ten; and so on, varying from one to ten at a time, and almost uniformly winning.

Countryman was somewhat intoxicated, and proposed to play.

"O, no; you had better not!" said Houston Street.

"Isn't this an honest game?" said one of the bystanders, with well-feigned indignation.

"Yes, certainly," said Houston Street. "I know the place, and have been here many a time; but I brought this gentleman in just to see the game, and I do not want him to risk his money."

Of course this only made Countryman more desirous of playing, and after a few gentle remonstrances from his friend, he was allowed to stake some money.

He was permitted to win a few times, and then invited to take a drink. He drank heavily, and his friend congratulated him upon his luck. This brought him back to the table, and he began playing again, winning and losing alternately.

Another drink followed, and soon another. By this time the man had lost what little caution he may have possessed; and he went on playing very recklessly, until he had lost nearly three hundred dollars, or all the money he had about him. Then he staked his watch upon the game, and lost. Then he put up his overcoat, which followed his watch. In less than half an hour from the time he entered the place, he had lost everything of value about him. He was invited to another drink, and then accompanied Houston Street to the door. He was probably dropped a block or two from the entrance, and allowed to find his way home as best he might. At any rate, within ten minutes after the twain had departed, Houston Street returned alone, and seemed on intimate terms with everybody in the room.

The detective soon nodded to me, intimating that it was

time to go; and we bade our acquaintances good night, and departed. As we reached the street, he said,—

"Now you have seen the 'skin game' in its perfection. Everything about that place was so arranged that the countryman could not win a dollar unless with the consent of the dealer. They can make the game win or lose at their pleasure; and you readily see they do not permit a man to come in there and win anything."

"Suppose he had refused to play?" I asked.

"In that case," said the detective, "they would have got the money from him by rough gambling."

"And what is rough gambling?" said I.

The detective laughed, and answered, briefly, "Rough gambling is knocking a man down, taking his money away from him, and kicking him into the street. Very simple process, and you see it is quite properly called rough."

I admitted the correctness of his assertion.

It may be a matter of surprise that a detective should enter an establishment of this sort, where he was apparently known, and be allowed to witness the operation of fleecing a stranger. The fact is, that the administration of law and justice in New York is hampered with many restrictions. The detective was admitted there only on the understanding that he should make no interference with the game. Had he gone there to make an arrest upon a complaint properly verified before a magistrate, he could make his arrest, and depart in peace; but on the occasion when he went there with me, it was merely a visit of curiosity, and so understood. By his understanding with the gamblers, he was bound in honor not to make any interference with the proceedings, nor to furnish any information which could bring his entertainers into any trouble. Though I had made no promise, I was bound by the same unwritten code of honor; and had I violated the implied promise of secrecy, I might have found myself in trouble before many days. Had the countryman chosen to take any steps against the parties who fleeced him, he could have sworn out a complaint before a magistrate, and the officers

would have accompanied him to the place. Had he done so, they might have defied him, or they might have compromised with him. But in ninety-nine cases out of a hundred, the victim is ashamed of his conduct; and rather than see his name in the newspapers, and be exposed to derision, he will remain silent, and keep to himself the story of his misfortunes.

Occasionally the police make a descent upon these gambling-houses, either on the complaint of a sufferer, or from a sudden, but infrequent, spasm of morality. There is a law in New York against gambling; but the business goes on nightly in hundreds of places, under the very eyes of the police, and only now and then are any steps taken to break it up.

I was subsequently invited by the same detective to join in a nocturnal expedition of an exciting character. Some gambling-houses were to be "pulled," as the police phrase is; that is to say, they were to be entered suddenly, and all the persons therein were to be arrested. The detective took me into his confidence upon my promise of secrecy, and said, if I chose, I could be one of the party in the room at the time of arrest, or I could be of the assailants.

"Suppose," said I, "I am in the room at the time; what will be done?"

"Well," he replied, "things will go on just as you saw them, until there will be a sudden movement. Several men will be knocked down, and at the same moment the doors will be burst in, and the police will seize everybody. Those who can escape by jumping out of the windows into a back yard will do so, and those who remain will be carted off to the station-house."

"Suppose I am in the room at the time; what will happen? Must I jump into the yard? Must I quietly stand to be knocked down, and then be taken to the station-house, and locked up over night?"

"You need not jump into the yard," said the detective; "but there is a chance of your being knocked down — perhaps by one of the gamblers, perhaps by the police, who might mistake you for a gambler. As soon as you get to the station-house,

A DESCENT ON THE GAMBLERS.

and in fact before you leave the room, I can fix it so that the police will not detain you."

I concluded, on the whole, that I would not be present at that performance, either as an insider or an outsider. The gamblers have a prejudice in favor of freedom, and are apt to struggle with the police when a descent is made. I had no desire to serve as a policeman, and be knocked down, or possibly thrown down a flight of stairs, while discharging my temporary duty; and so I did not go.

They made the descent, and a large amount of silver ware, deposited as "stakes," was captured; and half a dozen persons in the room were injured to a greater or less degree in the fight, so that I am convinced I acted wisely. Most of the gambling-houses are above ground, but there are some below the surface. In many of those disreputable dens in the Bowery, gambling is conducted in cellars, where the light is feeble, and the air is bad, and all the surroundings are very uninviting in their character. In one place they have burrowed under the street, and built up an archway, so that a room twelve feet square, and half as high, has been formed. Here there are all facilities for a quiet game; and if the stories told about this place are true, many a robbery has been committed there.

The victim is first intoxicated, and possibly drugged, and then the work of plundering is comparatively easy. He is taken into the street by a passage-way other than that by which he entered, and naturally becomes bewildered if he ever attempts to find the locality again. On the whole, however, he is not very likely to make the attempt.

## XLV.

### THE EARLY HISTORY OF MANKIND.

THE STONE AGE. — PICTURE OF ADAM AND EVE. — HOW EVE CUT THE APPLE. — MINERS OF ANCIENT TIMES. — DISCOVERY OF STONE IMPLEMENTS. — THE INVENTION OF FIRE. — HOW GOLD WAS FOUND. — COPPER AND BRONZE. — THE BRONZE AGE. — IRON AND ITS USES. — MINERAL PRODUCTIONS OF DIFFERENT COUNTRIES. — QUICKSILVER IN SPAIN AND CALIFORNIA. — THE WEALTH OF NEVADA. — ROMANTIC STORY OF THE COMSTOCK LODE. — MINERAL FUTURE OF AMERICA.

THE most extensively worked mineral substance at the present day is coal, yet it is the most recent of mineral discoveries. Iron, copper, tin, and nearly all the metals were dug from the earth, and used long before the value of mineral coal was known.

In the earliest days of mankind, tools for various uses were made of wood, bones, or stone. The first tools were undoubtedly of wood, but the material was so perishable in its nature that no specimens from those early days have come down to us. Stone, being a harder substance than wood, and much more durable in its character, rapidly took its place. The period when the human race was in its infancy has been properly classified as the "Age of Stone," for the reason that man at that time was ignorant of the use of metal. Many implements from the stone age have come down to us, and are found in various parts of the world. In the copper mines on the shores of Lake Superior, many tools have been found which were used by a race long extinct, and of which we have no history.

In opening one of these mines, several years ago, more than a hundred stone axes and wedges were discovered near a large mass of native copper, which had been moved a short distance, and supported upon sticks of timber.

(650)

No implements other than those of stone were found, and all of these had been broken in an unsuccessful attempt to cut the mass of copper in two. In various parts of America, Europe, and Asia, stone implements from the early days of the human race are found, and at the present time there are many savage tribes belonging practically to the stone age.

In some islands of the Pacific the people have not yet emerged from what is to us a very remote period. Barbarism under some circumstances may almost be considered perpetual.

The history of the early days of mankind upon the earth is very largely a matter of conjecture: much of it comes from tradition, and much of it from calculation. The great antiquity of the human race is a recognized fact, and geologists have shown that the period of early barbarism may have extended over tens of thousands of years. Civilization, properly speaking, began only with the discovery of fire and metals.

Some of the Greek mythologists say that Prometheus stole fire from heaven. The more prosaic fact is, that fire was first discovered by means of lightning, which set fire to the forests, and thus revealed to mankind a new element in nature. It is probable that our first parents in the garden of Eden had no knowledge whatever of this element, or of the metals, or even of implements of wood or stone. Consequently the enthusiastic artist of the middle age, who drew a picture of Adam and Eve standing in front of a fire to warm themselves, and represented Eve holding a knife in her hand, with which she was cutting slices from the fatal apple to give to the waiting Adam, was guilty of anachronism.

There are other conjectures of the discovery of fire, but they are purely conjectures. Fire may have been known from the earliest ages, through volcanic eruptions and streams of lava.

People who lived far away from volcanos may have discovered it from the spontaneous combustion of wood after hot and dry summers, or of masses of weeds and rubbish thrown together, and forming peculiar chemical combinations. It is possible that other people may have discovered fire by means

of flint, or they may have obtained it by rubbing two pieces of dried wood against each other, according to the practice of the present day among many savage people.

At any rate, it is probable that the discovery of fire led to that of metals. Fires built against certain rocks may have calcined them, and caused the metals which they contained to be fused together. By some it is thought that the first metal discovered was gold, which existed in the sands of the streams, and would naturally attract attention by its shining appearance.

Even if gold were the earliest discovery, it exercised no great influence on the civilization of the human race; but it was otherwise with the discovery of the commoner metals. From the time these were known, the human race made rapid progress, and written history began with them.

The discovery of copper and tin preceded that of bronze, which is an alloy of these two metals. Copper may have been discovered in its natural state, or in combination with other substances, which could easily be removed by the action of fire. The metal was soft and easily fashioned, but there are many purposes which it could not be made to answer. The localities where this metal was first discovered are not positively known. Some contend that it came from India, while others give credit to that part of England known at the present time as Cornwall.

The alloy of copper and tin for the formation of bronze grew into very rapid use, and it was made of various degrees of hardness, according to the purpose for which it was intended. Wedges, knives, axes, saws, fish-hooks, ploughshares, picks, and a thousand other implements for the uses of peace or of war, were made of bronze. It could be melted and cast in moulds, or it could be hammered and fashioned at the will of the smith. With bronze the art of moulding began. Bronze was used for money. It was cast into utensils for kitchens, and parlors, and other apartments of dwellings. It was fashioned into statuary, and sometimes into statuary of a very vulgar character. Weapons were made of it, such as the

heads of arrows, lances, and javelins, swords, shields, and helmets; while it was useful in peace, it was likewise useful in war. A French writer has said, "The art of killing one another will advance at the same time as all the other arts."

Lead, silver, and quicksilver were discovered about the same time as copper. A long period may have elapsed after the discovery of bronze before that of iron. Doubtless this was in a great measure because bronze supplied all the requirements of the arts of peace as well as of war, and would naturally precede iron, because it was more readily and easily worked. The reduction of iron ore has always been a delicate process, and is attended with more or less difficulty. A strong current of air was required to give sufficient heat to melt the iron. It is quite likely that the first blast furnace was made from the hollow trunk of a tree containing a piston, moving up and down like that of an ordinary pump. This method is still in use among the Malays and the African negroes. While the Polynesians are still in the stone period, the Malays and negroes are just entering the first cycle of the iron period.

Some of the philosophers suggest that this is by the desire of the Ruler of the universe, in order to guide the civilized man of to-day in the study of the early history of his race.

For a long time iron was only used in its malleable form. The discovery of cast iron was not a prime necessity, since its place was well supplied by bronze. Historians tell us that cast iron was discovered about the time of the invention of gunpowder. It was used for making shot, and afterwards for making the guns by which the shot were projected. The English were the first to adopt them, and tried them against the French in the battle of Crécy, about the middle of the fourteenth century.

Step by step furnaces were constructed, and almost every decade witnessed some kind of improvements in their management. Then came the invention by which steel could be manufactured on a large scale. The rapid increase in the use of iron dates, as before stated, from the general use of mineral coal.

Pages could be covered with details of the uses of iron and steel. The production and consumption of these metals amount to millions of tons annually, yet the demand never exceeds the supply. They are fast replacing timber and stone for many uses, and they are substituted for bronze in ornamental castings. No tools or weapons can be made without them. They constitute parts of nearly all machinery; and turn where we will, — wherever civilized men are to be found, — we shall see iron and steel occupying prominent places.

Deposits of metals are found in all parts of the globe. Great Britain is rich in lead, and tin, and iron, and in some localities gold has been discovered. She furnishes other countries with some of her metals, and those which she does not find in sufficient quantities for her own wants she brings from abroad. Many of the metallic ores of other countries are sent to England to be smelted and reduced. On the continent of Europe there are copper mines, silver mines, iron mines, and mines of nickel, zinc, and tin. Some of the deposits of metallic ores are very great. In one place in Swedish Lapland there is a hill rising out of the swampy ground, where there are veins of iron ore, some of them two hundred feet in thickness. Belgium, in proportion to her size, produces more iron than England. Along the valley of the Rhine and its tributaries there are rich deposits of the various metals, some of them of great extent. Russia is rich in mines; and as we go from European to Asiatic Russia, we find that the richness continues.

France has large supplies of iron, and on a small scale she possesses the other metals. In Spain there is great mineral wealth, and some of the mines of that country have been exploited for thousands of years. The most celebrated quicksilver mine in the world is that of Almaden, situated in Spain; and it has been continually worked for three thousand years. Until the discovery and working of the New Almaden quicksilver mine, in California, the famous mine of Spain controlled the quicksilver market of the globe. In Northern Italy there are many districts rich in metallic ores. Throughout Asia,

from the Arctic to the Indian Ocean, there are mines of all the metals, some of them of great richness. Mining industry in that part of the world is still in its infancy, and great discoveries and great progress may be looked for within the next hundred years.

In Africa, as well as in Asia, there are rich mineral deposits, though comparatively little is known about them. The new world is not behind the old in its mineral wealth. Every known mineral substance is found here; and there are evidences that the mines were worked thousands of years before Columbus made his famous voyage across the Atlantic. Some of the largest metallic veins in the world are in America.

Mexico, Peru, and other Spanish settlements on this side of the globe are almost unparalleled in richness. California alone has furnished an immense amount of gold to the hard money circulation of the world, and is destined to furnish still more.

Nevada and the territories lying around it have a wealth of silver unknown, and doubtless inexhaustible. The copper mines of Lake Superior have become famous throughout the world; and the iron mines of the great Mississippi valley and the Atlantic slope may yet supply the world with the most useful and most generally needed metals.

Probably the richest mines yet known are those situated on the famous Comstock lode, in Nevada.

From 1862 to 1865, including both these years, the mines on that lode yielded about forty-eight millions of dollars, and since that time the return has averaged more than twenty millions of dollars annually. The produce of silver from the Comstock vein is about one fourth of the entire amount furnished by all the silver mines in the world. It exceeds the aggregate produce of all European countries, and equals that of the entire western coast of South America.

A French engineer, who visited Nevada some years ago, wrote of it as follows:—

“Its extraordinary productiveness has made the Washoe region more famous for its mineral wealth than many places where silver ores have been found, and mined for centuries.

It has attracted an enormous civilized population. It has built cities in the desert, and roads across high mountain ranges, accelerated the union by steam of the Atlantic and Pacific coasts of America, created a new branch of mining industry in the Pacific states, and given successful employment to large amounts of capital."

The original mine of the Comstock vein is known as the Gould and Curry. It originally belonged to two men whose names it bears. Gould sold out his share for a pair of blankets and a bottle of whiskey. Curry disposed of his interest for a horse and two thousand dollars. One of the mines on the same vein was bought one day for two thousand dollars, and six weeks afterwards was sold for nine hundred thousand. Some of the most remarkable mining speculations ever known in the history of the world have occurred in Nevada.

A long story could be told of the various countries of the world, and of the productions for which they are famous; but it is hardly necessary in this place, and very likely would become tedious. Scarcely any part of the globe can be mentioned where some mineral of value is not found, and the various substances seem to be distributed in such a way as to develop intimate relations among the various members of the human family, and to draw nations nearer and nearer to each other.

England exchanges her iron and coal for the produce of other nations. Spain sends her quicksilver. Chili sends her copper. Mexico and Peru send their silver, and receive in return the articles which they need, and other nations can spare. Other countries send their minerals to distant markets, and receive in return the products of the countries where those markets exist. America, with her mines, is comparatively in a state of infancy; but the day will come — and it is not far distant — when she will be the great supplying centre of a large portion of the globe.

## XLVI.

### RAPID TRANSIT IN NEW YORK.

THE UNDERGROUND RAILWAY SCHEMES. — ELEVATED RAILWAY LINES. — THE WEST SIDE RAILWAY. — TRAVELLING ON LAMP POSTS. — ADVANTAGES OF A SECOND STORY ROAD. — ADVENTURES WITH THIEVES. — PERILS OF THE MODERN STREET CAR. — ARTISTIC PACKING OF PASSENGERS. — THE PNEUMATIC RAILWAY. — VANDERBILT'S SCHEME. — AN UNCOMFORTABLE JOURNEY. — SHOT FROM A GUN.

For several years the people of New York city have been agitated on the subject of rapid transit from one end of Manhattan Island to the other. In one respect, New York is unlike any other city on the globe. Nearly all its business is conducted at one end of the island on which it stands, while nearly all the residences are at the other end. Consequently, a large part of the population must be transported in the morning from the upper part of Manhattan Island to the lower end, and transported back again in the afternoon and evening. All the lines of street railway and the stages are densely crowded at these times. There is not a street car or an omnibus that is not packed to its fullest capacity, in the morning, with people going down town, and packed in a similar way, about sunset, with people going up town.

Travel at these times in the direction indicated is accompanied with many annoyances. On some of the lines of street railway, the passengers are stowed away very much like sardines in a can, or like negroes in the hold of a slave ship. Comfort is not at all considered. Every man is anxious to reach his destination as speedily as possible, and if the seats are all taken, he is willing to stand. Very often passengers are wedged so closely that the movement of one affects nearly all the rest, and a person near the middle of the car

finds it hard work to get out. Straps are suspended from horizontal bars running fore and aft the car, and the standing passengers suspend themselves from these straps.

An ingenious individual has devised a plan whereby the space above the heads of the standing passengers may be utilized. He proposes some additional straps, on which a few passengers can be suspended horizontally, very much as dried fish in a museum are hung up against the wall. The position would be uncomfortable, but comfort is a secondary or tertiary consideration altogether.

The ordinary street car is designed to seat thirty-two passengers, but very often as many as a hundred passengers are crowded on a single vehicle. The front and rear platforms are occupied down to the very edge of the steps. It is uncomfortable enough when the passengers are sober and well-behaved; but when, as often happens, half of them are drunk, and fifty per cent. of the drunken ones are quarrelsome, the position becomes serious. A man who travels late at night on a main line of street railway will have his love for sport fully gratified. He may expect a broken rib every week or two, and, as the noble and manly art prevails among the drunken gentlemen, he can be accommodated with a fight whenever he wishes it, and very often when he doesn't.

The modern science of pocket-picking is very much in fashion in New York, and a goodly portion of the inhabitants seem to be engaged in an effort to make an honest living by robbing the rest. On a densely crowded car, one can frequently see gangs of pickpockets, varying from two to half a dozen persons, and unless he is very attentive, they will go through him without his knowing it. They are skilful operators, and the rules of the profession forbid the practice of the science until the artist is able to pick away a man's eye-winkers without his feeling it. I always look with pleasure on a man who boasts that no pickpocket can rob *him*. His confidence begets carelessness, and the result is, that he is generally robbed more than any other man.

With a long experience on street railways, it has been my

**SECTION OF THE BROADWAY UNDERGROUND RAILWAY.**

pleasure to suffer the depredations of pickpockets several times; and I will do them the credit to say that their robberies were almost always committed when I was on the lookout for them, and was quite confident they could do me no harm. They never took my watch or pocket-book, but on two occasions they have taken a letter case out of the inside pocket of my coat, and once invaded my trousers, and carried off a card case which had no cards in it. They have gone through my overcoat, and relieved it of kerchiefs, and gloves, and such trifles, and I was in blissful ignorance of their operations until some time afterwards, when I happened to put a hand in my pocket, and found that my property had gone.

Quite often I have seen the pickpockets "working" a car, and have admired the effectual and artistic manner in which they perform their duty. A few days before writing this description, I travelled with five of these individuals on my way down town, and saw them go from one end of the car to the other, — the vehicle was very much crowded, — and after taking what watches and pocket-books they could find, they left from the rear platform. The cry of robbers was raised a little too late, and when the first announcement was made that valuables had disappeared, they were off the car and three or four blocks away. Two pocket-books and four watches were the result of that evening's enterprise — a very fair compensation for five minutes' work.

The omnibuses are somewhat better in character than the street cars, though they do not afford accommodations for standing, especially if the passenger happens to be in the vicinity of six feet high. Many persons do stand in them, however, and revenge themselves for their discomfort by treading on the toes of the sitters at every lurch of the carriage. Intoxicated people do not ride in the omnibuses as much as in the street cars, partly for the reason that the majority of drunkards live on the railway rather than on the omnibus routes, and partly for the reason that it is not so easy to enter an omnibus as to enter a street car. The car has a conductor, whose duty it is to assist passengers on board

and collect their fares, to kick off the disorderly ones, and keep everybody on good behavior. Between the pickpockets and passengers, the conductors generally occupy a neutral position, very much like the woman in the celebrated contest between her husband and a bear. The omnibus has no conductor, and as no one is responsible for the conduct of the passengers, they generally behave much better than on board a street car. If a man misbehaves himself in the former vehicle, his fellow-passengers eject him; but in the latter conveyance, the passengers do not wish to take upon themselves the conductor's duty, and as he is generally unwilling to perform it, it is not performed at all.

Time is an important consideration on these lines of travel. There are so many stoppages for landing and receiving passengers, so many blockades arising from vehicles in the street, and from other causes, that the journey from end to end of Manhattan Island is not a rapid one. From the City Hall to Harlem, the ordinary time required is an hour and a half, and proportionally for other distances. The omnibus is even slower than the street car, as it has not the advantage of rails on which to move, and makes frequent stoppages to wait for its passengers. The consumption of time in city travel, added to the annoyances, makes it very desirable that a more perfect system should be devised.

Consequently the question of rapid transit has been very much debated, and several schemes have been proposed. I shall not attempt to give all the systems proposed for public consideration, as they would occupy much more space than I have at my disposal. Some inventors propose an underground railway, and some propose a railway elevated sufficiently high to offer no obstacle to the passage of vehicles. There has been a great deal of talk on the rapid transit question, but up to this time comparatively little has been done. A single track has been placed in the air on iron posts something like lamp posts, and carried from the Battery through Greenwich Street, and connecting streets and avenues, as far as Thirtieth Street. It is very doubtful if it ever gets any

TUNNELING BROADWAY FOR THE UNDERGROUND RAILWAY.

farther, or if anything more than a single track is built. The enterprise thus far has not met the expectations of its projectors. It has swallowed up a great deal of money, and secured very little travel. It carries passengers at a fair speed, but it has had two or three accidents that have rendered the public distrustful of its accomplishments.

It possesses one advantage — that of enabling strangers to study the private life of the people on second story floors along its route; and for this reason I presume distinguished foreigners, who come to New York, are generally invited to make a journey over this railway. By no other means now known can so good a knowledge of the domestic habits of New York be obtained. A gentleman who made a journey in one of the cars of this road soon after its opening, stated that he counted ninety-seven families at breakfast, of whom thirty-three were eating fish, twenty-seven were eating beefsteaks or mutton-chops, while the balance were sticking to bread and vegetables in various forms, or were breakfasting on nothing at all. He saw thirteen family quarrels in various stages of progress, and observed one lady, apparently of foreign origin, discussing home affairs with a broom-handle. He obtained an intimate knowledge of wearing apparel for both sexes, and saw a great many things he had never seen before, and hardly expected to see on so short a journey.

Soon after this Elevated Railway was begun, some enterprising gentlemen undertook the construction of a railway under Broadway, on the pneumatic plan. They leased a cellar at the corner of Broadway and Warren Street, dug a tunnel under the sidewalk, and thence directly under Broadway for a distance of two hundred and fifty feet. It had been claimed that an underground railway could not be made beneath Broadway without interfering greatly with the traffic of that busy thoroughfare. The projectors of this line, known as the Beach Pneumatic Railway, contended that they could do their work without interference with travel, and they not only did it in that way, but they kept the entire public ignorant of their operations until they were

ready to throw open the completed portion of their line for inspection. They were at work three or four months before any outsider obtained the least hint of what was going on, and for the last few months of their work, the public dwelt almost entirely in conjectures. It leaked out that something was being done there, but what it was, nobody could exactly tell.

Finally, a certain day was fixed for the opening, and a great many persons were invited to be present. They found a comfortable station and waiting-room under the sidewalk of Warren Street. They found a passenger car on the track, and a well-lighted tunnel, through which they could walk, and listen to the rumbling of carriages overhead. The tunnel was as dry and comfortable as brickwork and whitewash could make it. Telegraph wires extended from end to end, so that communication could be had at any moment with the engineer; and although the distance was short, the car, in moving along the track, attained considerable speed. They found powerful machinery, capable of forcing thousands of cubic feet of air per minute, and propelling the cars at a rapid rate. The machinery was moved by steam power, and the cars were propelled by the force of the air pressing against them. Whether the tube was five yards in length or five miles, as long as it remained tight the car could be driven by the power of the stationary machinery.

Unfortunately for the rapid prosecution of the enterprise, the Pneumatic Railway was not, for the purpose of carrying passengers, a chartered institution; and up to the time of writing, it has never progressed farther than a single section, between Warren and Murray Streets. Its projectors have full faith in its ultimate success, and certainly the result of their enterprise, so far, has been satisfactory. They claim to be able to drill their tunnels for any distance, under any part of the city, without interfering with business; and they even propose to push their way under the East River, and thus extend their route to Brooklyn. They propose to have stopping-places every half mile, where passengers can be taken up and

**INTERIOR OF PNEUMATIC PASSENGER CAR.**

**PORTAL OF THE BROADWAY TUNNEL.**

left, and they promise to run their cars from one end of New York to the other inside of half an hour. They promise that there shall be comfortable weather at all seasons of the year, and are very certain that their route will never be blocked with snow. They assert that collisions are impossible, because their mode of propulsion is such that two cars cannot approach or go from each other on the same track at the same time. One of the great troubles of operating a line of railway by steam is the impossibility of making two trains pass each other on a single track. Many a railway engine-driver has attempted it, but on every occasion he has come to grief, and has generally brought some of his passengers to an unhappy end. On an atmospheric railway the attempt to make such a meeting and passage is, from the nature of things, impossible; consequently accidents from this cause can never occur.

Another atmospheric railway proposed for New York is to be elevated in the air. An iron arch is to be thrown over the streets or avenues, sufficiently high to permit the passage of vehicles beneath it, and sufficiently strong to sustain a great weight. On the top of this archway two large tubes are to be placed, each tube nine or ten feet in diameter, and having a railway track inside, where car-wheels can run. The pneumatic system is to be applied to the propulsion of these cars, very much as it is used to propel the cars on the underground line already described. It would possess most of the advantages of the underground system, and there is no good reason to predict the failure of a line constructed in this way.

Another elevated railway has an iron arch, similar to the one just mentioned; but the roadway is open, and the cars are propelled by steam. Its advocates are sanguine of success, and its opponents say that it would frighten all the horses that come anywhere in sight of it when its trains are in motion. But if the horses choose to get frightened, that is their affair; and the probability is, that they would soon become accustomed to the strange noise, and behave themselves properly. Horses can be accustomed to anything. All that is wanted is proper training.

Somebody has proposed a three-tier railway, having one line or track under ground, another at the surface, and another elevated high in the air. His scheme is a magnificent one, and has a good many advocates; but the probability is, that some of the rival enterprises will be completed before this is adopted, mainly for the reason that the cost of their construction is much less.

Three or four years ago an underground railway company was chartered, and set about the construction of a line. A little work had been done, and only a little. The route was surveyed and laid out, and the managers of the company set about raising the needed capital. Somehow the desired money was not forthcoming, and up to this time the railway has existed more on paper and in the minds of its advocates than in the locality where it was to be constructed.

A year or so after this line was chartered, another scheme was proposed for making a railway on brick arches, to be known as the Viaduct Railway. It was in the hands of men then in power in New York, and soon after the organization of the company it was announced that a large amount of stock had been taken. The route was surveyed, and maps were published, showing the proposed line of travel. There were many real estate speculations growing out of it, and the supposition is, that the managers of the Viaduct Railway pocketed handsome amounts of money out of these speculations; but somehow the public did not grasp with any confidence the enterprise, which was in the hands of the magnates of the Tammany Ring, and the Viaduct Railroad, at the time I write, exists only on paper.

After this failure to meet the much felt want, the genius of Vanderbilt was brought into action. The commodore, as he is called, was able, by the influence he could bring to bear on the legislature, to secure a charter for an underground railway from City Hall to the upper end of the island. He went at it in a business-like way, and promises that before 1876 one can ride under ground from the City Hall to Harlem in twenty minutes. We shall see what we shall see. If Vander-

bilt will give New York what it wants, it will tender him its warmest thanks, and erect a statue to his memory. If the great Railway King could live to the age of Methuselah, and enjoy good health, he would doubtless, before the day of his death, attempt an underground line from New York to Liverpool, in order to increase the business of the New York Central Railway.

Among the schemes that have been proposed for rapid travel and transportation of freight, there is one which purposes to make use of tubes, either under ground or on the surface, in which spheres or globes shall be placed, and propelled by means of a rapid current of air. The inventor claims that a sphere will move through a tube with very little friction, and can be driven with great rapidity. He would make a tube several feet in diameter, and have his spheres so arranged that they could be opened and filled with freight, then closed, properly fastened, placed in the tube, and started. I believe that he proposes to propel them one or two hundred miles an hour, at comparatively slight expense. For certain kinds of freight this mode of transportation and propulsion might be well enough, but there are things for which it would not answer. Imagine, for example, one of the spheres filled with fresh strawberries in Virginia for transportation to New York. The strawberries would be constantly rolled against each other, so that by the time they reached New York they would be in a condition of jelly.

As a passenger route this line would have great disadvantages. Imagine a man enclosed in a sphere, either doubled or laid out horizontally, to make a journey from New York to Washington. He would be standing alternately on his head and on his feet about one hundred times a minute, and if he went through alive it would be a wonder, and he would be likely to be very much confused; especially if he were not packed tightly in his travelling-box, he would have a rough time of it. Every square inch of his body would be covered with bruises, and, besides, he would have a hard time to breathe, as the supply of air would be exceedingly limited.

I believe the inventor proposes that all parcels going by his route should be tightly packed ; consequently, it would be necessary to wrap the passengers and secure them somewhat after the style of an Egyptian mummy, and stow them in their places by means of an hydraulic press. None of this mode of travel for me, if you please.

I have heard of a scheme of locomotion in which the inventor proposed to load his passengers into a large cannon, having a bore of three or four yards, and then shoot them to their destination. The journey could be made fast enough, but such a mode of travel is liable to accidents, both on starting and stopping. If one could get off and be well under way without being singed by the powder, he would run a great risk of being somewhat injured when reaching his stopping-place. "It was not the falling," said a hod-carrier one day, speaking of a tumble of twenty or thirty feet, — "it was not the falling that hurt me, darling, but the stopping so quick at the end."

Just as this book goes to press, it is announced that the Beach Pneumatic Railway has passed both branches of the New York legislature, and received the signature of the governor. The Gilbert Elevated Railway is under contract, and its managers promise that three miles of the line will be completed this year. Let us hope that all the promises about these roads will be fulfilled.

### BRIGANDAGE AND PIRACY.

RELATIONS OF THE STEAM ENGINE TO HONESTY. — PIRACY AND STEAMSHIPS. — HOW THE SLAVE TRADE WAS BROKEN UP. — STORIES OF BRIGANDS. — EXPLOITS OF SPANISH ROBBERS. — "ROAD AGENTS" IN CALIFORNIA. — AN ADVENTURE WITH HIGHWAYMEN. — AN ARMED STAGE COACH. — THE HAUNTS OF THE ROBBERS. — STORY OF A PLUNDERED PASSENGER. — "PUT UP YOUR HANDS." — AN EXCITING INCIDENT. — BROAD-HORNS AND KEEL-BOATS. — MIKE FINK AND THE CLERGYMAN. — PIRACY ON THE MISSISSIPPI. — A FIGHT WITH RIVER PIRATES. — A CAPTAIN AND CREW MURDERED. — VISIT TO A ROBBERS' CAVE.

THE invention of the steam engine, while it has done a good deal for honest labor and honest enterprise, has done just as much towards breaking up dishonest enterprises and occupations. Before steamships came into fashion, the broad ocean and its adjacent waters were in many places the cruising grounds of pirates. They had sailing vessels built very long and low, with large spars, and, in proportion to the size of their hulk, with an immense spread of canvas. In a light wind or a heavy breeze, they could outsail the deeply and richly laden merchant ships, whose breadth of beam was great in proportion to their length, in order that they might carry heavy cargoes. These pirate vessels either sailed on the open ocean, in the track of merchant ships, or were concealed along the coast, whence they could dart out, and, after securing their prey, could sail back to their safe retreats. It was impossible to avoid them, impossible to escape them in a fair race, and, from the great number of men they carried, generally impossible to contend against them. Ships of war, like merchant ships, depended upon the wind for their propulsion, and were rarely able to sail as rapidly as the pirate craft. The invention of the steam engine was followed by the construc-

tion of the steamship; and when the steamship was armed with guns, she could run down and destroy these pirate cruisers.

Piracy in the West Indies and other regions, as well as on the open sea, came to an end when steamers were brought into general use as ships of war. At the present day, piracy prevails only in those portions of the far east where the steamer is in comparatively little use.

The slave trade received its death blow within the past twenty years, when England and the United States, with other nations interested in its suppression, substituted war steamers for sailing ships along the coast of Africa. From the ports of the west coast of Africa, where the slave ships were laden, it was comparatively easy to escape under cover of a dark night; and, once fairly at sea, the slavers could bid defiance to their pursuers. With the wind, all had the same chance, and the slavers were generally so constructed and equipped as to be able to outsail their pursuers; but it became otherwise when the latter availed themselves of steam.

On land, in past times, brigandage flourished, and was profitable until the railway came into general use. A stage coach or a carriage with a private traveller, on a lonely road, might be robbed with comparative ease; but when the stage coach or the private carriage was exchanged for the railway train, robbery was not so easy. Enterprising brigands in Spain and other countries occasionally try their hands at robbing railway trains, but such exploits are rare. Safety in every way, whether against accidents or human malice, is rendered much greater by the use of steam. At the present day the countries most affected with brigandage are those where railways are comparatively scarce. Until within the past few years, California had no railway lines, and she was the most profitable field in all the United States for the exploits of robbers. Californians facetiously call highwaymen "road agents," and I have heard sometimes that the Californians are proud of their existence.

I remember some years ago taking a stage coach in the

Golden State over a route infested with robbers. I had heard vague rumors of exciting scenes along the road, and we had no great objection to a small encounter with these artists of the revolver. As we started from the station near the infested region, the agents of the stage company furnished every man with a rifle, and told us to keep a sharp lookout for the road agents. About half of us were accustomed to fire-arms, but the other half evidently knew as much about the handling of a rifle as a horse knows about geometrical surveying. I was fearful at starting that, if we came to a fight, the accidents among us by the careless handling of our rifles would have caused more mortality and inflicted more wounds than the fire-arms of the robbers.

There were several points on the road where the robbers were looked for, and when we approached one of them, the driver would call our attention to the fact. Then everybody would move about in his seat, and straighten himself like a rooster ready for crowing; and some of the more timid ones would start as though they had suddenly dropped upon a chestnut bur. Our rifles were held in all sorts of ways, and with the barrels sticking out in different directions, the coach bore a faint resemblance to an enormous porcupine. Each of the dangerous places we passed without accident, and at the next station we left our rifles, and were thankful that the great peril was over.

I afterwards learned that the robbers had fully determined to attack us that day, but one of the party had gone on a drunk, and deranged their plan. Before that time I had regretted the habit of intemperance among the Californians, but when I heard of this occurrence, I was thankful that the principles of Father Mathew did not prevail among them. With all due regard to John B. Gough and the cause he has advocated, I have no objection to every robber in the world getting blind drunk every morning, and remaining so for forty-eight hours at least.

Robberies on that route were of quite frequent occurrence. Since that time the railway has taken the place of the stage

line, and the robbers are heard of no more,—all honor to James Watt and George Stephenson!

One of my fellow-passengers of that day had been over the route many times, and had been engaged in several fights. He entertained us with pleasing accounts—that is to say, the accounts were very interesting, but just at that time they were not calculated to be cheering.

“About a month ago,” said he, “I was riding along this very road, and in this very coach, and just about this place; it may be half a mile or so ahead from here.” Here a dyspeptic individual at the corner of the coach gave a groan, and muttered something which sounded like a wish that he was at home.

“It was just about daylight, when all at once the horses stopped.” Here the coach came to a sudden halt, and every one of us fully expected that the robbers had taken our horses by the bridles; but the voice of the driver reassured us, as he said he had stopped to hitch up a trace.

“When they stopped the coach,” continued the traveller, “I was just rubbing my eyes, and wondering how much longer it would take us to get through. All at once, I heard some one yell out to the driver, ‘Sit still there, and hold up your hands!’ And just about that time, an ugly-looking revolver came through the curtains of the coach, and a fellow with a mask on stuck his head partly through. ‘Now, gentlemen,’ said this robber, ‘just step out here on the ground, and don’t go putting your hands around your pockets. If you do, you will get shot.’ His manners were so fascinating that we could not resist. It was not very light, but as he held that pistol under my nose, I could almost swear that I could look down to the bottom of the barrel, and see the bullet resting there. We stepped out, one by one, and as we did so, there were two other fellows with masks on waiting to receive us.

“‘Put up your hands,’ said the first robber to each of us, as we stepped out of the coach. ‘Put up your hands, or you will get a bullet through you!’

“I would rather put up my hands at any time without hav-

ing a bullet through me, and I put them up at once. They stood us up in a row, with each fellow sticking his hands up in the air, like a class of school-boys ready to answer questions. Then, when they got us all out, two of them stood guard, and a third went through us. He went through us first for our pistols, and took every one, and laid them in a pile on the ground, right between the two robbers, and in such a way that we could not get at them without being shot.

"They then went through us for watches and money, and they made a very good haul. I did not have much—only just enough for my expenses; and when I told them so, and they saw it, they told me I had better keep it.

"There was one passenger, though, who had twelve hundred dollars in coin. They took the whole lot, but generously gave him twenty dollars to pay his expenses. 'Nothing mean about us,' said one of the robbers, as he handed back the twenty-dollar gold piece. 'We don't want to be rough with any of you, but we must make our living.'

"When they had cleaned us out, they let us go back into the stage. They told us to keep still, or the first man that moved would get his head shot off. One of the fellows stood by the door of the coach, to see that we obeyed orders. He was not going to have any fluking.

"Then they made the driver and express messenger hand down the express box. The box was heavy, as it had a considerable amount of money in it. The messenger was reluctant to give up the money, but they finally persuaded him to do so, by cocking a pistol so as he could hear it, and putting the muzzle of it into his ear. The driver was obliged to sit still, with his reins down and his hands up. The whole operation did not take ten minutes, and when we were through, and ready to start, we were a comical picture. All of us inside were holding up our hands; the messenger had his hands up in the air, and the driver was holding one hand in the air, and taking the reins in the other from one of the robbers. The fellows stood there, with their pistols ready to shoot, and told us to go ahead; and you bet we did go ahead."

In the early days of navigation on the Mississippi and its tributaries, before the construction of steamboats, there was a great deal of piracy. Before the steamboat was invented, the navigation of the great river was conducted with rafts and keel-boats. The raft was built on the upper waters, freighted with produce, and floated down to New Orleans, where both the raft and its cargo were sold. It floated with the current. It would descend, but it could not be made to ascend. The keel-boat was of better construction, and after floating down the river with its cargo, it was loaded to ascend it.

A long time was required for this upward voyage. The current of the Mississippi is very strong, running in many places four or five miles an hour. Sails are of very little use, as the river is crooked, and the wind is rarely strong. The keel-boats were propelled in two ways—first, by “setting-poles;” and, secondly, by “cordelling.” In propulsion by means of setting-poles, long poles are used, and set or fixed temporarily in the bed of the river. There is a plank on which men can walk along the edge of the boat. The man with his setting-pole goes to the bow of the boat, fixes the pole, and then walks slowly aft. In this way the boat is moved under his feet, and propelled up stream.

Cordelling is a system of towing. The men walk along the banks of the river, and tow the boat by main strength against the stream.

The advantages of steam over this old process of propulsion may be well illustrated upon the Ohio River, between Cincinnati and Louisville. The distance is about one hundred and fifty miles. In 1794 keel-boats made regular trips between the two cities, carrying freight and passengers. For the round trip they required four weeks. A steamboat now leaves Cincinnati at noon, and lands its passengers in Louisville the next morning. By noon she is ready to return again, and makes the round trip, with plenty of time in port, every two days.

The boatmen of the Mississippi in the olden time were a

**THE KEEL BOAT**

**A MISSISSIPPI RAFT.**

peculiar class. Rough, hardy, uncouth fellows they were; ready at any time for an adventure, generally delighting in a fight, and able to perform a great deal of hard work. They were prompt at fairs, races, and all other assemblages along the river banks; and when they landed in a town, and concluded to clean it out, they generally did so. The inhabitants being powerless, the boatmen had it all their own way.

The West is full of stories about these boatmen and their peculiar lives. One of the most famous of the class was Mike Fink, whose history has been made the theme of a popular story. A story is told of a clergyman from the east travelling down the Ohio River, some years ago, who was anxious to learn something about Mike Fink. Somebody told him that the pilot of the boat on which he was travelling had been acquainted with Mike. The clergyman approached him, and said,—

“Do you know anything about Mike Fink?”

“Yes,” said the pilot; “knew him like a brother.”

“Can you tell me some peculiar incident of his life?” asked the clergyman.

“Well, I don’t know,” replied the pilot, hesitatingly. “Yes, I can. He ate a buffalo robe once.”

“Ate a buffalo robe!” said the clergyman, astonished.

“Certainly, a buffalo robe, with the hair on,” replied the pilot.

“Well, what did he do that for?”

“Why, you see,” said the pilot, resting a moment, to shift his quid of tobacco, “you see, Mike drank so much whiskey that he destroyed the coating of his stomach, and the doctor told him that before he could get well, he would need a new coat for it. Mike thought the thing over, and said, when he had a new coat for his stomach, he would have one that would stand the whiskey; and he made up his mind that a buffalo robe with the hair on it was just the thing, and so he sat down, and swallowed it. He could drink any amount of whiskey after that, and never so much as wink. Fact, now, as true as you are standing here.”

The clergyman turned away, satisfied.

Besides such adventures as fighting with each other, and with the inhabitants along the river, these men had conflicts with robbers. There were many gangs of robbers living along the Ohio and Mississippi Rivers, and they had places of resort known only to themselves. Some of the limestone cliffs abound in caves, and here the robbers generally had their concealment. They watched for the boats ascending and descending the river, sometimes fired upon them from the bank, and sometimes came out in skiffs to capture them. Many a boat, while quietly anchored for the night, has thus been attacked, and its crew murdered, and thrown into the river. The boat would then be drawn to the spot most convenient for the robbers, plundered of its contents, and set on fire; or it might be manned by a portion of the gang, taken to New Orleans, and sold.

Such an occurrence was not unfrequent, as a rapid passago down the river would enable them to sell the boat, and return again to their place of concealment, before the officers of the law could go in pursuit.

There are many interesting stories in the robber history of the great valley. One was told to me, some years ago, by an old steamboat-man, who had worked in his younger days on board of keel-boats and "broad-horns," as the flat-boats were generally termed, and are now to the present day. I give the story, as nearly as I can remember it, in his own words.

"There used to be a famous place for robbers on the lower part of the Ohio, down below Paducah. Many a boat has been captured there, and the men on board of it were never heard of afterwards. They were a desperate lot of fellows. These robbers did not mind killing a man any more than you would mind killing a rat. I shipped on board a broad-horn once, from Louisville, going to New Orleans. We had a load of pork and corn, and the captain of the broad-horn owned about half the boat and her cargo. We got along very well without any trouble until we got down to the place where these robbers were, and just there we ran on a sand-bar. It was a ticklish

place. There we were stuck; the river was falling, and if it left us on the bar, we would have to stay there until the next rise — that is, if we did not die in the mean time. We worked away all the afternoon, and all night, but to no purpose. One after another, we had dropped off, and gone to sleep.

“We were about a quarter of a mile from the shore, but the current was not very strong. Towards morning, when I was on watch, I heard some men on shore. A little while afterwards, I heard the sound of oars, and saw a boat coming out of a little creek just above us. By the sound of their oars I knew that the boat was coming towards us, and I waked everybody. The captain got out his own rifle and every rifle and pistol that was in the float, and prepared to make fight. When the boat got within fifty or sixty yards, and we could just see it through the mist, our captain yelled out to them to stop.

“‘Want to come aboard,’ said a voice from the boat. ‘We want to buy some pork and corn. We are camped here, and have got short of provisions.’

“‘Haven’t anything,’ said the captain; ‘not a thing. We have not a pound of pork or corn on board.’

“‘What have you, then?’ came from the boat.

“‘We are taking a load of stone down to New Orleans, to sell — limestone, first-rate limestone; you don’t want any of it.’

“The boat kept coming on, and somebody in it said, ‘Come to think of it, now, we do want some limestone, and we will come and see how it looks.’

“The captain saw that we were in for a fight, as the fellows were determined to rob us. He brought his rifle up to his shoulder, but before he fired, he said once more, —

“‘Now, I tell you, STOP!’

“The boat did not stop, but kept straight in our direction. The current swung it a little down stream, or they would have been on board of us before we could have done much against them; but luckily their stern swung around, and they had to turn a little against the current. The captain fired, and brought down one of the fellows in the boat. There were

six or eight of them, and only five of us. I had a rifle, and I fired, and brought down another.

"The captain's man fell into the bottom of the boat, but the one I shot threw up his hands, and tumbled backward, so that he went overboard. They began firing, but did not hit any of us — except one ball, which clipped a corner of the captain's ear.

"By this time they appeared to have had enough of it, and, besides, our shooting deranged their rowing. We were reloading, and before they could get up to the boat, we would have another round of shots for them. They turned down stream, and that was the last we saw of them.

"In the morning we carried a line ashore, and tied it to a tree; and with this line we managed to pull ourselves off. It was tough work, that, and it was noon before we got away. We floated on down the river, and got to New Orleans all right. We sold out our load, and came home.

"The next year I went down again with the same captain, on another broad-horn. When we got to this place where we had been aground, we gave the sand-bar, a wide berth, and avoided it; but we had another fight with the robbers one night, when we were anchored. They came upon us suddenly, when all but two of us were asleep. They got possession of the boat. They killed the captain, and sent me overboard. What they did with the other men I never knew, but I suppose they killed them.

"The whole fight did not last three minutes, from the time they first sprang aboard until I was in the river, and floating away on the water. I must have gone down the stream three or four miles, keeping my head above water; and at last I came to the shore, right under a rocky cliff.

"I climbed up, and squeezed the water out of my clothes. By this time it was morning. I looked around, and saw, a little way off, a curious looking hole in the rock, and something like a path leading up to it. I went up this path and into the rock.

"A fire was burning close by the entrance, and I thought

PIRATES OF THE MISSISSIPPI.

somebody must live there. It never occurred to me that the place might be a robbers' cave. I shouted, and nobody came out. Then I picked up a brand out of the fire, and waved it until it blazed, so as to light me into the rock.

"After going about twenty feet along a narrow passage, I found myself in a sort of room, thirty or forty feet square. It looked partly natural and partly as if it had been dug out of a rock. There were piles of stuff where the men slept, and there were goods of various sorts lying around; but nobody was there. There was a bag of silver dollars which my eye happened to rest upon, and I picked it up. I then thought that I had got into the cave of the robbers, and that it was the same crew that was in the boat. I went out of that place quick, and it was well I did so.

"When I got outside, I could see the boat coming, not half a mile away, and those fellows on board. If I had staid fifteen minutes more, they would have caught me.

"There was no way of escaping up the face of the cliff without their seeing me, so I crawled down to the water, and slipped in again. I could swim well, and thought the best thing to do would be to float down the river a few miles farther, and then get ashore wherever I saw a house or a boat.

"I tried to keep the dollars, but they were too heavy; they weighted me down, and I very soon dropped them, consoling myself with the recollection that the robbers never would get them again. I floated half a dozen miles down the stream, saw a house, and went ashore. Next day a flat-boat came along with one hand short, and I shipped on her to New Orleans. After that I had two or three fights with the river pirates, but they never bothered me much."

## XLVIII.

### SILVER MINES AND MINING.

**ANTIQUITY OF SILVER. — REAL ESTATE AND SLAVE PURCHASES IN BIBLICAL TIMES. — SOLOMON AND HIS SILVER SPECULATIONS. — ABUNDANCE OF SILVER AMONG THE ANCIENTS. — THE EARLIEST MINES. — ORIENTAL EXAGGERATION. — SPANISH MINES AND THEIR HISTORY. — MEXICAN MINES. — A NON-DESCRIPT ANIMAL. — NOVEL WAY OF OBTAINING A PIGSKIN. — PERU AND ITS SILVER. — A HIGH-TONED CITY. — ARIZONA. — BEAUTIES OF ARIZONA CIVILIZATION. — MINES OF UTAH AND NEVADA. — SAD RESULTS OF A SPECULATION.**

ONE of the most important of the precious metals is that known as silver. The ancients were familiar with it, and from very early periods it has been a common medium of exchange, and is used as such among all nations who recognize a metallic currency. It is one of the metals mentioned in the Old Testament, reference being made to it as constituting, among other things, the riches of Abraham. Abraham made a real estate transaction by purchasing the field of Ephron for four hundred shekels of silver. Twenty-nine pieces of silver were paid for Joseph at the time his brothers disposed of him and gave a bill of sale; and throughout the Scriptures there are many other references made to the same metal.

Those who have given attention to the subject think that gold was first known and used as money, partly for the reason that it is more frequently mentioned in the earlier histories, and also from the fact that gold is obtained in a metallic state, while silver must generally be separated from ores in which the metal is concealed. The Egyptians and Hebrews were familiar with gold and silver, and employed them both as a circulating medium, and for the manufacture of jewels, vases, rings, and other articles for household or

DISCOVERY OF SILVER IN PERU.

INTERIOR OF A SILVER MINE.

personal use. The oldest known coins are of silver, though there are gold coins of nearly as great antiquity.

It is a little curious that the ancients possessed silver in greater abundance than people of the present day. It is possible that the old historians drew the long bow a little in describing it, and due allowance may be made for their statement. In the time of King Solomon, silver is said to have been so abundant as to be considered of very little account, and the king had made it to be as stones in Jerusalem. Polybius says that it was largely employed, together with gold, in the form of plates for covering the beams and pillars of the temples, and the tiles upon the roofs were of solid silver. Other historians, both sacred and profane, speak of its great abundance, and some of them are so liberal in the use of adjectives, as to lead to the suspicion that they were in no wise trammelled by existing facts. Oriental exaggeration has no doubt something to do with their stories.

At the present day, in certain parts of the East, a statement is rarely made exactly as it should be, according to Western notions. Thus a man, describing a fine house, would not convey a proper idea of its character if he described it exactly as it is. If he should say that the house covered a square mile in area, was half a mile high, contained two thousand rooms, each of them so full of furniture that nobody could get inside the door, and that the household consisted of nine hundred servants, he would merely convey to his hearers the impression that the house was somewhat above the common order of houses, and nothing more.

Bayard Taylor, in one of his books, describes an interview with a certain prince or titled individual from one of the interior kingdoms of Africa. The prince, in describing the wealth and resources of the kingdom of Dahomey, said that the king never walked out unless accompanied by at least ten thousand attendants, and that when he chose to ride, forty thousand horses were led to the door of his palace, from which he could make his selection. He continued in the same strain, and when he had finished his story, he asked

a question in regard to Mr. Taylor's country. Mr. Taylor replied, that the United States were so large that it took two years to travel from one end of the country to the other; that it required six weeks of rapid riding to go round the walls of the capital; and that our Sultan, who was called the President, had a wardrobe of sixty thousand coats, from which he made his selection to dress himself for breakfast. In this manner each person conveyed to the other the proper idea of the country, and nothing more. The prince substantially informed the American that Dahomey was a rich country, and the king powerful; while the American, on the other hand, informed the prince that America was a very large country, and that the president's wealth was personal, rather than national.

But we are getting away from silver, a substance which it is not desirable at any time to see far from us.

The locality of the ancient silver mines is buried in obscurity; but it is known that silver was obtained, together with gold, from various parts of Africa, and also from Asia. The Spanish silver mines were developed at a very early period, and were the basis of the extensive commerce which Spain conducted for a long time with other countries. Hannibal is said to have opened a mine which furnished three hundred pounds of silver daily, and was worked by horizontal tunnels extending a mile and a half into a mountain. During the middle ages the production of silver fell off very greatly, and until the fifteenth century comparatively little silver mining was carried on. The production of Spanish mines was greatly decreased, and the wealth of Spain fell off in a proportionate degree.

Rich mines of silver existed in the new world, particularly in Mexico and Peru. The conquest of Mexico by Cortes in 1519 was speedily followed by the development of the rich silver mines of that country. From a very early period the Aztecs had been familiar with silver, and wrought it into many ornamental and useful articles. The mines were opened and extensively worked by the Peruvians in Guanajuato, Zacatecas, and other districts, and their production was greatly

increased by the abundance of quicksilver, and its employment in the reduction of ores. Quicksilver is used for this purpose to a greater extent in Mexico and Peru than in other countries.

At the time of the visit of Humboldt in the early part of this century, it was estimated that three thousand distinct mines were in operation. The greatest of all the mines of Mexico are those of Guanajuato and Zacatecas. They were opened in 1558, upon the great vein known as Veta Madre. The great vein is chiefly in clay slate. It is of wonderful thickness, sometimes more than one hundred and fifty feet across, and is said to have been traced for about twelve miles.

The vein is made up of half a dozen substances, the most important of which are native silver, sulphuret of silver, and red silver. Near the surface they are partly decomposed, but in their unchanged condition, farther down, they are known as "black ores." The vein has been penetrated downward more than two thousand feet, and is found to be very rich at that depth. The mine of Valenciana, upon a rich portion of this vein, has averaged at times a product of two million dollars, or about one fifteenth part of the total product of all the mines of Mexico. At the present time no work is carried on in these mines. Operations were suspended some years ago by floods of water, and the unsettled state of the country, added to other disadvantages, prevented a renewal of work. Before any productive operations could be prosecuted, it would be necessary to erect powerful machinery; and to set it up and put it in operation would cost enormously; so great, in fact, would be the cost, as to deter any body of men, or any association of capitalists, from entering upon the enterprise.

Until the present century the ores of the silver mines of Mexico have been worked by rude processes, very little in advance of those of the native Indians. Little or no mining machinery was used. The ores had to be transported out of the mines upon the backs of Indians, climbing up a series of long steps over slippery rocks, and working in a nude state.

When the mines were troubled with water, rude pumps were set up, and in many cases there were no pumps, but the water was carried out on the backs of men.

A traveller who visited one of these mines, where operations on a small scale were going on, says the sight of the men carrying their burdens, some laden with ore, and some with water, formed a curious picture. The ore was carried in sacks or baskets slung across the shoulders of the men, while the water was carried in pig-skins. These skins were in the natural shape of the animal, and were supposed to have been removed without cutting. When slung over the shoulders of the men in the dim light of the mine, the man and the pig clinging to his back appeared to form a single animal. An unsophisticated traveller, who accompanied the narrator, was curious to ascertain how the skins were obtained in that condition, as the ordinary mode of skinning pigs, oxen, or any other beasts requires a liberal use of the knife. He was informed that the animal was starved for several days, so that his skin became quite loose. Then a stout cord was tied to his tail, and by this mode he was securely fastened to a tree. A potato or an ear of corn was then held a few feet in front of his nose, and the pig was finally coaxed out of his skin, and induced to walk away from it. The man seemed to have his doubts as to the truth of the statement, but finally concluded to accept it as correct.

In 1821 the Mexican government offered facilities for foreigners to become interested with the natives in the mines. Several English companies were formed, and operations were undertaken upon a new system, in order to work the mines with powerful machinery, and with all the advantages of capital and mining skill. In nearly every instance these operations were unsuccessful, partly owing to the enormous expenses attending the management of a silver mine in Mexico, and partly owing to the dishonesty of the natives in official and private capacities. Whenever a mine yielded handsomely, the government surrounded it with absurd restrictions, or old titles were discovered to it, that made the claims of the new occupant valueless.

ENTRANCE TO A SILVER MINE OF CENTRAL AMERICA.

INDIAN SILVER MINERS AT WORK.

The English capitalists and gentlemen who went to Mexico were worried and wearied out in a few years, and returned with unpleasant recollections.

At the present day nearly every foreigner who visits Mexico to engage in a business enterprise has very nearly the same story to tell. The instability of the government naturally leads to insecurity, both to life and property; and where the property is that of a foreigner, it is not very likely to be regarded with great respect.

From the opening of the Mexican mines, in the sixteenth century, their production of silver has exceeded that of all other countries. From the annual yield of two or three millions of dollars, it rose, in the eighteenth century, to twenty millions, and continued so for about ten years of the present century, when it was changed by the war of independence. It remained at a low rate until 1850, when it again increased, and in 1856 it was not far from forty millions.

Latterly, as already stated, the product has been greatly diminished, and accurate statistics are very difficult to be obtained in regard to it.

The total product of the Mexican mines from the time of the conquest by Cortes up to the expulsion of the Spanish in 1827, is said, according to official records, to have been considerably more than two thousand millions of dollars. The silver mines of Northern Mexico, near the boundary of the United States, are supposed to be very rich; but the disturbed state of the country prevented their successful exploitation.

Mining operations to some extent have been carried on in some of these districts, and in Arizona, but under many disadvantages.

Arizona is a delightful country in every respect, except in climate, soil, production, and inhabitants. The natives have a pleasant way of slaughtering every stranger who attempts to stay there; and sometimes, when they refrain from their amusement for a few months, the strangers fall to killing each other.

Until very recently it was said that no white man had ever

died in Arizona with his boots off, — meaning that he had never died in bed. The cemeteries at two or three settlements in Arizona are said to contain no graves except those of persons who had died violent deaths at the hands of either white men or Indians. The Indians make travelling very insecure; and the Peons, or native Mexican laborers, in the mines vary the monotony of their employment by an occasional massacre of the superintendent and every other white man about the place. I was at one time acquainted with a superintendent who had twice escaped assassination by reason of accidental absence. He did not take warning by his luck on these occasions, but continued on in his usual way till on the occurrence of another conspiracy he was killed.

Closely rivalling the mines of Mexico are those of Peru. They are scattered in various parts of the country, but the richest and most famous are in Potosi, formerly belonging to Peru, but now a part of Bolivia. The story is, that these mines were discovered in 1545, by an Indian hunter, who accidentally exposed lumps of the precious metal in the roots of a bush which he pulled from the ground. His discovery led to careful and extensive explorations, and in a short time the city of Potosi sprang up in a barren and almost inaccessible district.

Potosi is among mountains generally of volcanic formation, and more than five thousand mines have been opened in its vicinity. The country is barren, and much of it is more than ten thousand feet above the level of the sea.

The city of Potosi is more than two miles up in the air; that is to say, more than two miles above the sea level. It has a population at the present day of less than fifty thousand, though it contained at one period more than three times that number. It has been repeatedly shaken by earthquakes, and in some of these earthquakes a great many people have lost their lives. All supplies must be brought from a distance, as the country in the immediate neighborhood produces absolutely nothing.

It is not a beautiful place of residence, and those who

dwelt there are almost entirely devoted to the production and preparation of silver.

An idea of the richness of the mines may be formed, when it is known that between 1556 and 1800 the mines of Potosi alone yielded nine hundred and twenty-five million dollars' worth of silver.

Silver mines are pretty much alike in all parts of the world. They are also not much unlike mines of other metals. They are opened by shafts, tunnels, and the like, the same as other mines, though each locality has some processes of operations peculiar to itself. The ordinary methods of separating silver from its ores are based either upon forming an amalgam of the metal with the mercury, or in bringing it into combination with lead, and afterwards separating it. The ores of Mexico and Peru are treated by both processes. Some of the richest ores are picked out and thrown into the furnace. The amalgamating process, which was long used in the silver mines of Mexico and Peru, and is still generally practised there, was invented more than three hundred years ago. The ores are crushed by stamping machines, and then ground with water, in machines called *arastras*, a sort of circular mill, run by mule power. It is ground to as fine a condition as possible, and, after being allowed several days to dry, is spread out in circular heaps, about fifty feet in diameter and a foot in depth. To every ton of this substance three bushels of salt are added, and the whole is then carefully mixed. A chemical substance, of a coppery character, is then added, and a sort of fermentation takes place, in which great heat is thrown out. Quick-silver is then added, in small quantities at a time, and crudely mixed in, until the whole mass forms an amalgam. The whole process occupies from four to six weeks. The amalgam is then separated from the mass of ore by a system of washing similar to that practised in collecting gold. The mercury is then separated from the amalgam by the ordinary process of evaporation, and in the same manner as if removing it from gold.

Sometimes silver is found in masses which are nearly pure ;

but this is very rarely the case. The largest quantities have been discovered in the copper mines of Lake Superior, and in some of the mines of Norway and Saxony. Some of these masses exceed five hundred pounds in weight, but ordinarily they weigh but a few ounces or pounds.

Specimens of native silver are frequently found in the beds of rivers, very far from any other deposits of this metal. The richest mines of this metal, at the present day, are in the United States, particularly in Nevada and Utah. The great Comstock lode has already been referred to. In November, 1859, the discovery of silver mines at Lake Washoe became known, and in the following year the products of the mines were sent out in such large quantities as to lead many people to suppose that the commercial value of silver would be greatly cheapened.

Mines have been opened in various localities throughout Nevada, but the richest of them, and, in fact, almost the only ones, of any great value, are on the Comstock lode. Its ores are very rich. The vein is of unusual width, and it has made fortunes for a great many men, and, on the other hand, has taken fortunes from a great many others. Some of the most extensive mining speculations ever known in California have been in these mines. Their value has greatly fluctuated; in some years the product has exceeded twenty millions of dollars, and the price of shares in the mines increased accordingly; then the product would suddenly fall off, and down would go the stock. Sometimes dividends would be made every month, and suddenly they would be followed by left-handed dividends, or assessments. In San Francisco a single day has witnessed the reduction to beggary of men who at sunrise could boast of considerable wealth; the following day might witness their return to wealth, or the return of others to poverty. Nearly all the men who made money in Nevada ten years ago, and did not kill themselves by riotous living, are now poor, and have a brilliant prospect of remaining so.

**ONE METHOD OF WASHING FOR SILVER.**

**ANOTHER METHOD OF WASHING FOR SILVER.**

## XLIX.

### THE GAMBLING HELLS OF GERMANY.\*

THE FOUR GREAT SPAS. — DESCRIPTION OF BADEN, HOMBURG, WIESBADEN, AND EMS. — ROULETTE AND ROUGE-ET-NOIR. — SPLENDOR OF THE SALOONS. — THE PERSONS WHO FREQUENT THEM. — PROFITS AND PECULIARITIES OF THE DIRECTION. — THE PHILOSOPHY OF GAMBLING. — WHY PLAYERS LOSE. — STRANGE SUPERSTITION OF BETTORS. — THE INVALIDS. — DROLL SCENES AT THE PUMP-ROOM. — THE MAN WITH A SNAKE IN HIS STOMACH. — THE ROBUST HYPOCHONDRIAC.

The best known and the most popular of all the fashionable and gambling watering-places in Europe are Baden-Baden, Homburg, Wiesbaden, and Ems.

The first, a town of some seven thousand inhabitants, is delightfully situated in a valley of the Black Forest, on a small stream known as the Oehlbach, eighteen miles from Carlsruhe, in the Grand Duchy of Baden. Homburg von der Hohe, having a population of about five thousand, is the capital of the Landgraviate of Hesse-Homburg, and may be considered a suburb of Frankfort on the Maine, as it is only nine miles from that city. Wiesbaden, fourteen miles west of Frankfort, contains nearly twenty-five thousand people, and is the capital of the Duchy of Nassau. This pleasant city is on the Salzbach, an affluent of the Rhine, and at the foot of the delightful Taunus Mountains, its situation and climate being almost identical with those of Homburg. Ems, often called Bad-Ems, is a hamlet on the Lahn, fifteen miles north of Wiesbaden. It is also in Nassau; is shut in by hills, has

\* The gambling spas of Germany, but not those of other countries, have been closed since Chapters XLIX. and L. were written; but the chapters have been left in their original form, as the present is a better tense for description than the past.

a pleasant terrace along the river, and is surrounded by delightful scenery.

Though all these spas, or baths, as they are styled, are in Germany, they are visited during the season, extending from May to October, by invalids and pleasure-seekers from every civilized country. July and August are the most fashionable months, and then the springs are frequented by French, Spaniards, Dutch, English, and Americans, as well as Germans. The principal patrons, independent of the home population, are from France, England, and our own country, albeit almost every nationality under the sun is represented at those centres of folly and dissipation. I have seen Turks and Armenians at Baden, Greeks and Persians at Homburg, Egyptians and East Indians at Wiesbaden, and Mongols and Arabians at Ems.

Baden (it is called Baden-Baden to distinguish it from other places of the same name) is the most fashionable of the four resorts, and cannot be surpassed for the beauty of its scenery. The picturesque heights rising above the valley, the ruins of the old castle overlooking it, the magnificent views, the pleasant drives, handsome villas, and charming walks in the neighborhood, with the agreeable and varied society, render it remarkably inviting. The number of strangers annually flocking to Baden is from fifty to sixty thousand, and these, especially in midsummer, crowd the hotels and countless boarding-houses to overflowing.

Homburg within the past ten years has also become very fashionable, and counts its summer visitors by the tens of thousands. It lacks the pictorial quality of Baden, but its atmosphere is reputed to be extremely salubrious, and its society is delightful, of course. Being so near Frankfort, many persons, particularly those in delicate health, reside there all the year round, and many of the Franforters have their residences at the springs.

Wiesbaden, even more than Homburg, is the home of the denizens of the old German capital, and by reason of its larger population, has greater attractions than the rival

watering-place. A large number of retired bankers and merchants from various parts of the Continent have villas at Wiesbaden, and every year the number increases.

Ems has had, and still has, the reputation of being patronized extensively by crowned heads and the nobility; but the prosperous and pleasure-loving generally are hieing to the banks of the Lahn more and more every season, and making its society more agreeable and democratic at the same time. The annual attendance is much less than at any of the other three springs, but they who go to Ems claim that the quality of its visitors more than compensates for any want of quantity.

The four German spas are on the whole very much alike, barring topical features. They each claim great antiquity in regard to the fame of their waters, holding, and upon good grounds, that the old Romans found vast benefit in the healing virtues of the baths. For generations they were frequented only by invalids, but of late years gayety and enjoyment have been the object of the majority of their patrons. The gambling, it must be confessed, has been, and is still, the chief attraction; not so much because all the visitors wish to play themselves, but they like to see others play, and to be part of the great variety of people whom the tables draw to the different spas. Since the gambling has ceased, as it did last year (1872), the German watering-places have lost much of their allurements, and the thousands who used to go there will be represented by hundreds merely. What is considered wickedness has unquestionably its spice and charm for the average mind, and a certain departure from the customary and conventional creates a species of magnetism.

The games at the baths are *roulette* and *rouge-et-noir*, frequently called *trente-et-quarante*. The smallest stake allowed at *roulette* is a florin (about fifty cents) and at *rouge-et-noir* two florins. The largest bet that can be made at the former is four thousand florins, and the largest bet that can be made at the latter game is five thousand six hundred florins. The capital at the *roulette* table is thirty thousand francs (six

thousand dollars), and at *rouge-et-noir* one hundred and fifty thousand francs (thirty thousand dollars). When this sum is won by any of the bettors, the bank is declared broken, and the table is closed for the day, but is re-opened on the day following for all to test still further their good or ill luck. Newspaper correspondents are constantly writing about the breaking of the bank at Baden or Homburg, depending, as many such writers do, upon their imagination for their facts. The truth is, the bank is very seldom broken, — sometimes not more than once or twice during the whole season, — and when it is, it almost invariably wins back from the fortunate player all, and much more than he has gained.

The gambling saloons are in large and splendid buildings, beautifully frescoed and gilded in the interior, and luxuriously furnished. They are called the *Conversationshaus*, the *Cur-saal* or *Curhaus*, containing, in addition to the gambling tables, spacious apartments for reading, dining, dancing, and lounging. The tables are thronged during the height of the season by elegantly dressed men and women of divers nationalities. They are presided over by the banker, — so he is styled, — who receives and pays out the money, and keeps general watch over the game, and by several croupiers, who with a little rake, draw in or push out the stakes as they are won or lost by the bank. During July and August, the gaming saloons, in which there are generally six or eight roulette or *rouge-et-noir* tables, present a brilliant spectacle. Anybody may enter, if he be respectably dressed and well-mannered, though he must leave his cane or umbrella with the lackeys in the vestibule, remove his hat, and refrain from speaking above a whisper. Why the Goddess of Chance should be entitled to the homage of silence may seem singular; but when it is remembered that all gamblers, while engaged at play, are exceedingly nervous, and therefore morbidly sensitive, it is plain enough why the strictest order and quiet should be carefully preserved.

The spectacle, I have said, is brilliant; and indeed it is. The saloons are adorned like palaces; immense mirrors, in deep

CONVERSATIONHAUS AT BADEN.

CONCERT IN THE GARDENS AT BADEN.

gilt frames, are upon the walls; rich silk and lace curtains depend from the windows; gorgeous chandeliers diffuse their radiance; velvet sofas invite to rest, and the clink of gold tempts to hazard. About the tables are gathered young and lovely women, richly dressed, from the cities of the old world and the new, and men in fashionable attire, representing various ranks, professions, and callings. There are dowager duchesses from England, pretty countesses from France, fleshy baronesses from Germany, delicate maidens from America, lorettes from Paris, adventuresses from Naples, danseuses from Petersburg, and actresses from Vienna. Spanish grandees stand shoulder to shoulder with French communists, who fought like tigers for the possession of the French capital; Calabrian bandits, who have retired, independent, from the trade of throat-cutting, are in close contact with honest Holland burghers; Russian princes hand their stakes to professional blacklegs recently arrived from London; Swiss statesmen exchange nods with bankrupt gamblers; and Belgian chevaliers of industry smile, as they win, upon Teutonic philanthropists risking a few napoleons, simply for lack of something better to do.

The air of the players is entirely genteel, and their manners completely negative and subdued. Whether they are lucky or unlucky, would seem to make no difference to them; they give no outward sign; their faces are usually immovable, unless high breeding, as it is commonly understood, prompts them to look cheerful when they lose, and melancholy when they win.

The slightest disturbance is very rare in the saloons. I have been in them, day after day, without noticing the least departure from order, or the smallest violation of conventional courtesy. Occasionally, some undisciplined man manifests his nervousness and excitement outwardly, when, if the stony stare or facial disapproval of those about him does not chill him back to conventional bearing, the lackeys, always in attendance, induce him to carry his demonstrations into the open air.

The impression obtained from the saloons by a new comer

is, that all the habitués are amiable, insouciant, comfortable, and prosperous. He would never suspect that, behind all this fair comedy, lurks the sombre spirit of tragedy; that the serenest faces mask an aching mind, and that the softest smiles hide, but do not help, a breaking heart. Nowhere under the sun is social masquerading more skilful and complete than in the German temples of chance. Everything is so smooth, so decorous, so delicate, so nicely adjusted, that one who seeks for inner contrasts must seem like a cynic and an iconoclast. To him who can believe in appearances, Wiesbaden and Ems are the most satisfactory places of sojourn. They express the essence of formal conventionality, and the rounded relation between unexceptionable raiment and unexceptionable manners. They point to the promised land of adaptation, and predict the millennium of mode.

There have ever been, and there ever will be, any number of persons foolish enough to think they can break the bank, if they will only watch the game closely, and profit by the favor of fortune. It is this delusion which sends, year after year, so many victims to the Conversationshaus and Cursaal, and keeps up the faith of the victims, even after they have been ruined again and again.

The gaming saloons are governed and regulated by a stock company, under the name of the Direction, which is the closest of close corporations. It is eminently impersonal too, nobody knowing the names of, or, indeed anything about, its members. Of course, its stock, like that of some of our gas companies and banks in New York, is not to be had, and is never quoted. The directors pay a license to the petty governments under which the tables are kept, and which are largely sustained thereby. The license varies materially. At Baden it is about seventy-five thousand dollars a year, and the Direction, in addition thereto, pays all the expenses of the Conversationshaus, whatever is required for the preservation and improvement of the adjoining grounds and gardens, and makes many other outlays, which must increase the total sum to fully one hundred and fifty thousand dollars. At Homburg

the license is some fifty thousand dollars, and, moreover, the Direction of the Cursaal lights the little town, keeps it in good condition, supports its hospital and other charitable institutions. At Ems and Wiesbaden, the government tax—for that is what the license really is—is about sixty thousand dollars for the former, and forty thousand dollars for the latter place.

The capital of the Direction is set down at from two million to one million five hundred thousand dollars, though I seriously question if much more than one tenth of the sum has ever been paid in. The tables usually clear from two hundred and fifty thousand to five hundred thousand dollars annually; the profits being larger, of course, at Baden than at Ems, and varying with the season, and the luck of the bank. Not long ago, the Homburg bank was broken five times during the year, and yet the Direction, even then, declared a dividend, it is said, of nearly twenty-five per cent. on their capital. The income from the stocks of the German gambling companies is reputed to be enormous, and I have met men in many foreign countries who were credited by rumor with owning such shares. They had no visible means of support, and still they lived luxuriously, even prodigally, merely because they had had the good fortune to secure a small amount of stock in the Cursaal or Curhaus.

The limitations and the percentage at *roulette* and *rouge-et noir* are seldom taken sufficiently into account by the *galerie*, as the bettors are named. Those, in the long run, will beat anybody and everybody, whatever run of luck they may have now and then. The games are based on an ultimate certainty, almost mathematical, in favor of the bank, and the prevalent notion that the players can have any permanent advantage is simply absurd. The chances on the side of the bank are so many, that, in a given time, it must inevitably win, and win largely. All the systems by which the *galerie* expect to triumph are utterly false and deceptive. They have done more, by a certain speciousness, to lead men to their ruin, than anything connected with the passion for haz-

ard. They invariably fail, because of the limitations in bets, and the percentage in favor of the tables; but the advocate of the system very seldom reckons upon these great drawbacks. This class of men believe that will happen which they wish to have happen, and are therefore incapable of clear perception of anything opposed to their theories and desires.

The one adverse fact, above any other, to bettors generally is, that they very seldom, if ever, play as recklessly when they are winning as when they are losing. The reason is that, in the latter circumstances, they are endeavoring to win back their stakes, and are consequently in more or less desperate mood; while in the former case they are satisfied with what comes to them, and not tempted constantly to augment their bets for the sake of getting even. Irrational and ridiculous as it appears, there certainly seems to be such a thing as a run of luck, good or ill. We have all experienced this many times, albeit we may express the phrase in other words. On certain days things go wrong with us, and on certain other days they flow smoothly and prosperously, though we are wholly unconscious, on any of the days, of doing aught except our best to accomplish desired results. Sitting down to a game of whist in the evening, we find we cannot get a good hand, shuffle or change the cards as we may. The next evening, or the next morning, high cards and trumps come to us at every deal, as if some good genius had arranged the deal for us. What is this but a run of luck? In gambling, as every gambler knows, men are constantly having such runs. Whatever card or color you lay your stake on is almost sure to win to-day, and to-morrow almost as sure to lose. When you are fortunate, you make your ventures with at least a moderate degree of prudence. When you are unfortunate, your only thought is to get back the money you have parted with, and you keep doubling your stakes in the hope of achieving your purpose, instead of quitting the table, as you ought, when you plainly discover that fate is against you; or, in other words, that some mysterious and incomprehensible influence thwarts your every purpose.

Such inexplicable agencies or influences render gamesters superstitious. Having seen the tribe in almost every part of the world, I have always found them more or less tinctured with superstition. No amount of facts or arguments will drive it out of them, for by long indulgence it has grown to be next to an instinct. They have implicit faith in luck of every kind—in lucky days, lucky circumstances, lucky persons, lucky influences. Sometimes they will not bet themselves, but will ask others to bet for them. Something occurs in the morning which they interpret as a warning, and for the remainder of the twenty-four hours they will not touch a card or lay a wager. At the German baths this peculiarity is frequently observed. A man in luck is pestered to bet for others, and is offered a percentage if he will do so. This or that person is regarded as unlucky, and a patron of the green cloth will not stand on the same side of the table with him. A passing cloud, a chance-dropped phrase, a change of position, or any one of a thousand nethings, will induce a professional gamester to make, or prevent him from making, risks, concerning which he has ordinarily no prejudice. The folly of play is much surpassed by the folly of players, who become so permeated with fancies, theories, and fanaticisms, that on the subject they are specially interested in they are positively monomaniacs. I have talked with old habitués of Homberg and Wiesbaden respecting chances, coincidences, and systems, until I have discovered that long attendance on and close watching of the treacherous tables had absolutely turned their brains. They thought they were the shrewdest and most sagacious of mortals, and pitied me supremely, because I happened to have a little common sense in regard to *roulette* and *rouge-et-noir*, and because I would not believe that mere chance should be treated as if it were a positive science.

No one can form any adequate conception of the mental vagaries, bordering upon lunacy, of professional gamesters, until he has spent several seasons at the German spas, and become intimately acquainted with the men and women composing the *galerie*. Their entire conduct is regulated by a desire

to obtain luck. They strive to propitiate fortune, as if it were, as the ancients believed, a personal agency, subject to unaccountable whims and caprices. Many of their acts of charity are done not so much from benevolence as from a notion that it will influence favorably the issues of the games to which they are so wedded. This is true not only of gamblers abroad, but of gamblers everywhere. As a rule, they are far from intellectual, and hence superstition meets with little resisting power when it has once begun to encroach upon their understanding.

There are not only different classes of players, but players from different motives. The object of the majority is merely mercenary: they frequent the tables only to win money; they make hazard a business, foolishly hoping to reduce it to something like a rule. Other habitués of the springs bet for excitement, as they drink wine and seek adventures. They are not avaricious. When they win largely, they spend freely; and at the end of every season, whatever their success, they are much behind the game. The members of the third order are sufferers from ennui, and regard *roulette* and *rouge-et-noir* simply as a pastime. They have formed the habit of playing, and cannot break it. Their stakes are small, generally; but they are devoted to the tables, sitting there from eleven in the morning to eleven at night,—the fixed time for the perilous sport,—and frequently do not win twenty florins a week. A number of persons play because it is the fashion, though they do not continue it long, for the same reason. The game proves so magnetic that they either feel it a duty to abandon it altogether, or they are drawn into it, and are very soon too weak to resist its fascinations.

Very many, who have begun in the spirit of imitation, have grown to be confirmed gamblers. One of the most infatuated players I have ever known was a Spaniard, who went to Homburg to get rid of the rheumatism, and who, after three seasons of abstinence, put down a single napoleon, simply because he did not wish to seem odd. The risking of that little coin has since cost him a small fortune; and if he were to live

a thousand years, — as he told me himself, — he could not be near *rouge-et-noir* without taking part in it.

America, or rather the United States, is more puritanic than other countries. Gambling is regarded here quite differently from what it is in Europe. Even our transpontine cousins, the English, are much more addicted than we to play. They never have social whist parties without betting at least enough to create an interest. The Germans, unless in prosperous circumstances, are preserved from the habit of gambling by their constitutional economy and thrift. The Latin nations have a natural fondness for whatever turns upon chance. Of these people, the Spaniards enjoy gambling most, and the French least, while the Italians are but little behind the Spaniards in this particular. It is safe to say that all three, hearing the spinning of the *roulette* wheel, and the clinking of coin at *rouge et-noir*, could not long be kept from the seductive tables. The Russians — those who travel, at least — love the green cloth, and figure prominently among its devotees. Most of them have money, and are such ardent pleasure-seekers, at the same time possessed of something like an American, vanity for spending and making display, that they rarely fail to participate in any dissipation which offers.

It must not be supposed that all the frequenters of the spas indulge in play; for many of them go there for recreation, and merely look at the games. Then, as I have remarked, thousands visit the springs for the benefit of the waters. That they have medical virtues cannot be well questioned, after one is told, as I have been told, of extraordinary cures by those who have been sufferers. Ordinarily, a casual visitor, who rises late, sees very little of the invalids; but if he has a liking for early morning air, and bends his steps towards the pump-room (*Trinkhalle*), he will encounter men and women afflicted with every variety of disease. He will observe them also on their way to and from the baths, — young and old, dark and fair, rich and poor, handsome and homely, cultivated and coarse, graceful and awkward, — all in quest of the invaluable boon, which we never appreciate until it has slipped away.

There is something melancholy, as well as grotesque, in the moving panorama of the distempered. They walk with canes and crutches, are carried in invalid chairs or wagons, and look so wan and rueful that I have often felt prompted to apostrophize health as the sum of all blessings. There are young and fair women, fragile from their birth, for whom there is not an atom of hope, and who yet believe they may find some miraculous cure in the baths for lack of constitution, and for inherited disease. The *bon vivant*, peevish and irritable from the gout, limps along, and the overworked man of brains, paralyzed on one side, is wheeled over the pavement by the stupid lackey, unconscious that he is the possessor of nerves or a stomach. The dyspeptic — of course an American — glowers on everybody as he passes, but appears to hate no one as much as himself. After having fancied himself cursed with every disease, and after consulting physicians of the highest grade on both sides of the Atlantic, he has come to Ems to test the virtue of the baths. They have done him no good, for he will not be prudent either in his diet or his habits; and he will go home with his mind made up that all medicinal springs are humbugs. He is unaware that the cause of his ailment is dyspepsia, and that it has gotten into his mind. On Monday, he thinks he has consumption; on Tuesday, he fancies it is liver complaint; on Wednesday, he is sure his kidneys are deranged; on Thursday, no one can convince him that he is not suffering from enlargement of the heart; on Friday, he declares he has the marasmus; on Saturday, he swears nothing was the matter with him originally, but that the infernal physicians have poisoned him; and on Sunday, he contemplates suicide as a means of relief. The poor man is the victim of bad cooking, for which our country is famous, and his excessive haste in eating. If he had been born in France, and taken his meals at the Paris restaurants, he would be to-day one of the most contented, instead of the most miserable of men. Talk as we may, digestion is the foundation of human happiness, and will keep us on good terms with ourselves when an unsullied conscience and troops of friends are of no avail.

Hypochondriacs are to be met at the celebrated baths, of course; for wherever there are disordered bodies there are disordered minds. No human creature is so ill as he or she who imagines an illness, since the subtlest art of healing cannot reach the shadows of emptiness. I remember an Englishman at Homburg, one of the most robust of fellows, who, after quitting college, had begun reading medical works only to convince himself that he had some deep-seated disease. His belief stimulated his appetite for information. He pored over all the pathological treatises he could find, and every week fancied that he had some new ailment. He travelled everywhere, swallowed entire drug stores, visited every watering-place in civilization. He had been nearly twenty years in pursuit of the health he had never lost, when I made his acquaintance at the Quatre Saisons. Happening to touch on the subject of hygiene, I set him off upon countless theories, and upon the bitterest denunciation of physicians. He informed me confidentially that he had a serpent in his stomach, and that he felt it every day gnawing his vitals. He felt sure that he had swallowed it in an embryo state, years before, in India, and that he would never be well until the reptile was by some means expelled. He was a man of ruddy complexion, and of nearly two hundred pounds avoirdupois, which induced me to tell him that serpents must agree with him, and that, if he could swallow four or five more, he would live a thousand years. He assured me he could not be mistaken, and that he had hope that the water of a certain spring would insure his recovery. After tasting of that particular spring, I expressed my conviction that no well-regulated snake would endure being deluged by such an obnoxious liquid day after day, and that his frequent draughts, without any result, proved conclusively that the reptile was in his mind, and not in his stomach. This style of bantering seemed to please him, and when I made it clear to him that I was not a professional physician, he was willing to follow my advice. I urged him to give up doctors and medicines of every sort; to take a great deal of exercise, and to cease thinking of himself

as a valetudinarian. He promised to follow my prescription for six months, and the ensuing winter I met him again in Naples, a radically changed man. He had cleared his brain of all its cobwebs, and thanked me heartily for the sagacious course I had recommended. "I am delighted to know," he added, "that you are not a physician, for if you were, you couldn't help being a fool."

The stout women on the shady side of life who visit the springs under the impression that they are ailing are extremely amusing. They must know they are shams; but they imagine that it is genteel and attractive to be delicate; and so, notwithstanding their excellent appetite and liberal proportions, they insist they are going into decline, when their chief danger is from apoplexy. They will entertain you by the hour with their lack of appetite, their loss of sleep, and their extreme fragility. You may credit their story unless you happen to see them at dinner, or hear them sleeping audibly on the sofa soon after, or find them performing social duties which would tire out Samson.

## L.

### GAMING AND GAMESTERS ABROAD.

FOREIGN AND DOMESTIC SUMMER RESORTS. — THE ADVANTAGE OF THE FORMER. — MYSTERIOUS CHARACTERS. — A TRIO OF CELEBRATED GAMESTERS. — THEIR EXTRAORDINARY HISTORY. — TRAGIC FATE OF A YOUNG RUSSIAN OFFICER. — TEMPTATION, DESPAIR, AND SUICIDE OF A BEAUTIFUL ENGLISH GIRL. — A LUCKY BANKER'S CLERK. — A HUNGARIAN HANGING HIMSELF FOR A WARNING. — ECCENTRICITIES OF CROUPIERS. — A CALM-BLOODED HOLLANDER. — THE SKELETON IN THE CLOSET. — ROSE-STREWN ROADS TO RUIN.

FOR mere recreation and pleasure the foreign watering-places have great advantages over those at home. Saratoga cannot be compared to Baden any more than Long Branch to Biarritz. The promenades and promenaders beyond the sea have far more pleasantness and variety; the scenery is more picturesque, and the general comfort and satisfaction immeasurably greater. There is much less of that desire of one to outdo the other, much less feverish unrest, much less ambition and anxiety for display. Each person lives according to his or her means; has no heart-burnings or envy on account of people in more fortunate circumstances. The gardens of the spas are delightful, and when the bands play, as they do at stated intervals, and the fountains flash in the sunbeams or the moonlight, and the gay throng passes to and fro, and easy prattle is interspersed with merriment and laughter, all the externals for enjoyment are furnished. The promenades, like the gaming saloons, are as a gay masquerade. On them and in them are men and women of every grade, and they all mingle together, though without recognition, as a well-dressed and well-bred democracy. Balls and concerts are given every week; and these, with dining, and wining,

and driving, and flirting, and the countless follies and jollities of fashionable life, make the season pass swiftly in one round of delicate dissipation and refined revelry. Such extremes and excesses as we have are not observable there. The social tone is more elegant, although a fairer outside may conceal darker and deeper depths. To an observer and student of human nature, the German spas are certainly more attractive and retentive than our own summer resorts. They do not weary you after a few days, or weeks at most, but draw you back to them year after year with a freshness of flavor and the spice of a new zest.

This continuity of charm is shown by the large number of regular habitués which each of the four springs has. I have met at Baden and Wiesbaden elderly couples who had been coming there since their early marriage, and who regarded the places and the play as indispensable to their contentment. You see there, season after season, mysterious characters that you never see anywhere else, — men apparently wealthy, with fine manners and a grand air, who, for aught you know to the contrary, may be pirates or highwaymen. Eccentric women flock there, too, about whom there are endless rumors, but no authentic information. They may be duchesses or demi-mondists, actresses or adventuresses, leaders of the ton or ladies of the sidewalk. So long as they conduct themselves properly, no one cares to inquire who they are or whence they come. The atmosphere of the Taunus and the Black Forest is free, and not a taint of Puritanism is in it. They whose position is fixed are so much assured thereof that they do not fear any passing wind which may blow between them and their nobility.

One of the oldest known frequenters of Homburg is the Countess Kisselef, the former wife of the Russian minister to Rome. She was never missed a season for forty years, and recently she has been a permanent resident of the little capital. She must be seventy now ; is so broken in health, and infirm of body, that she is forced to hobble about with a cane and a crutch. Age and debility have not, however, lessened

GAMBLING SALOON AT BADEN.

her passion for roulette, the only game she plays. Her passion for it is ineradicable, and the story is, that her husband long ago separated from her because she would not give up gambling, to which she devoted the greater part of her income. Having married her, it is said, for her fortune, — originally several millions of roubles, — he was angry that she should risk at the tables what he wished to use for himself. Her losses are reported to have been immense, — I have heard them estimated at a million and a half of dollars, — and yet she has quite enough left to enable her to bet freely in the Cursaal. Her gray hair, aquiline nose, sharp chin, and large and crippled figure are familiar to everybody. She is usually one of the first persons seated at the table, and some minutes before eleven o'clock you may see her helped into the room by the lackeys, or some of her own servants. She occupies a particular chair, and she is always in it, except when she goes to dinner and to sleep; taking no rest even on Sunday, when the game is generally more animated than on any other day.

The countess is very much attached to Homburg, where she has put up many handsome buildings, opened several new streets, and in many ways contributed to its improvement. Exceedingly homely as she is now, — she reminds me of a feminine grenadier wounded in different campaigns, — she is reputed to have been beautiful once, and to have been a fascinating and dangerous coquette. Such tales are told of nearly all women known in society who are noticeably ugly and obese. I can't believe that the Countess Kisselef could ever have been charming. I should sooner expect her to break the bank at Homburg ten times a day in her present old age, than think it possible for her to have broken a masculine heart in all the freshness of her youth. A woman of her form and feature might be formidable as a foe, but never perilous as a friend. The aged countess has had her obituary written several times, but she was still alive, and still watching the ivory ball, the last season, and will be, I am sure, for many seasons to come. [The gambling tables were closed

last year because the license expired with 1872, and the countess can hardly survive. Roulette has so long been her sustenance that she must perish if deprived of it for many seasons.]

The Princess Suvarroff, also a Russian, is one of the notabilities of Baden. Her career, if report be true, must have been eventful. A native of Siberia, she went to St. Petersburg while very young, and her father occupying a high position in the army, she was received into the best society, and, by her beauty, grace, and accomplishments, soon became the centre of a large and admiring circle. She had lovers by the dozen; and although many men of rank sued for her hand, she refused every offer, declaring she preferred freedom to the highest title and the largest income. At last the Czar, wishing to perpetuate the name of Suvarroff, then dependent on a single scion, — the prince of that name, — urgently requested that she should take the prince for a husband. The imperial request is equivalent to a command, and the charming flirt, unwilling to forfeit the favor of the court, consented, even with the knowledge that her husband would be her husband only in name. She has since had several children; and though their paternity is not easily traceable, they are called Suvarroffs, and the object of the Czar is therefore attained. The princess has had, and still has, all the liberty she could desire. She goes where she chooses, and does what she likes. Baden is her favorite resort, and *rouge-et-noir* her favorite pastime. She has been remarkably successful in her ventures, being one of the very few players who have won more than they have lost. Her reputation for luck has long been established, and the consequence is, she is perpetually asked to place the money of others upon the green cloth, which she often does, as she is extremely good-natured and obliging. Considerably over forty now, she is still handsome, and her ease and grace of manner, with her richness of attire, indifference to conventionality, and brilliancy of conversation, render her noticeable at all times and in all places.

Señor Garcia, one of the most renowned of Continental gamesters, and one of the lions of the spas, died very recently in Geneva, bankrupt in hope and fortune. He was born at Saragossa, of a good Spanish family, and inherited large wealth at his maturity. This he wasted in dissipation, materially assisted by his fondness for *trente-et-quarante*. He afterwards inherited some twenty thousand francs by the death of a relative in France, and, with this as a stake, he won nearly two millions of dollars. For several years he lived luxuriously, driving the finest of horses, wearing the rarest of diamonds, giving the superbest of dinners. His turnouts were conspicuous in all the capitals of Europe, and, though he spent money like Fortunatus, there seemed to be no end to his wealth. No one in this generation has broken the bank of Baden so often, and *tailleurs at rouge-et-noir* really feared him, so unprecedented had been his successes. His luck deserted him at last, and he lost in the Conversationshaus the last florin he had been able to borrow.

He then went to Monaco, and became a waiter at a fashionable restaurant; but whenever he had a few francs in his purse, he laid them on the table which had swallowed up his riches. His lofty air in the restaurant at Monaco first directed my attention to him, and caused the remark that he had the manners of a prince in the person of a servant. Informed of his antecedents, I no longer wondered that his appearance was above his station. He was a great favorite of the patrons of the establishment where he was employed, and the gratuities bestowed upon him were large and frequent. He received them, I remember, as if it were a condescension on his part, and as if the givers ought to be eternally grateful to him for his generous acceptance. He made numerous efforts to propitiate the goddess who had deserted him, but she was as obdurate as a woman whose vanity had been wounded. After various shifts, he breathed his last in miserable lodgings, leaving behind him but twenty sous as a mournful memento of his dangerous vice and his once splendid fortune. The close of his career conveys its

own moral. He died as most gamblers die, whatever may have been their occasional prosperity — baffled in his desires, robbed of his gains, derided by destiny.

Garcia had more philosophy than many gamblers have. They who lose everything, after having been for a certain time successful, are often so deeply distressed by their changed condition that they commit suicide.

Self-destruction is something the virtuous Direction has a holy horror of, for it clearly illustrates the natural result of gambling, and has a tendency to discourage timid persons from betting liberally. The Direction doesn't care a maravedi, of course, how many men hang or women poison themselves, after being ruined at *roulette* or *rouge-et-noir*, if they will only be obliging enough to die privately, instead of in the face of the public. Every once in a while, some man, whose last stake the *croupier* has raked in, steps into the beautiful gardens in the rear of the gambling saloons, and blows out his brains, because he believes that an empty purse is more to be dreaded than an occupied coffin.

Two or three years ago, a young Russian officer, a member of a highly influential family, came to Wiesbaden to spend the summer. He had never touched a card, — indeed, he did not know one from another, — and was enjoying himself very well with the pleasant acquaintances he had made there, when an Italian lady, who had been unlucky, asked him, one day, in the Cursaal, to bet a few napoleons for her. She had faith, inasmuch as he was entirely unfamiliar with gambling of any sort, that he might turn the tide of her fortune. He was too gallant to refuse, and, as it happened, he won for her in less than half an hour two hundred napoleons, without understanding a single rule of the game. He then asked her if she was satisfied, and she replied in the affirmative. He quitted the saloon, determined never to play on his own account. He misunderstood himself. He passed a feverish and restless night, and in the morning he was drawn irresistibly to the tables. If he could have such good fortune for another, why should he not have it for himself? He was

haunted at once by visions of wealth, and he no longer had the power to resist the tempter.

The young officer took his place at the table, and did not rise from his chair until eleven o'clock that night — the regular hour of closing. He was then ahead of the game nearly one thousand dollars, and the demon of avarice was fully aroused in his soul. Another feverish and restless night, and again the morning found him at his post. For several days he played with varying success, and at the end of a fortnight he had lost all he had, and had drawn the last franc from his bankers in Paris. He then borrowed a considerable sum from his friends at Baden, and that went with the rest. Excitement, and the unusual quantity of wine he had drank, had maddened him. His sole thought and desire was to get more money for play.

In a moment of weakness and frenzy, he forged the name of a wealthy cousin in Moscow upon a bank in St. Petersburg, and asked an acquaintance, to whom he had brought letters of introduction, to cash it for accommodation. The request was granted as soon as made. The Russian hurried to the Conversationshaus, confident that he would win enough to take up the draft, which he had expressed a desire that his friend would hold for a day or two, as he might in the meantime receive a remittance from his father.

The fates were hostile. When the officer laid his wager on black, the red won; and when he trusted the red, the black triumphed.

In three hours the entire amount of the draft had melted away. Ruin stared him in the face, — not only financial ruin, but ruin to his good name, his honor, his self-esteem, which he had prized more than life itself. Hopeful as he had been, he had prepared himself for such a desperate emergency. He had a small Deringer pistol in his pocket, and rising from the table, and stepping back two or three paces, he put it closely to his heart, and pulled the trigger.

The *galerie*, intent on the game, did not notice his movement and the first intimation it had of anything unusual was

the report of the weapon and the heavy fall of the officer on the floor. The ruined gamester gasped twice or thrice, and his life went out with the blood that crimsoned his bosom.

The players — some of them, at least — were startled for a moment; several of the ladies shrieked, and one, an American, swooned. The *tailleur* and the *croupiers* looked on unmoved, and expressed some surprise that the young man had not been polite enough to step into the garden before shooting himself. The *tailleur* announced that the game would be suspended for half an hour. In that time the body was removed, the blood washed away, and the eternal *Faites votre jeu, messieurs; le jeu est fait; rien ne va plus*, was croaked out once more; the cards were laid, and the coin pushed over, or raked in by the solemnly silent *croupier*.

Women, with the retiring modesty that belongs to their sex, seldom make an exhibition of themselves, even when they are the heroines of their own tragedy.

At Ems, recently, a young English lady of family became engaged to a gentleman in her own grade of life, who could not bear the idea of women gambling. She had been at the baths for several seasons with her father; had frequently staked money at the tables, and had formed a strong attachment thereto. Her father was aware that she played sometimes for amusement, but never suspected how much of a fascination the game had for her. Unknown to him, she had pawned her jewels to obtain money to hazard at *rouge-et-noir*.

After her engagement, her lover told her how much he was shocked to see any members of her sex degrade themselves by gaming, and added that, much as he cherished her, he would rather behold her dead than receiving a fortune from the hands of a *croupier*. Deeply impressed by the earnestness of his words, she resolved never again to take any part in the dangerous excitement. For weeks she adhered to her resolution; but, one evening, while strolling through the Curhaus, she so far forgot herself as to venture a napoleon, and, winning that, to venture and to lose twenty

more. For three days she continued to bet secretly, and at the end of the time felt convinced the passion was too strong to be surrendered. Such self-knowledge was terrible indeed, and so deep was her mental distress that she determined to live no longer. Purchasing a vial of laudanum, she went to her own room, and writing a letter to her affianced husband, in which she made a full confession of what she had done, and of the unendurable misery her conduct had caused her, she swallowed the poison, and was found, the next morning, dead in her bed. Her affianced lover was overwhelmed with sorrow, and protested that he should never more know an hour's peace.

This proved to be only masculine hyperbole, for he was married two years after, and appeared, judging by outward signs, one of the most contented and self-satisfied of men.

All this perilous wooing of fortune does not always lead to tragedy. A young man, residing in Frankfort, who had only his salary as a banker's clerk to live upon, fell in love with a prosperous merchant's daughter, and his attachment was fully reciprocated. The rich papa, as commonly happens, was unwilling to have a poor son-in-law, and so refused his consent point blank to the union. Entreaties were vain; his daughter's tears moved him not a whit. He informed the young man that he would give him three years to achieve pecuniary independence in, and if he did not succeed, he must, at the end of that period, abandon all hope of the girl's hand. In America fortunes are suddenly made; but in Germany, where everything runs in grooves, there is hardly a possibility of earning much money, unaided by capital or powerful influence. For twenty-four months Romeo struggled for his prize, but struggled in vain. He had succeeded in saving only about five hundred dollars; and, knowing this would be considered a contemptible sum by the merchant, he felt that he would be forced to give up all claim to the woman he adored.

Falling asleep, one night, with this subject upon his mind, he dreamed of going to Homburg and increasing his little

store tenfold. On awakening, he considered his dream prophetic. He visited Homburg, placed his all upon "color" again and again, and each time "color" won. His five hundred dollars he increased to ten thousand; returned to Franfort; procured papa's consent; married the girl, and, as the story goes, has never since been known to risk a florin on a game of chance. So even gambling, great evil as it is, sometimes does good, though instances like this are extremely rare.

A Hungarian merchant from Pesth came to a melancholy end at Baden, a few years ago. He had been to London on business, and on his way home thought he would spend some days at the baths, where a number of his friends were staying. He had scarcely arrived there when he began at *rouge-et-noir* with a few florins, not having the least intention of playing largely. Like hundreds of others before him, he was drawn into the dangerous rapids before he was well aware of it. He lost not only the money he had with him, but drew on his own firm, obtained advances on his letters of credit, and at the end of a week was absolutely ruined. He had a wife and six children at home, and had not the moral courage to apprise them that they were beggars, to make a resolution never to play more, and commence life anew. Wishing, however, that his fate might be a warning to others, he went late at night to the promenade in front of the Conversationshaus, and when the little town was quiet and asleep, he placed a large placard upon his breast and hanged himself before the main entrance to the beautiful building. The placard, written in French, ran thus:—

"Here am I, a Victim of Gambling!  
Take Warning by me, and never Enter this Hell!  
The Man who Plays Damns his Soul Forever!  
Don't Deceive Yourself! Bet Once, and You are Lost!  
The Doors of this Saloon are the Gates of Death."

The bathers and water-drinkers, sallying forth early, were shocked to see the unfortunate gentleman suspended by the

neck, and to read what he had so truthfully written. The Direction, indignant at what they considered a breach of etiquette, lost no time in removing the corpse, which furnished such a sad commentary on their perfidious entertainment. Before breakfast everybody knew of the tragedy, and it had such an effect upon the patrons of the bank that the tables, for two or three days, were very thinly attended. The Direction felt sorely troubled respecting the unpleasant circumstance, as they termed it, and industriously circulated the report that there was no truth in the story of the Hungarian suicide; that he had really left for Basle the day previous to his reported self-destruction; that the figure found hanging was merely an effigy placed there by some mischievous jesters, against whom legal proceedings would be begun forthwith. Strangely enough, this invention was believed. The players returned in full force, and the warning of the Hungarian was lost, as a thousand other warnings have been lost before.

If the private history of the four gaming places could be learned, with all the evils resulting from them, the record would be ghastly and hideous indeed. It is only now and then that an intimation of the great injury they do comes to the surface; and if any considerable part of it were known, the springs would be avoided like lazar-houses. A stoical pride is generally practised by the habitués who have suffered financially; and I have observed many men, and not a few women, turn away from the tables with a forced smile, when I knew that they were undergoing excruciating torture.

Losing money which one cannot afford to lose brings with it a train of social, mental, and moral ills that cannot be fully estimated. Could a thousandth part of the woes wrought by the demon of chance be depicted on those frescoed and gilded walls, they would equal the torments ascribed by gloomy priests to the doomed and damned in the fiery pit.

The outside of the temples of fortune is dazzlingly attractive; but, passing beyond the portals, and lifting the purple

veil, such anguish and agony are apparent as may well appall the stoutest heart.

Some men are so methodical and cool-blooded that they are proof against the seductions of *roulette* and *rouge-et-noir*. They can make up their mind beforehand as to how much they will lose, and never risk another florin. These, however, are exceptions to human nature, and no ordinary mortal can hope to imitate them with any prospect of success.

A sturdy Dutch banker from Amsterdam is in the habit of visiting one of the spas every season, and always bets within a certain limit. Four thousand florins is the sum he feels able to lose annually, and this being gone, nothing prompts him to risk any more. Sometimes he loses this in a few days, sometimes not for weeks, sometimes not at all. Whatever he may gain does not count, as he feels privileged to do as he chooses with his winnings, but having parted at the tables with four thousand florins less than he had on his arrival, he is bidden in vain to make his game. He told me once that he fancied he was a good deal ahead of the tables, but having made an exact calculation, he found that in ten years all he had won was fifteen florins.

The *croupiers* are a singular class. Nearly all of them have, some time or other, belonged to the *galerie*, and, as may be imagined from their position, have wrecked themselves on the uncertain sea of hazard.

The last season I was at Homburg, six of the *croupiers* there had histories. One of them was the son of a coffee planter of Brazil. He had fallen into some serious trouble in Rio Janeiro, and had gone to Lisbon, where he led such a prodigal life, and drew on his father so frequently, that the old gentleman refused to honor his drafts further. The young scapegrace then went to Italy, served in the Papal army, afterwards became a sailor, travelled all through the Orient, earned considerable money by trading, went back to the Continent, visited Baden, arrayed himself against the tables, was rendered penniless, and in his desperate strait was appointed *croupier*.

A second of this fraternity had been a Malay pirate, it was whispered, and also a monk in Palermo; then a *valet de place*, and finally a brother of the rake.

The third informed me he had been a Greek priest, but, having been suspected of conspiring against the Emperor of Russia, he was sent to Siberia, whence he escaped and entered upon his present calling.

A fourth, a Hebrew, once kept a pawnbroking shop in Chatham Street, and was sentenced to Sing Sing on a charge of forgery, served two years, inherited some money left him by an uncle in Prague, became a victim to play, and at last had the satisfaction of getting on the right side of the table.

The fifth *croupier*, a Frenchman, had emigrated to California in 1849, and, as a member of the sporting fraternity, narrowly escaped hanging by a mob, some years after. Floating from point to point, he stranded at Baden, and will doubtless die there.

The sixth began his career as a reporter on a Berlin journal; served in the Prussian army; studied law, medicine, and theology, but could never practise anything save gambling. "I always lose," he said to me; "and having no more money to risk, I have the satisfaction now of seeing other persons make as great fools of themselves as I have made myself."

Hundreds of chapters might be written on the gambling hells of Germany, for the subject is inexhaustible. But each and all of them, if truthful, would show that the spas, like the Dead Sea apples, are attractive to the sight, but ashes and bitterness within. The players are handsome maskers. They laugh, and dance, and seem happy; but when the masks and dominos are removed, the bodies are leprous, their touch contagion, their soft caress a lingering and loathsome death.

### SUBTERRANEAN DWELLINGS.

**EARLIEST HABITATIONS. — UNDERGROUND HOUSES. — A DWELLING ON THE AMERICAN PLAINS. — HOW AN EARTH HOUSE IS MADE. — RESULT OF A NIGHT IN IT. — ARCTIC DWELLINGS. — A MANSION IN KAMCHATKA. — ITS ADVANTAGES AND DISADVANTAGES. — A CHIMNEY AND DOORWAY IN COMMON. — THE AUTHOR'S EXPERIENCE. — A LIVE DOG IN A STEW-KETTLE. — THE STORY OF GAMOOT. — HOW HE ENTERTAINED HIS FRIENDS. — FISH-OIL PUNCH AND A CANDLE BREAKFAST. — HOW HE LEARNED ENGLISH. — NEW MODE OF BOXING THE COMPASS. — GAMOOT'S MELANCHOLY FATE.**

THE climate of the Garden of Eden was of such a temperature, and the customs of Adam and Eve, before their famous fruit-gathering excursion, were of such a primitive character, that no dwellings were needed. It is not known that the weather ever compelled Adam and Eve to seek shelter, and they had no prying neighbors to disturb them; but, after the abandonment of the garden, it became necessary for them and their followers to have places of shelter. The first habitations were, probably, holes in the ground. The historians generally agree that the primitive habitations of the savage partake more or less of a subterranean character. At the present day there are many tribes of people that live wholly or partially under ground. Dwellings thus made are easy of construction, especially in regions where timber is not abundant, and the facilities for working in stone do not abound.

In the far west, between the Mississippi River and the Rocky Mountains, there are many underground, or partly underground, dwellings, inhabited, not by savages, but by white men. Dwellings of this sort are not particularly dry, but they are generally cool, and, if one does not mind a little

ESKIMAUX DWELLING.

dampness, they are quite comfortable. My first experience with one of these habitations was not entirely agreeable. I had been travelling for several days, and sleeping at night under the shelter of a wagon. My bed was airy, and the only protection the wagon gave me was to keep away the dew, and prevent wandering mules and oxen from running over me. My health was excellent, and I was beginning to consider a house a superfluity.

We found a party of men living in one of these houses, where there was no wood for a long distance, or but very little of it, and they had dug out a place under ground, covered it with a roof consisting of poles, bushes, and turf, and were making themselves comfortable. They urged me to share their hospitality, and I did so, abandoning my wagon for the shelter of their roof. In the morning I awoke with one of the worst colds I ever had in my life, and for several days I had a very disagreeable and intimate acquaintance with a sore throat.

In the northern part of America and Asia the dwellings of the aboriginals are constructed partly under ground. A hole is dug in the earth four or five feet deep, and a rude roof of poles and earth is placed over it. The Greenlanders and the Esquimaux generally enter their dwellings by a long passage-way, so low that one must creep on his hands and knees, and it is so narrow that a stranger cannot easily turn round in it. In Kamchatka the natives have a similar dwelling. Some tribes enter their houses at the side by a passage-way, somewhat like the entrance to an Esquimaux dwelling. Other tribes enter through the centre of the roof, going down through a hole which serves for a chimney.

After an experience of both kinds of entrances, I greatly prefer the Esquimaux'. In North-eastern Siberia it was my fortune to be thrown among the Koraks, a people whose dwellings have only one place to serve as a door and chimney. The fire is directly beneath this hole. It is generally burning in winter with considerable briskness, and almost always has a pot of reindeer meat over it. When you accept

the hospitality of a Korak, you descend into this hole by means of a pole with notches in its side, on which you must cling with feet and hands. A blast of hot, blinding smoke rises in your face, and, as you descend, it grows hotter and hotter. By the time you are within two feet of the bottom, you can scarcely breathe. When you think you are nearing the bottom, you must jump from the pole, and you are just as likely to jump into the fire as you are to jump from it. At my first experience I did not jump fairly into the fire, but so close to it that my feet came very near being singed.

Every Korak habitation supports a large number of dogs, which are used for draught purposes. The dogs are not admitted to the private quarters of the family, but are compelled to stay outside. They content themselves with hanging round the hole in the roof, and look down in the inside, sniffing the venison that is below. Occasionally they get to fighting near the hole, and one of them drops through. Sometimes he drops into the fire, and sometimes into the pot of meat, and makes a commotion. He yells a good deal in either case. If he has fallen into the fire, he is taken by the neck and swung up again through the chimney. If he falls into the stew-pot, he is taken out, howling all the while like a congress of chimpanzees, the broth is squeezed out of his shaggy hide, so that it shall not be lost, and then he is thrown up into the open air. The natives do not appear to have any pity for the dog, and the fact that he has been soused in the dinner pot does not in the least affect their appetites. They swallow the stewed venison with just the same relish as they would if it contained no dog's hairs to thicken the mess and get between their teeth.

In these northern regions the weather is exceedingly cold. On the coast of the Arctic Ocean, far inside the polar circle, the sun frequently forgets itself, and for days and weeks in summer behaves like a masculine chicken, and never sets. In winter it also forgets itself, and not only sets, but stays set for a longer time than the most respectable hen that was ever known. It would be inconvenient to publish a daily news-

paper there, for the reason that some of the days are not more than fifteen minutes long, while others are three or four months. And the same is the case with the nights, which are sometimes stretched out to an inconvenient length. They would be jolly for courtships and for evening parties; but it would not be advisable, in the middle of one of the best of those nights, to sing "We won't go home till morning," and then fall to drinking hot punches and things every ten minutes, "till daylight doth appear."

Those long nights are a great delusion to a man who thinks it will be capital sport to lie abed until late in the morning. If he goes to bed with a determination to make a night of it, he finds that he does not sleep straight through, but has to get up a good many times before morning to have his hair dressed, and to get on the outside of that edible conglomerate known as hash. If he should try to get through the night without eating or drinking, the probabilities are that he would furnish a job for a hyperborean undertaker in consequence of early starvation; but it would be equally inconvenient to attempt to stay out of bed all day, as a great many people insist upon doing in this part of the world. A nap would be necessary after breakfast and after dinner, at all events, and I shrewdly suspect that the most of us, if we lived there, would have many breakfasts and dinners between sunrise and sunset.

It would delight John B. Gough or Father Mathew to have an old toper go away up north in summer, and take only one drink a day; and if he took it in the shape of an appetizer before breakfast, it would give him a splendid appetite by the time he sat down to his toast and steak, provided the day was laid out for only one allowance of breakfast, dinner, and supper.

In describing life in this region of ice, and snow, and underground dwellings, I propose to do it by narrating the adventures of a mythical native, whom I will call Gamoot. He owned a brown stone front, about latitude seventy-five degrees north, longitude two hundred and fifty degrees east, where his nearest neighbor was a polar bear, and he looked

out of his bay window upon a cheerful scene of icebergs, and all that sort of thing. His brown stone front was made of ice, built over a hole in the ground, and looked like one of the piles of hay that the farmers make in the field, before they drive round with the cart. The front door was a slab of ice, and, when you had rung the bell and sent up your card, you dropped on your hands and knees, and went in. The hall was twenty feet long, and about two feet high and wide ; it made a couple of turns, and one of them was a sharp angle, like the corner of a dry goods box. You went inside the house, and had to twist yourself round the corner of the hall, like a big steamboat going up the Red River. You had to work your way along very much as an eel goes through a water-pipe. Gamoot did not ventilate his hall very well, and if you were a new comer, it was quite possible for you to imagine that you had mistaken the entrance, and gone into the sewer instead of the fashionable doorway.

It was inconvenient sometimes, when you were about mid-way of the hall, creeping along ever so nice, and just doubling the sharp corner,—it was inconvenient, I say, to meet one of Gamoot's big dogs on his way out. Gamoot's dogs were an independent lot of pups, with appetites like mill-hoppers, and teeth like cross-cut saws. When they made up their minds to go out, they generally went, and if anybody was in the way, it was healthier for him to go ashore than to stay there. Gamoot used to apologize for his dogs, and say that their conduct was owing to their breeding, as they were half wolf and the rest ugliness. I used to wish that they had been of a different breed.

But if you happened to get into Gamoot's house without being interviewed by his dogs, you were sure to be interviewed by the whole family as soon as you reached the parlor. The *grand salon* was about twenty feet across, and was high enough to allow Gamoot to lie down, which he did very often. The only way you could stand erect was by sitting down on the floor, and standing in sections. By sitting down you could hold your head and body in a perpendicular posi-

tion, or by lying on your back you could stick up your feet and legs. The latter position was considered ungraceful, and was not generally practised by visitors. The house was ventilated through the hall, which was always kept closed. The atmosphere was about as thick as an invalid's gruel, and sometimes it became so tough and hard that visitors used to break off pieces of it to carry away as *souvenirs*. Gamoot had a pan which he used to fill with fish-oil, and then put a wick in it. This pan served as chandelier, furnace, and everything of the sort. Sometimes the children fell into it, but it did not burn them, though they soaked up a frightful lot of grease.

Sometimes, when Gamoot had company that he wanted to get rid of, he used to take a bottle out of doors, and fill it with fresh air. He would then return, and hold it to the nose of each visitor. He would then point to the cheerful hall-way; the two movements were understood to mean that there was more of the same sort outside, and that the visitors had better be sniffing it. The gentle hint was generally understood, and the visitor, after looking to see that the dogs were all inside, and not likely to be met in the hall, politely bade Gamoot adieu, kissed Mrs. Gamoot, the children, and the dogs, and departed.

Gamoot was as hospitable as a Dutch uncle. He used to keep a barrel of fish-oil and a box of candles on draught in one corner of his study and smoking-room. Whenever you called, he would mix you a fish-oil punch; and O, such a punch! It is enough to make one's mouth oil to think of it! Then he would hand you a candle, just as your Boston entertainer would hand you a cracker; and he not only handed you a candle, but he took one himself. It was a pleasure to see him, with a tin glass of oil punch in one hand and a candle in the other, and as fast as he took a sip at the candle, he took a bite at the punch; and it was not the polite thing to refuse either one or the other. Gamoot used to resent a refusal, and he had a pleasant way of taking you by the back of the neck, and squeezing you till your mouth opened.

Then he would drive the candle down your throat with a mallet that he kept for the purpose, and he would pour the punch after it with a funnel. Knowing his playful eccentricities, it was always better to take your punch and candle without making a fuss.

It may be inferred that Gamoot was an uncivilized savage ; but he was not. He had met white men who visited the polar regions in pursuit of whales. He had learned from these aristocrats something of the language and customs of civilization. He had no knowledge of sacred history ; but, to judge from the style of his speech, he was well versed in profane history. He knew most of the parts of speech in the English language that are addressed to disobedient sailors by their captains and first and second mates ; and on one occasion a shipwrecked mariner offered to educate Gamoot in English for his board and lodging. Gamoot accepted, and they went to work.

"I will teach the bloody Injin to box the compass," said the mariner to himself.

"Come here, blame your eyes !" said the mariner to Gamoot ; only he used another word, which I do not exactly recall, in place of "blame."

The mariner had saved a compass, and as Gamoot stood over it, Jack placed his finger on the "points," and named them over. But instead of giving their names as they are known to nautical sailors, he applied an oath to each of them ; and he varied the oaths, so that by the time the compass was boxed, he had uttered a lot of profanity that would make an Arkansas stage-driver break his heart for joy.

Gamoot was a good scholar, and learned his lesson well. He used to repeat it to visitors, and was as proud of it as a poodle dog is of the ribbons in his ears. He always gave great delight to the strangers, especially if they happened to be chaplains of whale-ships, or missionaries on the hunt for converts. To enter his house, take an oil punch and an appetizing candle, and hear his melodious voice box the compass in the way he had been taught, was a delight that few persons ever enjoyed.

But one day, when the bark Susan Maria touched near Gamoot's mansion for salt, water, and provisions, the hospitable gentleman went to the beach to welcome the crew, and look out for a chance to steal something. By accident he picked up an oar, and was walking off with it, for fear it might be lost. One of the sailors addressed Gamoot in language much like boxing the compass, and the innocent aboriginal supposed the briny navigator was repeating his lesson. The first mate, who had charge of the boat, repeated the address, and added something which implied that the dog-star presided at the birth of Gamoot. This phrase was also familiar to the native, and he paid no attention to it.

The mate then proceeded to give Gamoot a gentle hint, which he did by throwing a harpoon through him. The point of the instrument entered between the brown-skinned gentleman's shoulders, and came out in front of his heart, after dividing that organ into unequal parts. The boat-steerer then gave an additional hint by throwing a bomb-lance, which exploded in Gamoot's head, and interfered seriously with future repetitions of his lesson in navigation.

Gamoot subsequently died of his injuries. His romantic career has passed into poesy, and the story of his house, his punches, his candles, his linguistic researches, and his unfortunate harpooning is sung wherever he was known.

## LII.

### BRIGANDAGE AS A FINE ART.

HIGHWAY ROBBERY IN MODERN TIMES. — THE OLD WORLD AND THE NEW CONTRASTED. — HABITS OF RUSSIAN ROBBERS. — PIOUS THIEVES. — PRAYERS FOR SUCCESS. — ROAD AGENTS. — CRUELITIES OF ITALIAN BRIGANDS. — TORTURE AND RANSOM OF PRISONERS. — SPANISH BRIGANDS. — ADVENTURE ON A SPANISH ROAD. — AN AMERICAN PRINCE AND AN ENGLISH DUCHESS. — AN EXCITING RACE. — A DUCHESS IN UNDRESS.

BRIGANDAGE is rapidly becoming a thing of the past in most parts of Europe, thanks to the introduction of railways, and the gradual abolition of the mail coach and diligence. In France it occurs so rarely as to cause general comment whenever an instance is reported ; and in Prussia and Austria one can travel, with little danger of highway robbery, from one end of the country to the other. Russia, which has few railways, has more cases of brigandage than its western neighbors, though the government always deals very severely with robbers when it catches them. Travellers in the eastern and southern parts of the Muscovite empire frequently encounter robbers on their route, and give up their purses with as good grace as they can muster. There is a law in Russia that forbids one to fire upon robbers, unless they outnumber him three to one ; but as a man who is attacked can usually make conscientious oath that he thought his assailants very numerous, he is generally excused for any violation of the statute in such cases made and provided.

The land to which most of the Russian convicts are banished, Siberia, is, curiously enough, less dangerous for a traveller than the European possessions of the czar. In a land journey of five thousand miles, in Northern Asia, I was never

disturbed by footpads, and suffered no apprehension. Had my tour been in midsummer, there would have been less security; but as it occurred in winter, when the thermometer frequently reached forty degrees below zero, the circumstances were not favorable to lying in wait for several hours, when the prospect was good that the highwayman would freeze to death before he could find some one on whom to try his skill.

Of all European countries, Italy is the one at present whose sculpture, begging, painting, and highway robbery have attained the highest stage of perfection. In the southern part of the kingdom robberies are of frequent occurrence, and the mountains are full of bands, that have a regular organization for plundering travellers. Sometimes the scoundrels add murder to robbery, and they have a pleasant way of holding men for ransom. If the ransom money does not come as promptly as they desire, they detach a prisoner's ear, and send it as a gentle hint for his friends to hurry up. If the ransom is still delayed, the other ear follows, then a finger, and so on, until the unfortunate traveller is about as much his former self as Hamlet without Hamlet.

The Italian brigands are a pious lot of thieves, and when they set out on a marauding expedition, they generally offer up prayers for a successful result. Russian robbers are equally devout. There is a story of a Muscovite highwayman, who one day killed a traveller, and, while rifling his pockets, discovered a cake containing meat. Though very hungry, he could not eat the cake, as the church fast then prevailing forbade the use of meat. The King of Italy has made very earnest efforts to suppress brigandage in his dominions; but he has not succeeded, partly on account of the pope declining to coöperate with him as fully as he desires, and partly owing to the fondness of the inhabitants for a wild life. The Ex-King of Naples, who resided in Rome until quite recently, was well known to be in league with the brigands, whom he hoped at some time to make the nucleus of an army in case he should deem it prudent to endeavor to regain his throne. Men who

had been plundered on the roads of Southern Italy told me that they afterwards met their robbers on the Corso, or in the Piazza di Spagna, and saw them enter and leave the house of Ex-King Ferdinand.

The most prosperous parts of the United States, in the matter of brigandage, as elsewhere stated, are the new states and territories west of the Missouri River. In Montana, Idaho, Nevada, and California, highway robberies are frequent; and it is sometimes the custom for the stage companies to supply passengers with rifles for their protection. But the robbers generally take the opportunity to approach when least expected, and in many cases they do not trouble the passengers, but content themselves with the treasure in charge of the express messenger. Generally the messenger shows fight, if the driver does not, and in some instances the robbers have paid dearly for their attempt. They are well armed, and the passengers usually find it best to submit, and hand over their money without grumbling. The Californians speak of these robbers as "road agents," and I was much amused at the name the first time I heard it. I was starting from Stockton for Mariposa, and some one suggested, as I mounted to the outside of the coach, that the road agents might trouble us. I innocently asked if we were obliged to pay the tolls on the road, and suggested that the duty belonged to the company. There was a general laugh at my expense, as a fellow-passenger explained to me what a road agent was.

Spain can boast a fair allowance of brigands, though not as many as she could twenty years ago, on account of the construction of railways along the principal routes of travel. Probably the present troubles will leave the country in a very disordered condition, and for years to come there will be many men seeking their living by plundering others. The Spanish robbers are no less cruel than their Italian brethren, and they regard human life as of very little consequence. They do not hesitate to kill their victims when they think they will endanger their safety by leaving them alive. Mexico, Cuba, and the South American countries in general, copy

the customs of the people who colonized them, and especially in Mexico robbery is considered one of the fine arts. Many wealthy people are not exempt from the suspicion of having acquired their property by foul means ; and not unfrequently some of the high officers of the government are known to connive at the exploits of Mexican Jack Sheppards and Claude Duvals.

A few years ago a gentleman of my acquaintance had a curious adventure in Spain, which I will endeavor to relate in his own words. "I was travelling with my wife," said he, "and we had a long ride before us to Grenada. I found that two diligences were to start the next day, one of them quite new, and the other an old one. I engaged the *coupé* of the new diligence, paid for it, and was told to be ready at six o'clock the next morning. When I went there, I found that an English woman and her servant had installed themselves in our place, which they preferred to the old carriage, in which they had chartered the *coupé*. I protested ; but the woman cut me short with, 'I am the Duchess of —, and shall retain this carriage.'

" 'Ah,' I replied, bowing low, 'but I am the Prince Thomas of America, and my other titles are Boston, New York, Philadelphia, Chicago, and Salt Lake. We are all princes in America ; and, madam, my wife is the Countess of Michigan, Illinois, and Kentucky.'

"But the woman repeated her title, and refused to move. She did not care for an American prince ; and I was about to call the officials to eject her, when my wife said, in her hearing, 'If she is so unlady-like as to act in this way, we will leave her to herself, and ride in the old diligence.'

"The new vehicle moved off, bearing the English duchess, and we followed ten minutes later in the old one. About two miles from the starting-point, we passed the new carriage with a broken pole, and the driver and conductor were endeavoring to get another from a neighboring farm-house. As we passed them, I shouted to our postilion that I would give him a real for every mile he kept ahead of the other carriage,

and a dollar for every hour he arrived in advance of his usual time.

"He accepted the offer, and urged the horses to their best speed. Every time we changed, I distributed a few reals to the men about the stable; and I heard the postilion hint to them to make the changes as fast as possible, but to be in no hurry in supplying the other diligence. We went at a killing pace, and every time when we halted, the postilion said, 'You will owe me a great deal of money for this; you will owe me a great deal of money.'

"I found on calculation that I should owe him a very liberal gratuity, and assured him that I would pay everything I owed. As we passed through a certain wood, I observed that he watched the road-side very closely, and soon after repeated his remark about my indebtedness to him. I could not understand what he meant, but was wiser afterwards.

"We reached Grenada more than three hours ahead of time. There was then but one decent hotel in the place; and I knew that my duchess would be certain to go there, as it was not only the best hotel, but the point of arrival and departure of the diligence. The house was nearly full, and I engaged all the vacant rooms, paid a part of the money for them, and took a receipt. Two or three Spanish travellers arrived in the next hour, and I gave up some of my rooms to them, but enjoined the landlord under no circumstances to admit the duchess, or I would prosecute him for a violation of the contract.

"We dined, and took our ease in our room, and, after dinner was over, we watched for the other diligence, which was somewhat overdue.

"When it arrived, it was three hours behind the regular time, or six hours later than ourselves. The delay in consequence of the pole giving way had been more than an hour; but this was the least important mishap of the journey.

"The diligence had been robbed, and the brigands had done their work most thoroughly. They had an understanding with the drivers, whom they never disturbed, and ex-

ROBBERY OF THE DILIGENCE.

pected the diligence at the wood where my postilion looked around so anxiously. The rapid rate at which I was travelling in the old carriage took us past the haunts of the robbers an hour before we were expected, and thus I unwittingly saved myself from being plundered. It turned out that the frequent remark of the postilion, that I should owe him a great deal of money, referred to this little business of robbing more than to the fast driving. By following my desires in the matter of speed, he had saved me from an encounter with the brigands, who would have relieved me of all my spare cash, and of everything else of any value to them.

“As soon as I found how the matter stood, I sent for the fellow, who had been all the time loitering about the courtyard, and asked him how much he thought I owed him. He replied with the utmost dignity, though he could not suppress a smile, that he thought ten dollars, in addition to what I had given him, would be satisfactory. I paid with alacrity, and should have been equally satisfied had he asked five or ten times as much.

“The Duchess of — had been robbed about as much as she could be. The brigands were, no doubt, indignant that our diligence had escaped them, and determined to make complete work of the one they captured. They took her trunks from the carriage, and rifled them of everything they contained. They compelled my lady to hand over all her money and jewelry, and even stripped her of her travelling-dress, leaving her to finish her journey in her under-clothing. They offered her no indignities, and were as polite as could be expected under the circumstances. Not relishing the idea of arriving at the hotel dressed as she was, she had cut away the plush lining of the carriage, and hung it around her waist as a sort of skirt of a decidedly gaudy pattern. She was the most woe-begone picture I ever looked upon, and my heart relented when I saw into what a plight she had fallen. I had fully determined not to allow her to stop at the hotel; but when she arrived in utter destitution, I told the landlord to tell her that all the rooms had been taken by the American

prince, who was only too happy to accommodate an English duchess. She apologized for her rudeness in the morning, though she could not rid herself of her haughty demeanor.

“My wife supplied her with clothing enough to save her from inconvenience until she could communicate with the English consul. That gentleman did all in his power to aid his countrywoman, and, although he ran the risk of losing the money, he cashed her draft upon her bankers in Madrid. We left town before she did ; and I think she never after set up her privilege of rank to take possession of places that did not belong to her. I have always felt obliged to her for driving me into the old diligence, rousing my indignation, and leading me to be prodigal of my money in securing the highest speed, and thus escaping robbery.”

## LIII.

### ANIMALS UNDER GROUND.

HORSES IN MINES. — EFFECT OF AN EVEN TEMPERATURE ON HORSES AND MULES. — EFFECT OF DEPRIVATION OF LIGHT. — WALKING IN DARKNESS. — RATS IN MINES. — A MONKEY IN A SILVER MINE. — THE CONSTERNATION HE CREATED. — WHAT HE WAS SUPPOSED TO BE. — HIS UNHAPPY FATE. — A MONKEY AT SEA. — HIS PRANKS. — DEMOCRATIC HABITS. — HOW HE LOST HIS LIFE. — HIS LAST PERFORMANCE. — DOGS IN MINES, AND THE EFFECT OF UNDERGROUND CONFINEMENT. — JOY AT REACHING DAYLIGHT AGAIN. — TWO DOGS AT SEA, AND WHAT THEY DID. — A DOG SAILOR, AND WHAT HE DID. — HIS UNHAPPY END.

As a general thing, miners do not devote much of their time under ground to the care of pet animals. The horses and mules that are kept below are not regarded as pets, but as a part of the working force, and are required to do their whole duty. They are cared for just as well as animals of their kind in similar occupations above ground. Their stables are comfortable, and from their location the beasts can hardly be expected to suffer from cold, though they may sometimes find the heat rather severe. In many localities horses and mules that have been kept a long time under ground, in an unvarying temperature of seventy degrees or more, lose their hair, or a large portion of it. They never suffer from rain or snow, because there can be no storms hundreds or thousands of feet under ground; and they need no protection against cold where there is no cold. Sometimes they become blinded from constant deprivation of the light of day. They very soon learn to walk along certain ways and levels in complete darkness, though they manifest a decided preference for light rather than for its opposite.

The presence of rats in mines has been referred to elsewhere. In some mines they are rarely or never seen, while

in others they are numerous. The facilities for good living for rats are not abundant, and they certainly have small encouragement to stay in the levels and tunnels, when they might do much better, and live much happier, above ground. Generally they have no means of exit, as they cannot easily go out of the shaft; and the shaft is the only means of egress.

I once heard an amusing story of the consternation created in a mine by the introduction of a monkey. Somebody connected with the place had in a mysterious way become proprietor of a monkey, and one day he took the beast with him into the mine. The monkey made no objection to going there; but after reaching the tunnel where the men were at work, he became alarmed, and ran about very uncomfortably. He went from one place to another, attracted by the light, and in hopes of finding a friend. Many of the men had never seen a creature of his kind before; some thought it was the devil, as they could not imagine what else it could be, and some thought it an enormously overgrown rat.

One of the men was lying on his side, digging away at the base of a vein of coal. The monkey thought he recognized in this man a friend, or somebody who ought to be a friend, and went for him. The man knew nothing about the presence of the beast until the latter scrambled upon him and looked full in his face. The miner gave a scream, and fainted. Such a face had never before been turned towards his own, and his alarm was not at all surprising. The monkey left him, and then sprang among a group of men who were loading a car of coal. They stopped work, and shouted to their comrades that the devil was in the mine. In fact, within fifteen minutes that single animal had created an alarm among the men that was not quelled for two or three hours. The beast finally ran to the shaft, made a leap into the darkness, went down four hundred feet or more, and struck upon a pile of coal. As a monkey, he was not of much consequence after that.

Digressions are permissible in a popular work of this kind, and I take the liberty of giving a story of a monkey, which was told me quite recently by an eye-witness of his pranks.

"I was sailing as an ordinary seaman at one time on an American man-of-war. There were about five hundred men on board, and sometimes there was very little for us to do. Out in the East Indies, at one of the ports where we touched, we picked up a lot of monkeys. They belonged to the officers, but somehow the monkeys preferred to associate with the men. They had the free run of the whole ship, and did pretty much as they liked. They used to steal everything they could lay their hands on, and for a month or two the sailors had very little to do except playing with them.

"When we got out to sea, nearly all of the brutes died. We sailed up north in the Pacific Ocean, and it got rather cold. One monkey had brains enough to hunt out a warm place, and went down into the engine-room, where he used to sit and look at the stokers stirring up the fires. He would sit there, and make faces at them; and one of the officers said that the monkey, if he had any idea of a future state of existence, must imagine that he was in a sort of purgatory, and that the stokers stirring up the fire were keeping it hot for roasting a lot of fellows who were expected to arrive. He managed to live until we got back into the tropics again, and then he came out of his hiding-place, and used to go round among us as sociable as ever.

"He wasn't an aristocrat, that monkey, and didn't seem to have any high notions about society. One hour he would be in the cabin with the captain, and the next thing you would hear of him, he would be in the galley, making friends with the nigger cook. One day he took the cook's cap, carried it into the cabin, and put it on the captain's head. The captain did not like that sort of familiarity, and he ousted the beast from his cabin. He was constantly kicking up a row everywhere, but he was such an amusing duck that everybody liked him.

"When we were lying in the harbor of Nagasaki, we opened our gun-ports, just as we always did when at anchor. One of the favorite jumping-places of the monkey was to go from the end of a yard down to the port on the starboard bow,

and whenever they were chasing him, he would be sure to make in that direction. One day we got up steam, and prepared to leave; and of course our ports were then triced up. Just as we were starting, the monkey was full of play, and made for his favorite jump. He did not stop to see that the port was closed, and that in the place where he jumped there was nothing for him to light on; so down he went into the water. We threw a rope over the side of the ship, and he caught hold, and climbed up. He was always mighty careful after that about his jumping-place.

"Occasionally, when we were lying idle, and everybody was tired, the officers would get up a purse of five dollars, and then pipe the men to catch the monkey. The monkey would start up the rigging, and the men would go for him; and the first man that got him would have the money. You see, there would be over four hundred men in the rigging. The monkey could jump and run much better than they could, but they were so thick that almost everywhere he went he was in danger of lighting on a man. He seemed to enjoy the fun just as much as anybody else, and he would make a lively race all over the rigging. Sometimes he would go clear up to the main truck, and sit on the top. It was rather tough work to get him there, and it was no use climbing for him, because before a man could get hold of him he would be sure to jump somewhere else. So we had a rule, that when he got there, we tried to shake or frighten him off in some way; and if he was caught in that jump, the catch did not count.

"We had lots of fun that way. The officers would stay on the deck, and see the fun; and the men would do their best to catch the beast, as they knew that somebody would make five dollars out of the job. Every few days we had a race of this kind, but there came a time when we had the last one. The rule always had been that the monkey should not be hurt, but should be caught uninjured, and brought down.

One day the captain had his charts out, spread over the table in the cabin — his very best charts, and things that were

pretty important. He was studying them, and marking off his ship's course, and left them a few minutes, to go into his state-room. That infernal monkey was around, and as soon as the captain was gone, he jumped on the table, dipped his paw into the inkstand, and began marking out a course on the chart to suit himself. He daubed that chart all over with ink, and when the captain came out of his state-room, and found what had been done, he was about the maddest man you ever saw. He made a grab for the monkey, but of course the monkey got away. He struck out for the deck, and shinned up into the rigging.

"The captain came out without his cap, and was perfectly white with rage. We saw that something had happened, but what it was we did not know. We were steaming slowly along, and the men were scattered all about the deck.

"'Pipe all hands to catch the monkey!' said the captain. 'Ten dollars for anybody that gets him, dead or alive!'

"We knew there was business then, and we went for the monkey; and the monkey knew there was business too. He understood there was no time for fooling. I fancied that that monkey knew it was a race for life or death, and he never tried so hard before to keep out of our way. Every man who could be spared from the management of the ship was sent into the rigging. We chased him from mainmast to mizzenmast, and from bowsprit back to the stern. He went into all parts of the rigging, and had several narrow escapes.

"We were closing in on him, and had him in very tight quarters, when, all of a sudden, he played a trick which he had never tried before. He jumped to the top of the smoke-stack, and then to the steam-pipe, and there he sat. The smoke-stack was too hot for him, but the steam-pipe was cool and comfortable. Our ship, you know, was a low-pressure one, and we only used the steam-pipe when we let off steam, or had an excess of it.

"Of course nobody could shin up that steam-pipe, and there sat the monkey for at least a minute. While we were all wondering what to do, one of the boys went to the pipe, and

"...the string of the fog-whistle.

"Well, sir, there was a jet of steam, and that unfortunate monkey was blown up about twenty feet into the air, and came down on the deck, stone dead, with every hair singed off him. He looked just as if he had been through the barber's hands, and was preparing to go to church. The boy picked him up, carried him to the captain, and got his ten dollars. We did not have any more monkeys on the ship after that."

Pet dogs are sometimes kept in mines, but they soon lose their activity, and appear so unhappy that the miners, out of pity for them, take them to the open air again. I once saw a dog that had been kept a fortnight in a silver mine, without once seeing daylight. I happened to be at the entrance when he was brought to the surface, and never did I see a dog manifest more joy than did this one. As soon as he was placed on the ground, saw daylight, and snuffed the clear, open air, he ran about, jumping first upon one and then upon another of the miners, and seemed to thank them for his release from prison. He kept this up for a quarter of an hour, and then he darted about in wide circles, running at the very top of his speed, and paying no heed to anybody. He ran in this way until fairly exhausted, and then came up to his master, and lay down at his feet. His master then endeavored to coax him into the cage, to descend the shaft again, but the dog would not move. As his master stepped into the cage, he tried to call him down, but the dog turned, and ran away. He had had quite enough of underground life.

I have seen dogs that had been kept a long time on ship-board act in just the same way when going on land. Sailing once from San Francisco, across the Pacific Ocean, we picked up, just before our departure, two small dogs—one a Skye terrier, and the other a black and tan. For the first few days they were not in love with sea life, but before we had been a week on our voyage, they were accustomed to it, and wandered around the ship at will. They made friends with everybody. The black and tan had the run of the main cabin, but the Skye lived forward with the men. The two

dogs played together a great deal. The black and tan would go forward, and apparently invite the Skye aft. He would come, and they would play about the deck; but he never ventured into the cabin. He appeared to know his place, and kept it very carefully.

Twenty-four hours before we sighted land, when it was more than a hundred and fifty miles away, those dogs began to sniff the air uneasily, and rather wistfully indicated that they knew we were approaching shore, and that they wanted to get upon it. But when we entered harbor, they did not manifest any particular wish for the land; and though they looked around the deck, and off towards the shore, they showed no desire to seek it.

It was morning when we came to anchor, and we immediately made our official visits, and returned to the ship about noon. Opposite our anchoring-place there was a partially wooded point, which, we thought, would give us a pleasant promenade; and so, in the afternoon, four of us went ashore, taking the dogs with us.

They were reluctant to get into the boat, and the sailors were obliged to carry them down the gangway stairs to the boat, and put them ashore when we touched land. But as soon as they had touched it, and realized that they were on solid earth, they began to caper and run about in the most extravagant way. I think that before we had walked a mile those dogs had run at least ten miles, and had examined, in their canine way, every bush, and tree, and shrub in the region. Several dogs of ten times their size were wandering about, but these little brutes gave chase to them as readily as though the strangers had been rats. When they came back to our landing-place, they did not want to enter the boat, and we had to carry them in.

After that, whenever a boat went ashore, there was no occasion to invite the dogs or urge them to go. The very first instant they saw any preparations for leaving the ship, they would descend the gangway, and enter the boat; and if driven back, they would look wistfully over the side, and

sometimes fairly howl with sorrow. On two or three occasions, when we allowed them to descend to the foot of the gangway stairs, and pushed off without them, they jumped into the water, and followed us.

I may still further digress, and say, that on one occasion we had at sea with us a dog evidently born to a marine life. He was really attached to that ship, and apparently never cared to go ashore. If taken on shore by the captain or one of the officers, he would quite likely get lost; but he always knew enough to make his way back to the landing. If the ship was tied to the dock, he could select her from dozens of others. He never made a mistake, and never went aboard the wrong craft. At sea he would stand his watch as regularly as any one of the officers. When the starboard watch was called, he roused himself up, and went on deck. Sometimes, when he would be lying asleep, a call would be made for all hands, and he would be the first on deck. The rest of the crew, when called out, were generally obliged to put on some article of dress — at any rate, a hat, and possibly a coat; but Charley, as the dog was called, had no toilet to make, and consequently he would be the first at his post.

If he saw a man pulling at a line, he would seize it, and pull also; and sometimes, when there was no chance for him to pull at the line, he would seize the rear man by the seat of his trousers, and pull away for dear life. The men didn't like this sort of thing, as sometimes he included a little flesh in the folds of the trousers; and Charley got a good many threshings in consequence. But he was so anxious to do something, that within fifteen minutes after he was threshed, if he saw a line of men hauling in a rope which he could not get hold of, in would go his teeth into the trousers of the rear man, — and he had long and strong teeth too.

Every dog has his day, and Charley had his. As before stated, he could pick out his own craft among dozens of ships. If she was anchored from the shore, he would come down to the water's edge, give a look around, and discover the ship. Then he would strike boldly into the water, and swim towards

her. Somebody would see him, and a rope would be lowered, with a noose at the end. Charley would put his fore paws in the noose, seize the rope with his teeth, and be drawn on deck.

One day, when the ship was at anchor in the Bay of Panama, Charley started to swim out, as usual. The bay was full of sharks, and just as he had reached the side of the ship, and was putting his paws through the noose lowered to receive him, there was a swirl of the water. The head and belly of a large shark were visible for a moment, and with a single yelp of pain and terror, Charley was dragged under the water, and never seen again.

## LIV.

### MYSTERIES OF THE GRAND JURY.

SITTING ON A GRAND JURY. — HOW IT IS COMPOSED. — PECULIARITIES OF MODERN JUSTICE. — HOW TO SELECT BLOCKHEADS. — A DISHONEST BAGGAGE-MAN. — CHARITY AND MERCY. — AN AFFECTING INCIDENT. — SAVING A YOUTHFUL OFFENDER. — A GENEROUS WOMAN. — CURIOUS PHASES OF HUMAN NATURE. — CELT AND AFRICAN. — STORIES OF THE DETECTIVES. — A GARRULOUS IRISH WOMAN. — FAMILY TROUBLES. — THE HORSE AND CART STORY. — HOW A PRETTY WOMAN CAPTURED THE JURY.

It was the fortune or misfortune of the writer to be called to sit on the grand jury of the Court of General Sessions in New York, in the latter part of the year 1871. Like most of my fellow-men, I had no great fondness for jury duty, and made efforts to be released. I was politely informed that there was no escape, and that I had better do cheerfully what I could not avoid. And so I did it. I sat on that jury, or rather in a cane-seated chair in the jury-room, for fifty-eight days, some of them pretty long ones. It was my first experience of the sort, and I learned more about criminal matters than I had ever known before. A man who sits a month or two on a grand jury can have a reasonable excuse for accepting the doctrine of the total depravity of the human race, or, at all events, of a considerable portion of it.

What is the difference between a grand jury and a petit jury? To many persons, and probably to most, this question would be an insoluble riddle. Everybody who knows anything worth mentioning is aware that a petit jury, in a criminal court, consists of twelve men, who are sworn to well and truly judge of the guilt or innocence of the accused tried before them. They are to weigh the evidence given in open court in presence of the accused, and when they agree upon

(764)

a verdict, and are ready to return it, they stand and look upon the prisoner, who is instructed to stand and look upon them. To find a verdict, the twelve must be agreed; and thus it often happens that an obstinate man can "hang the jury," and prevent the rendition of a verdict. Obstinacy may arise from various causes and motives, generally honest, but not always so. Sometimes the jury is equally divided in opinion — six men being of one mind, and six of another; sometimes a verdict is the result of a compromise, which includes a recommendation to mercy, or a verdict for a lower degree of criminality than is charged in the indictment. In civil suits, where a question of damages or compensation arises, the result is often obtained by taking the figures proposed by each man, adding them together, and dividing the amount by twelve. But in criminal cases no such system of average can be employed. Very often the persistence of a single juror will save an offender from immediate punishment, and allow him a new trial — which frequently means no new trial, but a discharge on his own recognizance. And sometimes the obstinate juror attributes to his comrades the inability to find a verdict. The story of a western juror is frequently used to point a moral or adorn a tale. "I was all right," he says, "and we might have settled the thing straight off, if the other eleven hadn't been the most pig-headed fellows you ever saw."

One requirement of the practice in our courts is, that in a criminal case no member of a petit jury shall have formed an opinion as to the guilt or innocence of the accused. In cases that have not acquired notoriety, this does not materially interfere with the selection of a jury; but in a case that has attracted general attention, like that of Foster, or the assassins of President Lincoln, several days may be spent in finding twelve men without opinions. The rule was adopted long ago, when there was no general diffusion of knowledge, and when there was no daily chronicle of events accessible to everybody. On a matter of great importance and general newspaper discussion, it is next to impossible in these days that an intelligent man should have no knowledge or opinion;

to demand an opinionless jury in such a case is practically to demand a jury of blockheads. It may well be doubted whether, in this country of electric telegraphs and lightning presses, the old practice is the best. The object of trials by jury is to protect the innocent and punish the guilty. I think I utter the sentiment of most thinking men, in saying that for my part I would rather, if wrongfully accused of a crime, be tried before twelve honest, intelligent men, who believed me guilty, but whose opinion could be changed by evidence, than before twelve ignorant men who had formed no opinion about me. But if I were guilty, and desired, as most criminals desire, to escape justice, I should clamor for a jury of such of my fellow-men as could not entertain an idea without having it thrust into their heads with an auger. Many a scoundrel has evaded his just deserts by means of a jury of "twelve good men and true," whose intellects were hardly equal to those of an educated horse.

But a grand jury encounters none of the difficulties that beset a petit jury. The law requires that it shall be composed of "intelligent citizens of good character," who shall be qualified to serve as, and not exempt as, petit jurors. Their names are selected by lot, the same as employed for the selection of petit jurors, and each man selected is notified by the sheriff of the county. A grand jury is composed of sixteen as the minimum, and twenty-three as the maximum number. Twelve must concur to find a bill or to dismiss a complaint. No vote can be taken unless there are sixteen grand jurors present; whether there are sixteen or twenty-three present, or any number between the minimum and maximum, there must be, as before stated, twelve to concur in determining the ordering or rejection of an indictment. Other votes, such as for adjournment and the like, are taken by majorities, in the same way as in other deliberative bodies. The accused never appears before the grand jury, and only one witness can be called into the room at the same time. The district attorney may be present during an examination, and at the request of the foreman may conduct it, but he cannot be present when a vote is being taken.

The grand jury is of Saxon origin, and its existence may be traced as far back as the tenth century. Its object is one of inquiry rather than of trial, and for this reason it is frequently called a "grand inquest." Under the old practice the grand jury originated inquiry without the intervention of any public officer, and any citizen was at liberty to appear before it, state his own wrongs or the offences of others, or make complaints against public evils of any kind. It partook of the nature of a legislature or common council, to which any citizen may submit a petition. Any member of the grand jury who happened to know or learn of an infraction of the law could lay the matter before his associates for their action. I am informed by good legal authority that this is still the practice in England and in parts of the United States. But the practice of New York, so far as the city is concerned, has of late been for the grand jury to consider nothing that was not submitted to it by the district attorney, and for that official to submit nothing that had not reached him from a committing magistrate. There is both good and evil in the practice, and on the whole, much more evil than good. A great many offenders have gone unwhipped of justice in consequence of this system. Men who have just cause of complaint against other men high in power have sought in vain to bring their cases before a committing magistrate, for the reason that the latter was the friend or dependant of the accused, and would use his official position to protect him.

Several cases of this kind were brought to my notice while I was sitting on the grand jury. For example, a man one day came to me with a request that I would bring to the notice of the grand jury a certain case which he explained. I asked him why he did not go before a committing magistrate with it. "Why," he replied, "because the committing magistrates are all friends of this man, and would do anything he wants. He can get any kind of 'justice' he desires, and nobody can do anything against him." I am satisfied that his opinion of police magistrates in New York city was not altogether baseless, and, if I am not mistaken, other testimony could be found

to the same effect. With the reputation or lack of it that belongs to our local judiciary, it is eminently necessary that all grand juries should be clothed with the power that makes them grand in quests, and enables them to investigate any charge of wrong-doing without waiting for its submission by a police magistrate. I am satisfied that there are many scoundrels whose career of wickedness would be materially curtailed if they knew there was full opportunity for their accusers to go before a grand jury and furnish the proper information for a criminal indictment.

The testimony before a grand jury is of an *ex parte* character. Blackstone says, "They are only to hear evidence on behalf of the prosecution. For the finding of an indictment is only in the nature of an inquiry or accusation, which is afterwards to be tried and determined; and the grand jury are only to inquire upon their oaths whether there be sufficient cause to call upon the party to answer it. A grand jury, however, ought to be thoroughly persuaded of the truth of an indictment, so far as their evidence goes, and not to rest satisfied with remote probabilities — a doctrine that might be applied to very oppressive purposes." The petit jury gives the accused the opportunity to sift the *ex parte* evidence on which he has been indicted, and of explaining or contradicting it. The general rule for the guidance of a grand jury is, that they must be as well satisfied of the guilt of the accused, in order to find an indictment, as they would be to convict as petit jurors in case none of the evidence before them was explained or contradicted. It often happens that complaints are presented of an avaricious or malicious nature, or with some other motive than the proper enforcement of the law. Such cases require careful inquiry and cautious action.

Early in the session of the grand jury of which I was an integral part, a complaint was made against a baggage agent of a steamboat company for taking money for extra baggage, and neglecting to pay it over to the authorized agent of the company. At its commencement the case appeared reasonably clear, but a suspicion arose that the complaint was malicious,

and more evidence was called for. Each additional witness confirmed the suspicion, and it finally came out that the principal accuser had long desired the situation of the accused, and had been appointed to it after the removal of the latter. Here was a motive in which malice and avarice were evidently the principal elements, and when the matter was put to a vote the jury promptly dismissed the bill. The testimony of the complainant was not fully sustained by that of the other witnesses; and even had there been no display of malice, the evidence was not sufficient to secure conviction before a petit jury.

I wish to remark, *en passant*, that where I mention cases that were before us, without giving names and localities, I shall purposely, in most instances, change the story in such a way that the outside public cannot trace it, even with a careful research into the records of the police or other courts. My brother jurors will recognize each case described, but the veil of secrecy thrown around the grand jury room will not permit me to be rigidly precise. Great injustice might be done, in many instances, by a complete revelation, and therefore the reader must be left in the dark to a certain extent. He may look upon the cases I give him as exact parallels, and nothing more. When I say a man was charged with stealing a horse, you may know that he was charged with stealing something, but whether horse, cow, or cooking-stove, it is not necessary to explain in describing the work of the jury. And with this apology for harmless but very necessary fiction, I proceed.

It is not at all times proper to dismiss a complaint when caused by malice. One day a man came before us, who swore that another man had swindled a large establishment out of considerable money; he did not make the complaint on behalf of the parties defrauded, but in the interests of justice. His malice was evident; he made no attempt at concealing it; but he sustained his testimony with documentary evidence and the sworn statements of other witnesses. The jury doubted about the propriety of ordering an indictment

under the circumstances; some of them argued, that had no quarrel occurred between the parties, the case would have slumbered, and therefore the complaint should be dismissed. There was such a divergence of opinion that the district attorney was called to tell us what to do. We explained, through our foreman, the nature of the case. The district attorney, who is at all times the legal adviser and instructor of the grand jury, listened, and then said, substantially, --

"Where you find that a complainant is acting through malicious motives, and there are no other witnesses, or, if any, that they do not substantiate the complaint, you had better dismiss it. But where the complaint, however maliciously made, is shown by other evidence than that of the complainant to be true, you must order an indictment."

And consequently we ordered an indictment against the alleged swindler.

Not many days after we were convened, a case that touched the heart of every man in the room was brought before us. A young girl had been accused of theft; a few dollars in money had been stolen; it was found in her possession, and she had made partial confession. The complainant was a woman, and the accused had been in her employ. When the case was called, the woman entered the jury-room, and was sworn by the foreman. She took the chair assigned to witnesses, and the foreman questioned her.

"Did you lose some money?"

"Yes, sir."

"When did you lose it?"

"On the first day of December?"

"Who took it?"

"The girl named in the complaint."

"How do you know she took it?"

"I found it in her possession, and she confessed taking it."

"That will do; you can go."

But the woman kept her seat, and moved her hands uneasily. "You can go," said the foreman again; but she

did not start. A juror sitting near the door rose to show her out, and as he did so the woman said, —

“I do not wish to press the complaint. I want to withdraw it, and have the girl released.”

“Why so?” asked the foreman.

“Because,” — and her voice began to choke, — “because the girl is young, and I do not wish to ruin her. Somebody else urged her to steal the money, and I think she will do better in future. If I send her to prison she may become a professional thief, but if I give her a chance she will be a good girl. She is an orphan and has no friends, and I want to be her friend. I know she is guilty, but I want to be merciful, and I beg you to be merciful, gentlemen.”

Half her utterance was drowned with tears, which flowed rapidly down her face. The foreman told her to step outside and he would call her again in a few moments, and inform her of the result of her eloquent appeal. “Be merciful, gentlemen,” were her last words as she closed the door.

It was voted to dismiss the complaint; and when the foreman called her to the room, told her of the result of the vote, and commended her for her kindness of heart, her tears flowed afresh, and she thanked us through broken sobs. I know that in that room more eyes than hers were wet — eyes not accustomed to tears.

But soon a discussion arose as to the propriety of our action. When the grand jury was impanelled, the following oath was administered to the foreman: —

“You — —, as foreman of this grand inquest, shall diligently inquire, and true presentment make, of all such matters and things as shall be given you in charge; the counsel for the people of this state, your fellows, and your own, you shall keep secret; you shall present no one from envy, hatred, or malice; nor shall you leave any one unrepresented through fear, favor, affection, or hope of reward; but you shall present all things truly as they come to your knowledge, according to your understanding. So help you God!”

And to the other members the following oath was administered : —

“ The same oath which your foreman has taken on his part, you, and each of you, shall well and truly observe and keep on your part. So help you God ! ”

Some of the jurors thought we had no right, under our oath, to show favor, no matter how strong might be the appeal to our sympathies. Every man in the room wished to be lenient, but at the same time, above all other things, wished to do his duty. The discussion resulted in our sending for the district attorney and asking his advice.

After hearing the case, he said there was a difference of opinion as to the power of a grand jury. “ You can undoubtedly,” he continued, “ exercise your discretion in certain cases, and act as you think is for the best interests of society. It is both right and proper that the grand jury, and also the district attorney, should be clothed with a discretionary power, as it frequently happens that they can do more good by exercising it than by following the strict letter of the law. I will give you an illustration: Some years ago, the case of a young man charged with embezzlement was placed in my hands to prosecute. His employer was determined to push the case ; he was rather ugly about it, and there seemed no other course than to prosecute. The young man was out on bail, and came to me to beg to be let off. He said he was guilty, and should so plead ; that he had an invalid sister, and with the utmost economy on his small salary he was unable to support himself. He knew that this was no excuse for his theft, but he took the money under great temptation, and did not realize the enormity of his offence until after he had committed it. ‘ You can send me to the penitentiary,’ he said, ‘ and nobody can blame you ; but you will ruin me for life, and bring disgrace upon my parents and sister, who do not know that I am charged with crime. If I can be released and the matter hushed up, I will faithfully promise to do better in future, and I think this will be a life-long lesson to me.’ He pleaded so earnestly that I promised to do what I could for

him. I sent for his accuser, and urged him to withdraw the charge. At first he refused, but I laid the case before him in such a light that he at last consented. And I then urged him to take the young man back and give him a new trial, and after much talk I succeeded. The complaint was withdrawn, the young man was restored to his position; in a little time his salary was increased; by and by the firm dissolved in consequence of the death of one of its members; the young man went to another house, proved himself worthy of confidence, and to-day he is a member of that house, and as honorable and upright as any business man in New York. He has never forgotten, and never will forget, that lesson. If he had gone to the penitentiary, his worst fears would have been realized. When an offender is young, the offence is a first one, and the offender appears penitent, it is entirely proper for you to exercise leniency by dismissing the complaint; and in the case now before you, gentlemen, you have been entirely right in your action."

As the district attorney ended his remarks, there was a round of applause, in which I am very certain every member of the jury participated. Those who had been most doubtful of the propriety of our action were heartily glad that their doubts were not well founded.

During our session there were several cases in which the accusers wished to withdraw the complaints. Where the reason for the withdrawal was the youth and penitence of the accused, the request was generally granted. In one case a family quarrel had gone before a magistrate while the temper of all parties concerned was at fever-heat; passion had subsided in the time required to bring the case to the grand jury, and the complainant was anxious to make terms of peace with his antagonist. There was another pleasant little affair, in which a nose had been bitten off in a discussion that evidently had whiskey in it. The biter was the cousin of the bitten, and on account of the relationship the latter wished to be mild. His cousin was not a professional biter, and should he go to prison it would not restore the central ornament of the

complainant's face. The offender had promised not to do so again; and besides, he had not bitten off much of the nose, any way. The appeal was heard, and the complaint against the mordacious relative was dismissed. As he had been a month in prison, it is to be hoped that he took solemn warning, and will hereafter confine his dental exercise to the ordinary articles of diet.

In some instances the complainant wished to withdraw the charge, for the reason that he had already lost time in making the prosecution, and did not wish to lose more. Sometimes, in cases of robbery, the friends of the accused had offered to restore the stolen property on condition that there should be no prosecution, and very naturally the complainant was willing to make such a compromise. But it was out of his power to do so after having once made his complaint before the magistrate, and his appeal to the grand jury was generally of no avail. The well-being of society, in cases of professional thieves and the like, was held to be paramount to the desires of complainants, and if the testimony was clear there was no delay in ordering indictments. In one instance a man who had been robbed, in a house whose character was not at all doubtful, asked to withdraw the complaint because he had already lost too much time in following it. He did not think the accused was either young or penitent, but he could not afford the time he was devoting to the case. He had evidently been instructed what to do, as his testimony before the grand jury was quite different from that in his complaint sworn to before the magistrate. In his complaint he said he knew that the prisoner took the money, but when in our presence he was uncertain on the subject. He didn't know, couldn't tell, didn't remember, was excited at the time, and so on, until we found that he was determined to say and know nothing. As there were no other witnesses, we were forced to dismiss the charge, though morally convinced of the guilt of the accused. The complainant had determined to have the case abandoned, and as the prejudices of the nineteenth century are opposed to the use of the rack and thumb-screws

in the grand jury room, we had no means of compelling the witness to adhere to his original story. Mind you, he had not varied it so as to make him liable to the charge of perjury, in one case or the other; he had only substituted uncertainty for certainty.

Another instance of the withdrawal of a complaint through motives of kindness, was in the case of a woman who had lost a few articles from her room while her door was left open. The thieves were some young boys, whose parents were respectable; and as soon as the theft was traced to the culprits, the property was at once returned. "I don't want to make felons of them," said the woman; "I think they took the things out of a spirit of mischief, and that they will be good boys in future. The mother of one of them has talked to me about it, and I have promised to withdraw the charge." Her appeal was earnest, and before its close it was eloquent. When she left the room it was voted to dismiss the case. The foreman then sent for her, told her that she had displayed much kindness of heart; that the jury appreciated her motives, and had complied with her request. Her thanks, like those of the woman mentioned heretofore, were given through tears, and she rushed outside to congratulate the anxious mother of the boy whom she had released.

Many phases of human nature can be studied in the grand jury room. The hatred which the natives of green Erin bear towards our citizens of African descent is frequently seen where the accused is of negro blood, and the witness is of the race that boasts the Blarney Stone, and grows indignant at mention of Boyne water. Given such a case, and the chances are more than even that the witness will tell a story in which indictment is the primary, and truth the secondary consideration. If you have two or more witnesses of the loquacious nationality, and take the pains to question them closely, you will be likely to find a conspicuous inharmony in their testimony. They seem to consider themselves called to "swear agin' the nagur," and they generally do it. And it is possible that, with the case reversed, — an accused Celt and a testify-

ing Ethiopian,—the evidence might be equally energetic. But, for some reason, we did not have a fair opportunity to settle this momentous question, and I must therefore leave it for the consideration of some grand jury of the future.

The detective officer shines brilliantly before the grand jury. There was, now and then, a man of this profession who was quiet and unpretending, but he formed an exception to the rule. The detective had generally done wonderful things in the discovery of crimes already committed, or in the prevention of crimes contemplated or progressing. Some detectives told their stories with admirable directness, while others were evidently desirous of giving condensed histories of their professional careers. "Did you arrest John Jones?" asks the foreman when a detective is called in. "Yes, sir," is the reply. "Why did you arrest him?" "Because I heard he had robbed Brown's store." "Did you find anything in his possession?" "Yes, sir." "What did you find?" "The articles named in the complaint." "That will do, officer; you can go;" and the officer bows, and departs.

This is all that the jury wants to know from the officer in regard to the performance of John Jones, who is charged, on complaint of Brown, with burglary in the first degree. But the probabilities are two to one that when the foreman asks, "Did you arrest John Jones?" the officer will say, "I was walking along Broadway, and saw Brown, who looked as if he had been robbed. I went to his store, and saw the mark of a chisel near the lock, and asked Brown if he had lost anything. Brown told me he had, but did not know who had robbed him. I looked at the chisel-mark, and thought it was Jones's work. Then I went down Canal Street, and saw Jones standing talking with two men, one of whom I remembered seeing seven years ago at the California State Prison, when I took the great stage-robber Smith up there for robbing the Petaluma mail, and frightening a lady passenger so that she died next week, and left two girls, three boys, and one husband, who felt so bad about it that he got married before the month was out. Jones looked so innocent that I knew he was guilty;

and so I followed him all the afternoon, and arrested him when I saw him go into a house on the Bowery. I searched the house, and found Brown's goods concealed where it was not likely anybody could find them ; and there was a lot of other goods that I recognized as coming from a store on Broadway, that was robbed six weeks before." And so he goes on, in a way calculated to impress his hearers with the belief that he is a man of genius, and perfectly at home among thieves. He knows all the movements of the gentry that one does not like to be intimate with, and when he finishes his narrative, you contemplate him (to use the language of a certain celebrated orator about another) as the East Indian contemplates his favorite idol: you know that he is ugly, but you feel that he is great. The story of a detective will frequently convey the idea that the movements and actions of professional thieves can be studied, like those of the robin or the beaver ; and I have sometimes thought that the burglar and pickpocket should occupy places in natural history along with the birds, beasts, and reptiles that inhabit the earth and make things lively. One officer, who was a witness in several cases, was a favorite with the jury, for the reason that he always gave his testimony in the clearest and most direct manner. I doubt if he used a dozen superfluous words in any instance, and I could almost say that he did not use a dozen of them all together. His statements were short, sharp, and decisive ; and it is my impression that he is far more efficient in the service than some of his professional brethren who would occupy fifteen minutes in telling a story that he could give in sixty seconds, and have time to spare.

It is amusing to note the difference in the manner of witnesses. There are some who cannot tell a direct story, no matter how strongly they are urged to do so ; and there are others who could not be otherwise than brief. Some of this difference is due to nationality. German and Irish were generally more loquacious than American and English. But it was not all a matter of nationality, as there were instances of extreme discursiveness on the part of the last-mentioned,

while some of the former were brief almost to taciturnity. And in regard to sex, I must aver that the more talkative of our witnesses belonged to the gentler half of humanity. A lady of Baxter Street was one day testifying about a debate between herself and a neighbor: a brick and a broomstick had been used in the fray, and the head of the witness had been slightly scarified by the corner of the brick. It was a simple affair,—words and blows, and only two or three blows, at that,—but the unhappy victim could not be induced to tell her story without narrating the whole history of the bellicose Bridget, whose hand had hurled the missile. Frequently the foreman stopped her narrative, and told her to cut it short; she would take breath in the pause, and then, with a preliminary “I’ll tell all about it, yer honor,” she would start again with the rapidity of a carrier-pigeon. We soon found it was of no use to attempt to restrain her, and so we listened as patiently as possible to the conclusion of her story. There was a sigh of relief around the jury-room when she retired, and I could not help thinking that the blow which she averred made her “sinseless and spacheless” for two hours was, to a great extent, justifiable.

Another garrulous witness was a German who had suffered robbery. He persisted in addressing the foreman as “shudge” and the rest of the assemblage as “gentlemens on the jury.” Twice, when interrupted and told to be brief, he complied by beginning his statement anew, with more minuteness of detail; and at last the foreman found his patience exhausted, and told the witness, “The jury has no time to listen to your stories.” “O shudge,” said the man, in a tone that evinced the most deeply wounded honor, “I don’t not come here to tells you stories; I tells you only the truth.” The polite foreman apologized for the unintentional affront, and compromised the matter by inducing the victim to answer a few questions, and leave his story to be told in court. His evidence was conclusive, and an indictment was promptly ordered against the party named in the complaint.

Frequently there were cases that attested the worthless-

**THE INTERESTING WITNESS.**

**THE KNOWING WITNESS.**

**THE DEAF WITNESS.**

**THE IRRELEVANT WITNESS.**

ness and depravity of certain members of the human race, and their despicable treatment of relatives and friends. It is an unpleasant spectacle to see wives giving evidence to send their husbands to prison, brothers testifying against their brothers, and sometimes (though none were called before us) fathers testifying against their sons. There was one instance wherein a man testified to a forgery of his signature, committed by a member of his family. He stated that it was a struggle between duty and a respect for the family name for him to come before the jury; "and I only determined to come here," said he, "when I found all attempts to reform this man had failed. I have paid his debts repeatedly, have twice started him in business, and have several times paid checks on which he forged my signature, rather than expose him. I have tried to reason with him, and hoped he would do better; he shows no sign of repentance, and has told others that, out of regard to the family, I shall not dare to prosecute him. I feel that I should do wrong if I allowed him to run longer, and painful as it is, I must do my duty."

Here was a man of sensibility compelled by the conduct of a near relative to appear in court as a prosecutor. It is to be hoped that the culprit will learn a wholesome lesson from his imprisonment; but if his nature is as depraved as represented, the probabilities are, that when he comes out from his term of involuntary labor, he will not be greatly improved.

One day a woman came to testify against her husband for striking her on the head with a piece of iron, which she produced from her pocket. The iron — a stove-hook — had been broken by the force of the blow, and yet the woman was there, with no evidence of having suffered more than a temporary stunning and bleeding. She began her story in a tone of firmness and determination, but gradually melted until her voice was choking and her eyes were tearful. "Do you want to press this complaint against your husband?" the foreman asked. "Yes, sir, I must," she answered, after a pause. "We have been married ten years, and they have been ten years of quarrels. He beats me often; he drives me out at night;

he starves me, and is all the time cruel. He takes the money I earn, and spends it, and I cannot live with him any longer. I have had him before the magistrate several times, and he promises to do better; but when he is let off, he is as bad as ever. He will not leave me, nor let me leave him, and we shall have no peace till he is in prison, or one of us is dead."

One of the most artistic frauds that ever came to my knowledge was developed before the jury. A man had loaned some money, and taken the mortgage of a tract of land as security on the note. Before loaning it he submitted the title to his lawyer, who informed him that it was correct; and consequently the bargain was closed. The note fell due, and went to protest; the lawyer had, in the mean time, moved from the city, and the other parties were not to be found. The land which was mortgaged lay in New Jersey, and the holder of the note took the necessary steps to foreclose. A professional searcher of titles went to the township mentioned in the papers, and found that there was no such land in existence.

The whole document was purely a myth. The boundaries described could not be found, and had no existence any more than if they had been located in the middle of the Atlantic Ocean. The grantor named in the original deed had been dead ten years at the time when the document was dated, and the whole business was a conspiracy, in which the lawyer had betrayed his client. One of the conspirators had turned state's evidence, and came before us. His position was not particularly comfortable, and he grew restive under the questions showered upon him. Little by little the truth was drawn from him, and he practically confessed to having been the originator of the fraud, ten years ago. The papers were evidently prepared with care, and had an appearance of genuineness enough to deceive any man who was not suspicious of wrong, and had relied upon his lawyer to protect his rights.

A case that was at the same time amusing and saddening, was that of a woman, the widow of a laborer, whose horse and cart had been stolen. She was the complainant and principal witness against the thief, who was promptly indicted. She

stated that she had recovered the cart, but had not been able to find the horse. The morning after the indictment had been ordered, we were surprised to see her waiting outside the grand jury room. A juror asked her what she wanted, and she replied that she came for her horse.

She was sent to the court-room, where, I believe, the thief was speedily tried and convicted. But day after day she came to the grand jury room, and patiently waited outside for the return of her horse. Each morning some one would explain to her that we could do nothing, and she would then go away. But the next morning she would be there as usual, and for nearly a month she continued her patient but hopeless watching. Sometimes she would come twice in the same day, and, when accosted, her answer was always the same, "I want my horse." At first her visits were subjects of merriment, but it was very soon discovered that her mind could not be altogether clear; and our merriment was changed to pity, and our jests to words of sympathy for her loss.

Most of the witnesses were of the unattractive lot, and as their stories were much alike, the business became a little dull after the first week or two. Robberies and fights, and fights and robberies, were narrated until the atmosphere became charged with them. It was the same story, or the same stories with slight variation, and we used to wish for a little variety. And it was astonishing how the advent of a pretty woman used to refresh the wearied jurors, but they were not often allowed that luxury.

One afternoon we came to a case of robbery, and the name of the first witness had a feminine sound as the clerk read it. Jurors had been sitting, not quite at their ease, listening to the testimony of men and women whose stories were as devoid of sentiment as the certificate of a steamboat inspector, and whose forms and faces were as unattractive as a dredging machine. When the witness was called in this case, the jurors listlessly raised their eyebrows, and out of deference to their acquired habit, turned their eyes towards the door. She came; we saw; she conquered. She was pretty; she

was finely attired; her demeanor was full of modesty, and, at the same time, of self-possession. As she walked forward to the foreman's place, to be sworn, there was a general straightening of everybody around the room. Chairs were drawn nearer to the table, young jurors stroked their mustaches, and old ones passed their hands over their bald crowns, to be sure that no cobwebs lay there. Collars and neckties were examined, to ascertain if *en règle*, and when the lady walked to the witness chair, the double line of heads was as straight and attentive as though just from the discipline of a Russian drill-master. When the foreman questioned her, she answered in a voice as silvery as a chime of tea bells, and it seemed very unfortunate for all her listeners that her story was brief. Not a word that she spoke was lost to any of the forty ears that were inclined towards her, and when she turned upon us a pair of bewitching eyes (I forget their color), there could be no doubt that the unwashed and unlettered burglar against whom she complained deserved the severest penalty of the law. As she left the room, her silken dress rustling like the leaves of autumn in a gentle breeze, we regretted that she could not longer remain; and when the door closed, an impressible juror sitting near it moved a bill of indictment, which would have been carried without opposition, had there been no necessity for another witness to complete the chain of evidence. The officer who captured the thief and recovered the property was then called; but he was a commonplace fellow, and we only listened to his story in the cause of justice. Compared with the lady who preceded him, he was as a marine turtle to a gazelle, or as a mud-scow to a yacht, and we were heartily glad when he was through with his testimony. If burglars would be free, they should never be caught robbing a pretty woman who can go before a grand jury. That fellow received the heaviest sentence allowed by the law, as *she* went before the petit jury, and told her story under the eye of the judge.

### GOLD AND ITS USES.

ANTIQUITY OF GOLD. — ITS WORSHIP. — ANCIENT GOLD MINES. — KING SOLOMON. — GOLD IN AMERICA. — STORY OF A HUNTER. — THE SHEPHERD AND THE CHILD. — HOW PIZARRO EUCHEED THE PERUVIAN KING. — SUTTER'S FORT AND SAW-MILL. — MARSHALL'S DISCOVERY IN THE MILL-RACE. — ROMANCE AND REALITY. — SPREADING THE NEWS. — NAVIGATION UNDER DISADVANTAGES. — THE GOLD EXCITEMENT. — THE PAN AND ROCKER. — THE AUTHOR AS A GOLD MINER. — HOW HE WORKED THE ROCKER. — HARRY AND HIS TIN DIPPER. — DISAPPOINTMENT AND DINNER. — VICISSITUDES OF GOLD MINING.

THE most valuable metal generally known is gold, and it is likewise one of the most ancient. It is found in various parts of the globe, and is sufficiently scarce, and sufficiently hard to obtain, to make it precious. No doubt there is enough of it in the composition of this globe, if it could be easily obtained, to make it a very common metal. An Irishman once said, speaking of the gold mines of California, that there was sufficient of the precious metal there, but it was terribly mixed up with dirt. If it were not for this mixing with dirt, and the difficulty of separating it, all of us might have gold enough and to spare, though it is quite possible that it might be of no more value than tin or brass.

The peculiarity of gold is, that it is never obtained entirely pure. Silver is always alloyed with it, but in no definite proportions. One of the purest specimens ever obtained gave, when analyzed, ninety-eight hundredths of gold, while the remaining two hundredths were about equally divided between silver and copper. Sometimes gold is found alloyed with silver in about equal proportions.

Gold is frequently referred to in the Scriptures, both in the  
(785)

Old Testament and in the New; in one of the earliest books of the Old Testament many applications of gold are described similar to those of the present day. It was beaten into plates, drawn into wires, and even woven with threads of linen for priestly robes. It was fashioned into breastplates, wrought into chains, and used as a setting for precious stones.

Sometimes it was made into gods and idols, and in some parts of the world it is worshipped as an idol up to the present day. A great many men and women in this nineteenth century worship gold more earnestly and more devotedly than they worship anything else.

The ancients, when they wrought their gold into idols, evidently had a keen perception of human nature.

An idol of iron or of wood may be of little account; but let one be made of gold, especially of solid gold, and with diamonds for eyes, and the whole world will fall down and worship it.

Where the ancients obtained their gold is not positively known, but it is supposed that it was brought from Africa or the East Indies, for the reason that the fleet of Solomon, in addition to gold, brought back ivory, spices, precious stones, ebony, peacocks, apes, and sandal wood. The cargoes of King Solomon were evidently of a widely assorted character, and doubtless found a good market. Gold mines were evidently worked in the desert of Gobi in the early days, and along the Ural Mountains there are now found the traces of ancient mining operations supposed to date back to the time of King Solomon.

In the time of the Romans gold was not so abundant, and in the middle ages the production was very small. At the date of the discovery of America, it was estimated that the whole amount of gold and silver in the old world was about one hundred and seventy millions of dollars, and that the supply obtained each year did not exceed the loss by wear and other forms of destruction.

To enumerate all the gold mines of the world would require much more space than I have at my disposal. Nearly all parts of Europe contain deposits of the precious metal, though

in many places where the ground is known to be auriferous the deposits are too poor to pay the expenses of working. The richest gold mines of Europe are in Russia, particularly along the Ural Mountains. The eastern slope of the Ural Mountains is more productive than the western, and the richest portion of Northern Asia, so far as gold is concerned, is in Eastern Siberia. Gold mining in that region, although not productive, is comparatively in its infancy, and great results may be looked for before many years. Until quite recently all mines in Russia were owned by the government, and were operated by officers in the interest of the crown. The result was, that there was very little enterprise displayed in mining operations. The officer in charge of a mining district would be unwilling to take any active steps, or run great risks in the explorations in the interest of the gold mines, as he would know that if he failed to return a profit to the government he would very likely lose his place. Consequently nearly all the mining operations were conducted on a sure basis.

Some years ago the Russian government changed its policy, and began throwing open its mining works to private enterprise, exacting from the miners a liberal percentage of the gross amount of gold and silver which they had obtained. The result was, that under the stimulus of the enterprise, — in which private organizations will always excel the government, — the mining interest in Russia increased rapidly, and the government now obtains from its percentage a much larger annual revenue than it had obtained before from the gold.

The discoveries of gold in America date from a very early period. There were large quantities of gold and silver in the hands of the Peruvians and the Aztecs at the time of the famous expedition of Pizarro and Cortes. A story is told of one of the captured kings of Peru, who, in order to secure his ransom, agreed to bring together in two months gold and silver enough to fill his room. This would have been a sufficiently great undertaking had he been confined in an ordinary

prison cell; but his captor, with an eye to business, had put him in a large apartment, suited to his royal state. The room is said to have been twenty-two feet long, seventeen feet wide, and nine feet high. Such was the richness of Peru in the precious metals, that the old king had no doubt of his ability to meet his contract; and he did fill the room in the time. When his work was finished, and the metal was melted, it was found that he had collected over fifteen millions of dollars—a very handsome sum to pay for his liberty, which he did not get after all.

From the time of the discovery in America until 1520, there was more gold than silver exported to Europe; but about that time Mexico was conquered, and large quantities of silver were obtained. In the first three hundred years succeeding the discovery of America, the receipts of American gold were estimated at three and a half times the production of the old world, and those of silver at twelve times the amount of this metal produced outside of America. Gold was dug in America many hundreds of years ago. In some portions of Georgia the ruins of ancient huts and utensils were uncovered a few years ago in working some of the mines, and they are supposed to have belonged to a race of men now extinct, though it is contended by some persons that these gold works belonged to the period of Ferdinand de Soto. In the early part of this century gold mines were successfully worked in the Carolinas, Georgia, and other states; but latterly the yield from these mines has greatly declined, and the returns of gold are quite small.

The discoveries of gold in California in 1848, and in Australia three years later, are events in the history of the human race of more importance than the discoveries of Mexico and Peru in the days of Cortes and Pizarro. These discoveries have given a new impetus to the migratory population of the whole world, built up large cities and regions where before there was only a wilderness, carried civilization and commerce where they were never known before, brought together strange people of all nations, mingling them in harmony side

by side, and have done more, perhaps, in the cause of universal peace and good will among all nations than any other discoveries of the present day.

In California, more than in any other part of America, people of all nations are assembled. In the streets of San Francisco one may see the synagogue, the church, and the pagoda. Christian and pagan, Jew and gentile, are mingled in the crowds that pass along the streets, and they are found laboring side by side to obtain the chief end of a large part of human existence — the possession of wealth.

The discovery of gold in California, like many discoveries of gold and silver elsewhere, was not the work of science. It very often happens that those find who do not seek. A shepherd, a poor laborer, and even children are chosen by Nature to reveal to the world the treasures which she holds beneath the surface. It was not Columbus, nor Cortes, nor Pizarro who discovered the silver of South America, but an Indian hunter. The most famous silver mines of Peru were found in the same way. One day a shepherd, leading his flock to feed on the slopes of the Andes, lighted some bushes to prepare his frugal meal. A pebble heated by the flame attracted his attention through its brightness, which reflected the rays of the sun. He found the stone massive and heavy, and finally carried it to the mint at Lima, where it was tested, and proved to be silver. The poor shepherd through his discovery became a millionaire.

A hunter, climbing the rocks in search of game, pulled up a bush, and found pieces of silver imbedded in the earth which the roots retained. A child, playing one day in the valley near the cottage of a poor peasant in Russia, picked up a shining pebble, and brought it home. The pebble was found to be very heavy, and on examination proved to be of gold. Investigations followed this discovery, and an extensive gold field was opened.

The discovery of gold in California was accidental. Captain Sutter, who had seen many vicissitudes and adventures in Europe and the wilds of America, arrived in California in

1839; and two years later he obtained a grant of land, and built a fort, which soon became the refuge for people coming into the country. The pioneers of California all bear testimony to the generosity of Captain Sutter at the time when his fort was the capital, and he was king of the American colony in the valley of the Sacramento. The legislature of California a few years ago recognized his claims to the generosity of the people of the Pacific coast by granting him a small pension for the remainder of his life.

Captain Sutter erected a saw-mill on the south fork of the American River, at a place now called Coloma. On the 19th day of January, 1848, James W. Marshall, while engaged in digging a race for the saw-mill, found some pieces of yellow metal, which he and the half dozen men working with him at the mill supposed to be gold. He was confident of the importance of the discovery, but he knew nothing of chemistry or gold mining, and therefore could not prove the nature of the metal, or know how to obtain it in paying quantities. Every day he examined the mill-race to look for the metal; every man at the mill thought Marshall was very wild, and so paid little attention to him. The swift current of the mill-race washed away much of the earth, and by this means particles of gold were left behind.

In a little while Marshall had quite a collection of specimens, and his associates began to think that possibly there might be a gold mine there after all. About the middle of February, one of the party employed at the mill went to San Francisco, and took these specimens with him. He was introduced to a gold miner from Georgia, who was immediately satisfied of the character of the metal, and knew that the diggings must be rich. This miner, Humphrey by name, determined to go at once to the mill, and examine the digging.

He arrived there on the 7th of March, and found work going on at the mill just as if there was no gold within a thousand miles. The next day he took a pan and spade, and washed some of the dirt from the bottom of the mill-race; and in a few hours he pronounced the mine the richest he had

**JAS. W. MARSHALL, THE DISCOVERER OF GOLD IN CALIFORNIA.**

**SUTTER'S MILL, WHERE THE FIRST GOLD WAS DISCOVERED IN CALIFORNIA.**

ever seen or known in Georgia. He then made a rocker, and went to work washing for gold, and every day he obtained an ounce or two of metal. The men at the mill made rockers for themselves, and all were soon busy in searching for gold. Everything else was abandoned.

The rumor of the discovery did not spread rapidly. In the middle of March the owner of a large rancho at the head of the Sacramento valley visited Sutter's fort, heard of the mining at Coloma, and went to see it. He said that if similarity of formation could be taken as proof, there must be gold on his rancho. So, after ascertaining the mode of washing, he posted off, and in a few weeks was at work on the bars of Clear Creek, nearly two hundred miles from Coloma. A few days later, another man visited the mill, and the result was, that in less than a month, he had a party of Indians washing gold on Feather River, twenty-five miles from Coloma. Thus the gold mines were opened almost simultaneously at distant points.

The first printed notice of the discovery of gold was given in a newspaper published in San Francisco, on the 15th of March. On the 29th of May, the same paper announced that its publication would be suspended, and said, —

“The whole country, from San Francisco to Los Angeles, and from the sea-shore to the base of the Sierra Nevada, resounds with the sordid cry of, Gold ! gold ! gold ! — while the field is left half planted, the house half built, and everything neglected but the manufacture of picks, and shovels, and the means of transportation to the spot where a man obtained one hundred and twenty dollars' worth of the real stuff in one day's washing, and the average for all concerned was twenty dollars per diem.”

The towns and villages were deserted. Farmers left their fields, and the crews of ships at anchor in San Francisco Bay deserted ; soldiers left their posts ; herdsmen abandoned their charges, and everybody made the quickest possible speed to the mines. Merchants of San Francisco found their clerks leaving their counters, and in many instances, after struggling

against fate, finding themselves alone, without assistance and unable to obtain any, they closed their shops, and followed the example of their subordinates.

It is related that one day a ship came into port, having taken a pilot outside the entrance to the bay. The pilot, in the hearing of some of the crew, told the captain of the wonderful discovery, and, as he afterwards acknowledged, exaggerated the real state of affairs very considerably. The ship came to anchor about sunset, and was to be moved to her dock the next morning. When the captain went on deck to wait the arrival of his pilot, he found nobody on board. The sailors had heard the story of wonderful fortunes to be obtained in the mines, and they had stolen a boat, and gone ashore. The first and second mates had followed the example of the men, leaving the captain to his solitary ship. The pilot came off, as agreed. He was a conservative old grandfather, who did not believe in making money; otherwise there would have been no pilot at all. He told the captain that it was useless to try to get the ship to the dock, or do anything with her; and the latter, after thinking the matter over, concluded it would be best to leave the craft at anchor, put her in charge of a keeper, if such a man could possibly be found, and make a journey to the mines himself.

The first specimen of gold sent from California to New York was forwarded to the editor of the New York Herald, the paper which was first on the Atlantic coast to announce the discovery. The first rumors were received with incredulity and ridicule, but very soon the specimens of the precious metal coming in considerable quantities, and the enthusiastic letters of officers of the army and men of good repute, changed the current of feeling, and an almost unparalleled excitement began. It spread through Europe and Asia, and the thirst for gold was universal. In 1847 the population of California altogether was not fifteen thousand; in 1849 the great rush began, and it was estimated that, during the six months from the 1st of July, 1849, to the 1st of January, 1850, ninety thousand persons arrived in California from Mexico, Chili, Peru, the Sandwich Islands, United States, and Europe. Of this ninety

CHINESE GOLD MINING IN CALIFORNIA.

thousand, such were the hardships they had to endure, and the privations to which they were subjected, one fifth of the entire number perished by disease within six months succeeding their arrival.

Before 1850 the population of California had risen to one hundred thousand, and it has been increasing ever since. Its population ten years later was estimated at about seven hundred thousand.

It is a curious fact that most of the rich placer diggings in California were discovered within three or four years of the discovery at Sutter's mill-race. Some rich deposits have been found since that time, but none of them of any great importance. The placer fields of California to-day are pretty nearly worked out, and the most extensive mining of that state is now prosecuted by machinery.

The earlier diggings were in the valleys or streams or in gulches, opening into the valleys. The washings were first conducted with a sheet iron pan, held in the hands of the miner, who could wash only a few quarts of earth at a time. An improvement upon the pan was the rocker, a box arranged so that it could be rocked like a cradle, with no board at one end, with a few slats nailed across the bottom to catch the gold, and having a piece of sheet iron on the top pierced with holes a quarter of an inch in diameter. Earth was thrown upon this iron, and water was poured on. The cradle was set upon a slight incline, so that the stones rolled off at the end, while the water, with the earth, sand, and gold, was carried through. The gold caught upon the riffles, while the lighter substances were washed away. Nuggets, or large pieces of gold that would not pass through the holes, were sometimes thrown out with the stone and lost; but the danger of such an occurrence was not very great, principally for the reason that nuggets were not alarmingly abundant.

Two men were required to work a rocker. It was placed by the side of a stream, and one man grasping its handle with one hand, flourished a dipper in the other. His companion brought the auriferous earth to the machine, and threw it upon the iron. Man number one would then throw a quantity of

water upon the earth, and agitate the machine as rapidly as possible. The earth and water would become mixed, and pass through the holes, and the stone would roll away from the end of the cradle. It was necessary to keep the water running pretty briskly on the top of the machine, and likewise to keep it well supplied with earth. By the end of the day's working at this business, the two men would be delightfully wearied and ready to engage in almost any other honorable and profitable pursuit, especially a profitable one.

My first experience with a rocker was not of an agreeable character. Accompanied by a friend, I went to a locality where it was reported that a miner a few days before had obtained eight hundred dollars in a single day. We were willing to begin at that rate, though we were confident we should make a thousand a day before the end of the week. We carried our tools to the spot, and having placed our rocker, began work. I worked the machine, and Harry, as I will call my friend, supplied it with earth. I placed the machine by the side of the stream where I could easily dip out the water, and told Harry to begin.

For about an hour the machine did very lively work. Whenever I lagged, Harry would remind me of the eight hundred dollar man. Then I would give an extra flourish to the tin dipper, and pile on an extra quart of water. I kept Harry busy bringing earth, and he kept me busy washing it away. At the end of an hour or so we thought we would see how things were getting on.

I raised the lid, examined the riffles, and not a particle of gold was to be seen. The result was not encouraging, and I told Harry we had better move a little way down the stream, and try it again. We did so.

This time Harry took the rocker, and I went into the shovelling business. We made things lively for another hour. Harry was sure we were right this time, as the earth was of a different color, and the water, as it ran from the machine, was so yellow, that it certainly must be tinged with gold. What we most feared was to lose the big nuggets that might roll out from the rocker, and so we examined every stone with

GOLD WASHING IN THE CALIFORNIA MINES.

all the care of a geological student ; but somehow there was not a nugget among the whole lot, and after a while we thought the nugget business was played out.

When we had been in this new place an hour, we concluded to adjourn for dinner. Harry wanted to look into the rocker, but I told him our appetites might be better if we waited until after dinner for the examination. Our dinner was a very plain one, consisting of a piece of bread that might have been sold for a brick, and a slice of pork that had probably come down from the Silurian period.

We were temperate in drinking ; that is to say, we drank nothing but water, and it may be proper to add, that we had nothing but water to drink. During the meal we consoled and congratulated ourselves upon being in the eight hundred dollar region. We had counted in the morning upon making at least that sum, but now we were willing to put up with four or five hundred. Our air castles were reasonably gorgeous, though somehow the pains in our backs and legs, diminished their brilliancy.

When our meal was finished, we raised the lid and began examining the rocker. This time there was something in the riffles, and we exulted. Close examination, however, showed that there was nothing there except black sand, a few small pebbles, and three or four particles of gold, each about as large as a pin's head. We changed our base of operations, and moved again to a new spot.

I do not think either of us was ever harder worked and more weary than at the end of that day. We had pains enough all over our bodies to set up a window market, and if we did not sleep well that night, it was not for lack of weariness. We were a trifle disgusted to find that in our verdancy we had been washing what the miners call "strippings," that is, the surface earth which lies above the pay dirt. We might as well have washed the sweepings of Broadway, and hope to obtain gold. We learned something by experience, as a great many others have done. "Working the rocker," we concluded, was too severe for lazy men, and we speedily gave it up.

## LVI.

### GOLD MINING.

VARIOUS WAYS OF MINING GOLD. — SLUICING AND HYDRAULIC MINING. — ACCIDENT TO A MINER. — A NARROW ESCAPE. — POWER OF WATER IN HYDRAULIC MINING. — EFFECT ON RIVERS AND BAYS. — A SCENE OF DESOLATION. — QUARTZ MINING. — QUICKSILVER AND ITS AMALGAM. — STOCK OPERATIONS. — THE MARIPOSA MINES. — THE AUTHOR'S VISIT. — HAYWARD'S MINE. — MANIPULATION OF MARIPOSA. — FUNNY STORY OF A SEA CAPTAIN. — HOW HE SUPERINTENDED A MINE. — HIS MANAGEMENT OF A MILL. — ACCIDENTS ON PURPOSE, AND HASTY FLIGHT.

UNDERGROUND work in gold mining does not properly begin with the surface washings. It is true the earth is torn out, and large excavations are made; but they are all done by the light of day, and where the open air circulates through them. As heretofore stated, the primitive form of gold-digging is with the pan and the rocker. After the rocker, there are several forms of sluicing, or washing away of the earth. The ordinary construction of a sluice is a long box, with a current of water running through it. The earth is thrown into the sluice, washed towards its lower end, and carried away by the water. The stones, of various sizes, are thrown out with a shovel or fork; the gold and black sand fall by their weight, and are caught in the riffles, or cleats, nailed across the bottom of the sluice. Earth which will not pay for working with the pan or rocker can be made profitable in this mode of operation, for the reason that one man or two men can wash with the sluice many times the quantity of earth that they could work with the primitive process.

Another form of sluice, known as "Long Tom," is generally elevated upon posts, a foot or two above the ground. At its upper end there is a covering of sheet iron, very much like that which covers the rocker. Another system of surface

(802)

mining is that which is known as hydraulic mining, and by means of it, earth that will not pay for washing in any other way can be worked to advantage. By this process the miners will tear down large banks and hills, and wash them entirely away. The process was invented in 1852, by Edward Mattison, a native of Connecticut, and introduced by him to great advantage. The water is conducted through iron tubes, terminating in a flexible hose with a nozzle like that of a fire engine. The "head" of the water must be many feet higher than the place where it emerges from the hose, so as to give an enormous pressure.

Equipped in this way the miner washes away the base of the bank. In a little while the upper part falls, and as the gravelly ground is composed of pebbles, and is naturally rather loosely consolidated, large masses of the hill come down with a violent crash. The greatest danger to life in this kind of mining is in the falls of the earth.

I was once at a place near Grass Valley, California, where they were at work by means of hydraulic mining. A large cavity had been cut away under the base of the hill with the streams of water. Every moment the hill was expected to fall, but somehow it seemed to retain its position. One of the men incautiously ventured near it, and just as he had done so, the earth fell, and the man was partially buried beneath it. He screamed loudly with pain. His companions rushed forward to relieve him, when another mass of earth fell, partially burying two of those who had come to his rescue. Other men went to their assistance, and in a little while the three were extricated.

The first man had his leg broken, and one foot badly crushed. The other two were severely bruised, and the foot of one of them was permanently injured. It frequently happens that in this way men are killed or injured partially through want of caution, and partially owing to the dangers inseparably connected with hydraulic mining.

The force of water thrown in this way, with an enormous pressure, is almost wonderful. The solid earth is cut and torn

away, and sometimes stones weighing several pounds are tossed into the air. The particles of earth fly in all directions. The water rebounds sometimes, and in a little while the men who manage the hose are thoroughly drenched. On a level surface a stream of water directed upon the solid earth at an angle of twelve or thirteen degrees, will cut a trench or furrow with the rapidity of a plough. When the earth falls, the largest blocks are broken up with the pick or with the streams of water, and the *débris* is thrown into a large channel, or flume, at the basis of the hill where the work is going on. The flume has riffles at its bottom, and many turnings, so that the gold may be saved. The stream of water carries away the earth, and leaves the gold behind.

There is no system of mining more destructive than this. Hills are cut away, and sometimes, for many acres, the rock is laid bare. The whole scene is one of desolation. The earth that is washed down fills the channels of rivers, and is sometimes carried a long distance. Before California was opened for gold mining, the water of her streams was perfectly clear; but since the beginning of mining the streams have lost their pellucid character, and the discolored water extends to the Bay of San Francisco, and sometimes out to sea. The lower part of the Sacramento River has been partially filled up, and there are parts of the great bay which are now much shallower than of old.

As the surface diggings of California showed signs of exhaustion, attention was given to mining in quartz rock. In the ledges of the mountain-sides veins were discovered rich in gold, and pieces of the rock taken from these veins gave promise of profitable working.

The man with pick, and pan, and rocker required but little capital for the prosecution of his enterprise; but mining in the quartz rock requires money to conduct it. Shafts must be sunk, and levels must be driven; the ore must be raised to the surface, the rock must be pulverized, and the gold extracted; and the machinery to accomplish this is more or less elaborate, and always costly. The mines are worked in the

**MINERS PROSPECTING.**

same way as other underground mines. The shafts, the levels, the tunnels, are the same; but after the ore is raised, there is a great expense attending its reduction. The rock must be broken, and placed in pulverizing machines, and after it is crushed, whether by rollers or stamps, the gold must be separated.

The water which carries away the gold is made to flow where it comes in contact with quicksilver placed along a series of riffles. In many instances blankets are spread, over which the water flows; and as the gold comes in contact with the rough surface of these blankets, it is caught and held.

Some of the gold miners in California invented a table of amalgamated copper, on which quicksilver was spread, and the ore coming in contact with it was stopped.

There are other inventions for the same purpose. In one the pulverized ore is agitated in a bath of quicksilver, and in another an inclined trough is divided into compartments filled with quicksilver, in which a series of forks have an oscillating movement, to bring the sands in contact with the fluid metal as they flow through the troughs. Sometimes sheep-skins are used inside of blankets, so that the golden fleece can be considered an affair of modern times, as well as of the earliest days of ship-building.

In working the placer mines by the hydraulic process, the miner can manage with profit the dirt which contains only a millionth part of gold.

In the quartz mining, the proportion of gold ought naturally to be greater, since it is necessary to execute all the work, which is partly done at the placers by nature; that is, to dig, transport, pulverize, enrich the ore, and finally amalgamate it.

In California the quartz ores of least hardness cannot be worked profitably when they yield less than five dollars' worth of gold to the ton, or about one hundred thousandth proportion. Quicksilver is mainly employed in the auriferous quartz ores. When the gold of the placer is very fine, and invisible to the eye, or the work is done by means of long channels, riffles filled with quicksilver are placed in the bed of the stream,

which detain all the gold in its passage, no matter how small the particles. The scales of gold which come in contact with this fluid are instantly caught up, and no process has yet been invented which can supersede that of quicksilver.

The amalgam obtained in this way is generally liquid, but it is allowed to take up sufficient gold to give it the consistency of paste. It is passed through a chamois-skin folded into a bag, and twisted like a piece of wet linen. The quicksilver, being separated from the gold, passes through the pores of the skin in the form of silver drops, and is caught in a basin beneath. The gold must now be separated from the paste, and the amalgam left behind resembles a ball of tin. Quicksilver dissolves gold just as water dissolves sugar, but the quicksilver can be driven away in vapor, and the gold will remain. The amalgam can be made to give up its gold in the same way that a solution of sugar and water can be made to yield sugar candy. In this way gold may be considered the sugar candy of the miner.

The balls of amalgam are placed in an iron retort, which is heated in a furnace. At a high temperature the quicksilver boils, and ascends in the form of vapor towards the neck of the apparatus. The neck of the retort opens into a tub of water, which condenses the vaporized quicksilver, and causes it to fall to the bottom.

When the operation is concluded, the quicksilver is at the bottom of the tub, and the ball of gold is in the retort. With the quicksilver driven out, the gold has a porous and spongy appearance. It is remelted in crucibles, and then cast into bars. If the operation is properly conducted, hardly any of the quicksilver will be lost. I have known instances where miners have used a quantity of quicksilver twenty or thirty times over, with hardly any appreciable diminution of its weight.

A great many quartz mines have been opened in California, Colorado, and other portions of America. Some of them have returned much less money to their stockholders than to the men who organized the companies. During the height of the

mining fever, it was comparatively easy to organize a company, where a man had any reasonable supposition that a mine existed. All through California quartz mines were opened, but those which have paid a profit to the operators could almost be counted on the fingers' ends. The most profitable centre of quartz mining is in the vicinity of Grass Valley, a short distance from the line of the Central Pacific Railway. Most of the mines opened there have been profitable, though there are some which never made any money.

The richest and most famous of the Californian quartz mines is the one known as Hayward's. Its early history was one of disaster, but for several years it has been paying a steady and handsome profit to its owner. I remember, on my arrival in San Francisco, a resident of that city told me of Hayward's case.

"Hayward," said he, "used to have a hard time of it, but now he takes things easy. He spends most of his time in San Francisco, and once in every fortnight he goes up to the mill, and orders them to 'clean up.' They clean up; the gold is retorted, and he brings it down here. He has a clear income often or twelve thousand dollars a week from the mine, and appears to enjoy himself."

Probably the most famous mines of California, and those which have swallowed up the most money, are the Mariposa. Mariposa is a Spanish word, meaning "butterfly;" and there never was a more gaudy butterfly, to catch the eye of a speculating public, than the Mariposa of California. General Fremont obtained a grant of land on which the mines are located, and he organized a stock company, which was expected to return an enormous revenue; somehow the golden promise did not turn out brilliantly, and those who invested became heavy losers.

Mariposa went down, and carried with it a great many confiding men. By and by it came up again, and a new speculation was started. More money was invested, with pretty nearly the same result as before; and so it has gone on up to the present time; and once in a while there is a speculation

in Mariposa. Somebody wins a great deal of money, and somebody loses a great deal.

My only visit to the Mariposa mines convinced me that they are good things to make money out of, provided they could be operated to a great profit. There were five large mines on the Mariposa grant. Only one of them was at work, and at this one the superintendent politely refused to allow us an opportunity for inspection. He said they were taking out a fair amount of gold, but he thought their amalgamating process was not perfect; and consequently the shareholders could not expect a large dividend. It is possible he would have granted us permission to descend into the mine; but as two men had been killed recently in one of the tunnels, and a man, not long before, had fallen down the shaft, we concluded it was altogether too good a place for accidents, and one that we did not care to inspect.

The ways of the quartz miners — that is to say, of the owners of the mines — are something wonderful. Thousands of mines have been managed by men no more competent to superintend mining than to construct a new solar system. Some years ago I made the acquaintance of a sea captain who had retired from the service, and concluded to go into business. He had begun life as a cabin boy, having run away to sea. He next sailed before the mast, and had gone through all the grades, until he was qualified to be master of a ship. He had a brother-in-law who was a director in a mining company, and the directors, in their infinite wisdom, concluded that this retired sea captain, whose sands of life had not altogether run out, would make an excellent mining superintendent, as he was good for nothing else.

On what reasoning they based their determination I do not know. He had never seen a mine in all his life, and could not tell the difference between a piece of granite and a fragment of gold-bearing quartz. I met him one day, and he told me he was to start on the following morning for the scene of operations, where he would take charge of a mine. I lost sight of him for several months, but one day met him on

MINEERS AROUND THEIR CAMP-FIRE.

Broadway, looking as if he had just been sentenced to the penitentiary. I asked how his mining speculation was getting along, and he begged me not to talk about it.

"I told them," said he, "that I did not know anything about mining; but they shipped me out there, and told me to manage the craft the best way I could, and they knew I would get along all right. When I got there, a shaft had been made twenty or thirty feet down, and the mill was nearly completed. I was determined not to let on to the men there that I did not know all about the business, and when the man in charge of the works came to me, I told him to go ahead,—that he was doing everything all right. I hurried the mill up, and, as it was approaching completion, I went to the mouth of the shaft, looked at several heaps of rocks, pointed out one, and told them to crush that first. I saw the fellows sticking their quids in their larboard jaws, and supposed that it indicated that I knew what I was about.

"We went to work, and run the mill for a week, and the foreman asked me if he had not better clean up. I told him I did not think the mill looked very dirty, and guessed I would not clean up for a while. Fact is, I did not know what cleaning up meant. I visited a neighboring mine, got acquainted with the superintendent, who knew just about as much of the business as I did, and precious little more; but from him I found out what it was to 'clean up.'

"I thought I would let the mill run another week, and so I did. Then we cleaned up, and there was not a particle of gold to be found. I told the foreman he had not arranged things properly; that the quicksilver ought to be on the other side of the riffle, so as to catch the gold when it fell over. I bought blankets, and sheep-skins, and everything else, but could not accomplish anything.

"I used to go down in the mine occasionally, and somehow, every time I went there, there was always an accident—not a serious one, to be sure; but they would dump me out of the bucket, or run against me, or turn a hose on me by accident, or do something. I was getting into trouble every day, but

it never happened in such a way that I could accuse anybody. The country was not fit for a dog to live in, and I soon got tired of it.

"The company got tired of it too, and I kept writing such discouraging letters, and, besides, the sheriff came on me, and seized everything; so that they finally told me to come home. I left the place suddenly, took the stage coach, and started east.

"I had a back seat in the coach, and right in front of me were two men who were talking about the mines. They spoke of various things that did not interest me much, but finally one of them referred to the Ready Return Mine, which was the one I had been running.

"One of these fellows laughed, and said, 'I wish we had gone to see the Ready Return Mine. Jim Jackson says it is the funniest thing alive. There is a sailor there, superintendent of the mine, who does not know any more about mining than you do about the Ten Commandments. He came out there, pretended to be very wise, and set the boys to crushing wall rock—nothing but the meanest wall rock—with not an ounce of gold in a thousand tons of it. Well, they let him keep on, as there was not any gold there any way; and I reckon he has about spent all the company's money, and will have to bust pretty soon. They have a good deal of fun with him, and play all sorts of tricks on him. I wish we had gone there, and seen the fellow. When the mine busts completely, they are going to lower him down the shaft, under some pretext, then haul up the bucket, and let him stay a day or two, to teach him something about mining.'

"When I heard this," said my aquatic friend, "I made up my mind that I had had enough of that business; and then I knew how those fellows had been gagging me. You won't catch me at a gold mine again."

GROUND SLUICING.

HYDRAULIC MINING.

## LVII.

### COPPER AND COPPER MINES.

ANTIQUITY OF COPPER. — USE OF IT AMONG THE ANCIENTS. — OLDEST COINS. — THE COLOSSUS OF RHODES. — COPPER MINES OF ENGLAND AND OTHER COUNTRIES. — NATIVE COPPER. — HOW IT IS WORKED. — OVERTHROWING A MASS. — A LUMP WEIGHING EIGHT HUNDRED TONS. — MALACHITE.

ONE of the first metals known to man was copper. It is related in Scripture that Tubal Cain was “an instructor of every artificer in brass and in iron.” In the book of Job we read that “copper is molten out of the stone.” It is recorded in Egyptian history that the Emperor Cheops worked a copper mine in Sinai. The ancient Egyptians were familiar with copper, and the Syrians, Phœnicians, and also the Greeks and Romans, used a great deal of it in the manufacture of monuments and statues of bronze. The Colossus of Rhodes, after lying in the sand for nine hundred years, is said to have required nearly a thousand camels to convey its pieces away. The ancients seem to have worked copper mines very extensively, and their facilities for making large castings were quite equal to those of modern times.

Copper was known in America to the races that inhabited this continent before the Indians had any knowledge of it, as appears from the various utensils of copper found in the ancient mounds of the Western country and the extensive mining works along the shores of Lake Superior. The Mexicans and Peruvians had many tools of copper, and it is a curious fact that these tools are almost identical in composition with the tools found at Thebes and other points along the Nile. A chisel found in a silver mine in Peru contained ninety-four per cent. copper, five per cent. tin, and one per cent. iron.

Copper was used for money at a very early period. Some coins are in existence supposed to be twenty-five hundred years old. They contain from sixty to seventy-five per cent. of copper, and the residue is made up of tin, lead, and zinc.

The mines which supply the copper of commerce are situated in almost all parts of the world. Many of them are worked by English companies, and made tributary to the great smelting establishments at Swansea, in Wales. It is easier to carry ores to the localities where coal is mined, than it is to carry the coal to the copper mines. The great value of many copper ores admits of their transportation from the interior of countries to the sea-coast, and their shipment thence by sea to the place where they can be reduced with the greatest economy.

In America there are many smelting works on various parts of the coast, and at some interior points, but none of them are as extensive as the English ones.

Many copper mines are worked on the Andes, particularly in Chili and Peru. Central America and Mexico contain many mines, some of them of great value. Copper deposits are scattered throughout the United States, all the way from New England to California, though comparatively few of them are valuable. There are copper mines of great value and world-wide celebrity in Cornwall, England. Other parts of the British Isles produce this metal. There are valuable copper mines in Germany, Sweden, and Norway, and the mines of the Ural Mountains of Russia are among the richest on the globe. In 1830 the copper production of Great Britain was more than half the entire copper production of the world. Copper mining in other parts of the world was not extensively prosecuted; but subsequently the industry increased so rapidly that twenty-five years later the amount of copper produced in Great Britain, though not less in quantity, was only one fourth of that of the entire globe.

Occasionally circumstances give a great impetus to copper mining. For instance, in 1866, the war between Chili and Spain cut off the copper supply from the former country, and

**A COPPER MINE OF THE LAKE SUPERIOR REGION.**

**INTERIOR OF A COPPER MINE.**

gave a great impetus to copper mining elsewhere. In California several copper mines were opened, and were making an enormous profit for their owners, when suddenly the war between Spain and Chili came to an end, the Chilian mines were opened again, and the copper mines of California diminished greatly in value.

Copper is found in various forms ; sometimes in sulphurets or oxides, and crystallized in various ways. In some parts of the world it is found in a pure state.

Copper mines are very much like other mines, and do not require a special description. They may be tersely set down as holes in the ground ; and one hole in the ground, so far as light and darkness go, is very much like another. I remember that on one occasion, while travelling in a distant part of the world, I endeavored to urge a friend to accompany me to visit a curious cave. He shook his head doubtfully, and said, "O, it's nothing but a hole in the ground ; what's the use of going there ?" A few days later, I had arranged an excursion into a silver mine, and urged him to join me. He declined, with the remark, "What's the use of going into it? it's nothing but a hole in the ground." Again, when a mining excursion was in progress, he declined to be of the party because the place was in a hole in the ground, and he did not wish to get beneath the surface of the earth until he was dead.

It may be said of a copper mine, as of a coal mine, an iron mine, or anything else of the sort, "it's nothing but a hole in the ground ;" but if you should ask, as my friend did, "What's the use of going there ?" I think in many instances the owners could point to fine houses and heavy bank accounts, to show you, beyond a doubt, that there is a good deal of use in visiting the mine, or, at all events, in owning it.

Copper mines, some of them at least, are very good things to own, while others are very good to let alone. Many a speculator has come to grief by dabbling in copper stocks, while many another speculator has made a great deal of

money by it. Copper mining is very much like a lottery; there are prizes, and very valuable ones, and there are also a great number of blanks. In Cornwall, the Great Consolidated Mines, as they are called, made a profit in twenty years of three millions of dollars, and their product in one year was half a million dollars. In the next eight years the dividends dwindled down to a very small figure, owing to the expense of working, and for six years afterwards no dividend was declared; then, immediately after, rich deposits were found, and enormous dividends paid. An idea of the extent of these mines may be formed when it is known that the aggregate length of the underground workings is more than seventy miles.

One company in Cornwall paid in five dollars on each share, and its stock consisted of one thousand shares. In the first three months of regular working the amount cleared was seventy-five thousand dollars. In the following year it cleared one hundred thousand dollars. Five years later the dividends amounted to seventeen hundred dollars a share, and each share was worth two thousand dollars. This was a very fair profit on an investment of five dollars.

In another mine the shares originally cost twenty-five dollars each, and a few years later they were worth five thousand one hundred and seventy-five dollars a share.

One copper mine in Australia was opened in 1845. The whole amount of capital paid in was sixty thousand dollars, and the dividends up to March, 1850, were nine hundred thousand dollars. None of the dividends were less than fifty per cent. on the capital, and some were at the rate of two hundred per cent. Half a million dollars remained undivided, so that in five years the total profits amounted to nineteen times the whole amount of capital invested.

The copper region of Lake Superior contains almost the only mines that produce this metal profitably worked in the United States. The existence of masses of native copper had been known for a long time, but nothing was done towards mining in that region until the Indian title was extinguished,

in 1842. Immediately after this the country was rapidly taken up by adventurers from the Eastern States, and mining operations were begun. The state geologist, Dr. Houghton, had examined the country, and located the productive region on the range of the Trap Hills commencing on the south coast of Keweenaw Point. From Keweenaw Point the Trap Hills run in two or three parallel ranges, extending westward more than one hundred miles. There are other trap formations presenting some mineral indications, but most of the profitable mines are in this narrow belt. A great many mines have been opened, but comparatively few of them have been found profitable.

Copper ores are found in various conditions, but there are no mines in the world where there is so much of it in the native state as in the Lake Superior region. The largest masses stand upon their edges in the vein. Sometimes they are many yards in length and several feet in breadth, and their thickness varies from an inch to more than a yard. Silver is associated with copper, sometimes in occasional lumps unattached to the copper, though generally the two metals are in contact, as if the silver had been deposited with the copper, without forming an alloy with it. I believe no alloy of the two metals is ever found there, and consequently they can never have been in a fused condition in contact. The lumps of silver vary in weight from a few grains to several pounds.

Masses of copper of great size have been found. One was discovered several years ago containing at least five hundred tons, and other masses are said to have contained more than eight hundred tons.

The work of cutting out one of these masses sometimes occupies several weeks or months. The mass fills the entire vein, so that the rock must be removed on one side; the mass is thus left as a wall, its upper edge extending into the roof and its lower edge into the floor. When the side is laid bare, the mass is attacked at one end by introducing charges of powder, and as fast as room is obtained, and cracks are

opened between the copper and the rock, the size of these charges is increased. The usual form of blasting under such circumstances is by what is known as the "sand blast."

Powder is poured loosely into the openings in large quantities, and is then covered with dry sand. It is lighted by means of a safety fuse, which gives the men time to escape. The first blast will be in a small cavity, and as the cavities are enlarged more powder is introduced, until sometimes several hundred pounds are spread in the crevice and fired at once. In several instances one thousand pounds of powder have been burned at a single blast. When the mass has been thrown down in this way, the work of cutting it so that it can be removed begins.

Two miners strike in turn upon a long steel chisel held by a third, and thus gradually cut a groove across the copper. This work is repeated until the mass is cut through, and sometimes it requires an entire month to make a single cut. The mass is reduced into pieces weighing five or six tons each, which can be hoisted up the shaft, and it will then be cut into little morsels weighing not more than two or three tons each, so that it can be easily handled.

To give an idea of the extent of this kind of work, it may be stated that some years ago a mass of copper was uncovered on which nearly three thousand pounds of powder were expended before it was thrown over so that it could be cut. When it was thrown over it was forty-five feet long, and its greatest thickness was eight feet. Several months were required for cutting it up so that it could be removed, and it was estimated from its measurement to weigh more than five hundred tons. This mass copper usually yields more than ninety per cent. of pure metal.

The copper mines of Lake Superior are generally very profitable, where they pay at all, but investments in them should be made with great caution. Many copper companies have been organized, and the stock has been put upon the market and sold, when the mine had no existence except in the brain of its originator.

DRILLING IN A COPPER MINE

A very valuable substance found in copper mines is that known as malachite. Specimens of it are found in the Lake Superior district, in Australia, and sometimes in England. The greatest quantities of it—in fact the only quantities of any importance in the whole world—are in the Ural Mountains, in Russia. In the mine of Tagilsk, a pretty town of twenty-five thousand inhabitants, situated in the Ural Mountains, there is a valuable copper mine which produces immense quantities of malachite.

Malachite is a protocarbonate of copper, and by analysis yields seventy-one per cent. of protoxide of copper. It is distinguished for its beautiful green color, variegated in many ways, its fine texture, and its ability to receive high polish. It is used for jewelry, and is converted into tables, vases, and many articles of great beauty.

In the mine of Tagilsk, about thirty years ago, an enormous mass of malachite was discovered, and several years were required to remove it. If it could have been taken out in its natural state, it would have been the greatest curiosity of the known world. The whole weight of this mass was estimated at seven hundred and twenty thousand pounds. Sir Roderick Murchison examined this mass before it was touched by the wedge or hammer, and his description is quite interesting. He says,—

“The copper ground that we have been describing having been excavated by shafts, an enormous mass of malachite was detected at the depth of two hundred and eighty feet. These strings of green copper ore occurring at intervals were followed downward, when, increasing with width and value, they were found to terminate at the base of the present mine in an immense irregularly shaped mass of solid malachite. When we examined this mass, much of the surrounding matrix had been removed, and it presented an appearance of having been cast in a depression of the stone. We are disposed to view it as having resulted from copper solutions emanating from all the porous, loose, surrounding mass, and which, trickling through it to the lowest cavity in the sub-

jacent rock, have in a series of ages produced this wonderful subterranean incrustation."

In the great Exhibition of 1851, and in the Paris Exposition of 1867, wonderful specimens of this curious production of nature were exhibited. There were large doors of solid malachite, polished to the smoothness of mirrors, and the material was exhibited cut in various shapes. It is used for the manufacture of vases of all sizes, and is frequently worn as jewelry. In the Paris Exposition one piece was exhibited nearly ten feet in length. It was in its rough state, with the exception of one side, where it was highly polished.

In some of the Russian churches, particularly in the Church of St. Isaacs, at St. Petersburg, there are pillars twenty, thirty, and fifty feet in height, apparently of solid malachite. I say apparently, for the reason that the pillars are really of granite, and have been veneered with malachite. Some years ago, a vase was sent as a present by the Emperor of Russia to His Holiness the Pope, and has since been on exhibition in the Vatican. The vase is large enough to enable His Holiness to use it, if he so desired, as a bath-tub, or an aquarium. To the untaught spectator it is apparently of pure malachite, but a close observer will discover the lines where its fragments, or more properly the fragments of its veneering, are joined, for the vase is of stone covered with malachite, just as the pillars in St. Isaacs Church are covered. It is very pretty and very valuable, and visitors often remain long around it to study its beauty.

The annual production of copper is about eighty thousand tons. Of this, Great Britain and Chili produce about one fourth each, Russia produces one eighth, and America about one tenth. The rest of the production is shared by various parts of South America, by Cuba, by Sweden and Norway, Australia, and various parts of Europe. Asia produces about one twentieth of the full amount, but from Africa and Southern Europe only a small quantity is obtained.

## LVIII.

### THE CATACOMBS OF ROME.

THEIR AGE AND EXTENT. — THE SEVEN HILLS HONEYCOMBED. — HOW THE CATACOMBS WERE MADE. — THEIR USES. — THE CHRISTIAN MARTYRS. — IMMENSE BURIAL VAULTS. — MILLIONS OF PERSONS BURIED. — RESORTS OF ROBBERS. — STRANGE ADVENTURES. — VISITING THE CHURCH OF THE CAPUCHINS. — FANCY OF AN IRREVERENT AMERICAN. — DOWN THE CATACOMBS. — STORY OF THE GUIDE. — STRANGE EXPERIENCE OF TWO AMERICANS.

MANY cities of the old world can boast of catacombs. Those of Paris are famous in their way for the large number of skeletons which have been deposited in them. The catacombs in and near other cities have the same peculiarity, and the walls are frescoed and festooned with bones which are placed so as to form fantastic shapes, reflecting much credit upon the persons who arranged them.

The catacombs of Rome are quite interesting, partly from their character and partly from the associations connected with them. Many of them are of great antiquity, and can be traced back nearly to the time when the city was founded. The rock on which Rome is built was of volcanic origin. It is a soft, yellow stone, generally known as *tufa*, and can be quarried very easily. The workmen shaped their shafts pretty much as they pleased, the stone in many places being so soft that it could be cut with an axe. Some of them are more ancient even than the city which Romulus and Remus founded, and they are so extensive that the original seven hills on which Rome stands were perforated and honeycombed by enormous passages and galleries, in which one might easily be lost. As the building of the city progressed, the quarries were extended, some of them several miles away from the banks of the Tiber. During the time of the pros-

perity of Rome these quarries were opened in every direction, and were steadily worked until the city began to decline, and the materials of the old buildings were used for the construction of new ones.

For a good many hundred years Rome has had very little occasion to open new quarries, as the old stone inside the city is quite sufficient for most of the building purposes of the present day. For several centuries some of the great works constructed by the emperors were torn down to furnish building material. A great part of the Coliseum was removed in this way. Thousands of tons of stone were carried off, but the work was so vast that, in spite of all the efforts of man to destroy it, it remains to-day a gigantic monument of the greatness and glory of Rome.

Beneath the modern city of Rome there are many underground passages which are not generally classed with the catacombs. The most interesting of the catacombs, those which furnished homes and hiding-places for the early Christians, are outside the walls of the modern city, and are visited annually by a great many persons. It is not clear for what purpose these places were used after their abandonment as quarries, but it is generally believed they were the resort of robbers and other persons who were escaping from or avoiding justice. At the present time a close watch is kept over them, to prevent their occupation by brigands or other violators of the law. Only a few years ago a band of robbers had their headquarters in one of the catacombs, and carried on their depredations for several months before their place of concealment was discovered.

During the time of the persecution of the Christians, beginning with that under Nero, and followed by those of several other emperors, down to the last persecution, a great many persons who could not be safe anywhere else crowded into the catacombs. Some of them lived there for years, while many others spent the greater part of their time there, and only went to the surface at night. Many of the workmen around the quarries were very early converted to Chris-

tianity, and it is supposed that they greatly aided their fellow-Christians in finding secure places of retreat.

Very little attention was paid to the catacombs until nearly fourteen hundred years after the beginning of the Christian era. By that time the catacombs had ceased to be the abode of Christians, as it was no longer necessary for them to conceal themselves. Outlaws and assassins were gathered in large numbers in the catacombs, and it required very vigorous efforts on the part of the authorities to drive them out. The entrances to many of these places were closed altogether, and have remained closed ever since, so that there are numerous under-passages below and around the city of Rome which have not been visited for thousands of years, and their locality even is not known.

In 1535 the pope ordered some of the catacombs to be explored, and directed that they should be cleared and lighted. A great interest was awakened in subterranean Rome, and Father Bosio devoted about thirty years of his life to the exploration of the catacombs. He opened the way into some of the places which had been blocked up and closed for centuries, and he made drawings and descriptions of some of the most remarkable sculptures, paintings, monuments, and other things which he found there. Several books have been published concerning the catacombs, and anything like a full description of them would require thousands of pages.

During some of the explorations many valuable articles were carried away, until it was found that there was danger of the catacombs being entirely despoiled. Pope Clement VIII. took the catacombs under his especial protection, and forbade any one to enter or leave them without permission, or take away any article whatever, under penalty of excommunication. Since that time the catacombs have been regarded with great veneration as being the hiding-place of the early Christians, who adhered to their religious convictions through years of the severest persecution.

Every visitor to Rome makes, or is expected to make, a journey through the catacombs. Very soon after my arrival

in the Eternal City I started to make this tour. Our party went first, as a preparation for visiting the catacombs, to one of the churches (the Church of the Capuchins), which is in charge of about twenty-four monks. Underneath the church is the place where the monks after their death are buried. The earth in which they are placed came originally from Jerusalem, and the monks consider it a great honor to be planted there. This number of monks — not the same ones, by any means — have been in charge of the church for several centuries. Whenever any of them dies, he is buried with a good deal of ceremony; and, in order to find a place for him, the bones of one of his predecessors are dug up. The space is sufficiently large for burying forty or fifty persons, so that when one of the number has been placed under ground he is not likely to be disturbed for ten or twenty years. His bones, when removed from the earth, are placed with those of his predecessors. They are not piled up in heaps, as one might naturally suppose, but are fastened to the walls and ceilings of the little rooms that cover the cemetery.

Some of the walls are entirely covered with these bones. As you look at the walls a little distance away, you would think they were frescoed; but a near approach shows you that, instead of being fresco, it is alto-relievo. For example, one wall will have in its centre a skull, and around it will be a select assortment of the bones of the forearm. Then sections of the back-bone, fragments of fingers, toes, and all the bones familiar to the student of anatomy, will be arranged in artistic order, so that the wall forms an interesting picture. Sometimes the bones are arranged in the shape of wheels, and some of them are formed into wheels and stars.

One of the peculiar things connected with the visit to this spot is, that you are shown through the place by one of the monks, who stands complacently by, calling your attention to the bones of his predecessor, and regarding with calm satisfaction the prominent positions which they occupy. He knows very well that one of these days he will go into the

**CATACOMBS OF ROME.—THE THREE BROTHERS.**

earth which his lantern illuminates, and a few years later his bones will form a part of the mural ornaments. He contemplates death with satisfaction, as he knows he will be buried in a conspicuous resting-place, where people can call upon and admire him. The monk that guided us through the burial-ground was enthusiastic rather than otherwise, and seemed to look forward with delight to the time when he should form a part of an alto-relievo.

An irreverent member of our party proposed asking the monk if he did not think there would be a good deal of confusion at the day of judgment, when Gabriel's trumpet sounds, and the bones undertake to sort themselves out and get together. He suggested that the arms, and legs, and fingers, and toes, and back-bone joints would be a good deal mixed up, and that fragments of a dozen monks might be collected together and present themselves as one individual. He said the head of Brother Ignatius, the body of Brother Francis, and the arm of Brother Peter might be mixed up with the legs of Brother Simon, and an arm, or leg, or a rib of somebody else. We reprov'd him soundly for his levity, and told him he had better go.

Some of the catacombs are entered beneath the churches, while others are entered in the open ground. The first one we went to after leaving the church was at the right of the Appian Way, a little distance outside the city. There was a party inside when we reached there, and the guide who took us in charge said that the rules forbade two parties going down at the same time, and that we could not descend until the other returned; so we loitered around for a little time, until our predecessors came out. We found ourselves in the middle of a field, part of it cultivated and part of it in rich, luxuriant grass. To all external appearances the ground beneath was perfectly solid, and we almost began to think we had come to the wrong place.

The guide preceded us to a little hollow or excavation, down which there was a flight of steps. We stood around this until we saw some heads emerge from the ground two

or three hundred yards away; then the guide descended the steps, and we followed him. He unlocked a door and allowed us to enter; then he locked the door after us, and we found ourselves standing in a place where there was very little light, and it was evident that we must have candles before proceeding farther.

He produced the candles, and each of us produced a franc. Another carriage-load had joined us, so that our party consisted of seven or eight persons. The harvest for the guide was a very good one, and certainly allowed him no occasion to complain. When we had lighted our candles he told us to follow him, and we descended another flight of steps, and then struck off through a narrow gallery about six or seven feet high — narrow in some places, and in others enlarged to a width of ten or twenty feet.

As we went along, the guide explained to us the character of the place, its mode of construction, and the uses to which it had been put. He explained that the catacombs were originally quarries; that we were then in the second gallery from the surface, and that there were three similar galleries below us. He could take us through all of them if we wished to go, but the journey would be rather monotonous, as the objects to be seen in all were very much alike. This mode of working in galleries one above the other is not peculiar to the Roman catacombs, though it is more noticeable there than in any other locality. Imagine a hotel, half a mile square and five stories high, placed under ground, and you can form a very good idea of the arrangement of this catacomb.

All along the galleries there are little niches, called *loculi*, cut in the sides one above the other, just large enough to contain a single body. From nearly all these *loculi* the skeletons have been removed, but there is now and then a skeleton or so visible, and adding interest to the place. It is said that millions of bodies were buried in these catacombs during the time they were used for cemeteries. Those that have not been explored are still full of skeletons, and would fur-

nish relics enough to equip several thousand new churches. Here and there the guide pointed out small rooms or chambers in the tufa, where some of the Christians lived. There are inscriptions of a religious character scratched upon the walls of many of them, some being legible, while others are only partly so. Beneath many of the *loculi* there are inscriptions showing who are resting there, and at the entrance to one of the chambers, in which a dozen skeletons are leading a very quiet life, there is an elaborate door-plate set in mosaic.

The places where some of those who have since been canonized dwelt in their lifetime and were buried after death, were pointed out. Some of them were quite interesting, and several were ornamented with considerable care. Sometimes there were mosaics and marble monuments of considerable size; and at one spot a life-sized statue cut from the tufa rock, and evincing considerable skill on the part of its designer, was shown to us.

We followed our guide in single file. Some of our party were rather inattentive to his directions. Among them was a pair of lovers, who seemed much more interested in saying sweet things to each other than in looking at the curiosities of the place. Several times they lagged behind, and the rest of us were obliged to halt and wait for them to come up. Their dilatoriness caused the rest of the party at times to become separated, and as they showed a disposition to wander off in the side-galleries and corridors, we were apprehensive of losing some of them. Sure enough, when we reached our journey's end one of our number was missing.

Our guide left us and went back, and he was gone ten or fifteen minutes before he found the missing individual. When he brought him forward and we were united, the latter said that he thought we turned a certain corner while he was examining the grave and bones of an early Christian. He followed and could hear our voices, but was surprised to find that, in following us, he seemed to get no nearer. He thought a minute or two, and then concluded that he was

lost. He said his hair began to stand on end, and he was considerably relieved when he heard the voice of our guide shouting to him, and answered. The guide had some difficulty in finding him, as he had turned into a side-gallery and thence into another gallery; and had he gone a little farther, it might have taken some time to trace him out. I am entirely convinced that the next time he visits a catacomb he will take good care to keep within hearing distance, and seeing distance too, of the guide.

The guide told us that it was not unusual for people to be lost there, and he said that whenever they took a large party inside the catacombs they always counted them carefully both on entering and departing. "People," he said, "will stop and look at things while the rest of the party is moving on; and if we have a large number, they are quite likely to get lost. The galleries run in all directions, and in some places there are holes from a gallery to the one above or below. Unless a person is careful, and is aware of their locality, he may fall down one of these holes, and be severely injured, or perhaps killed." After he had told us of the danger of getting lost, he said, —

"I once took two Americans into one of the catacombs, along with a party of a dozen or more. They had been drinking somewhat, and were not very sober. We had quite a long journey through the galleries, as it was late in the day, and I knew that no other party would be allowed to enter. We spent some time in the place, and then we went out, and I was so busy talking when we came out that I forgot to count the party. I locked the door and went home, supposing all was right.

"In two or three hours the driver of a carriage came to wake me, and said he had been all that time trying to find me. I asked what he wanted. He said he took two American gentlemen to go into the catacombs, and they had gone there; they had not come back to the carriage yet, and he was beginning to get alarmed about his pay. He did not think they would run away and cheat him, but he could not tell what had become of them.

"Just then I happened to think that I did not count the party when they came out, and quite likely the crowd might have been two men short; so I went and found the custodian of the place, and got permission to go into the catacombs. The rules forbid us to go into the catacombs between sunset and sunrise, unless we have a good reason; and I thought my excuse was good enough at that time. I was afraid that those Americans might be shut up there in the dark, as their candles were not very long, and unless they burned them singly, were not good for more than three hours.

"From the time I shut up the place until I got there again and unlocked the place, it was nearly five hours. The Americans are a strange people, as I found when I went down there.

"I expected to find these men, if I found them at all, half dead with fright, and wandering about or trembling in the darkness; but they were nothing of the sort. When I got down into the place and walked along one of the galleries, I heard somebody singing. He would sing a little while, and then he would whistle. I could hear a rattling of bones and a sound as if somebody was dancing.

"Well, gentlemen, as sure as I am a guide, when I came in sight of those men they were in a place where the gallery widened out into a sort of chamber, and there were some skeletons which had been tied together with wires and thongs. The chamber was about ten feet square, and these skeletons were in the niches in the side. Those fellows were there. One of them was sitting on the edge of a niche, and making music by singing or whistling. He kept time with a couple of leg-bones which he had in his hands. The other was hugging a skeleton as if it had been a queen of the ballet. I stood still five or ten minutes to see what they would do.

"When the fellow that was waltzing got tired, he seated his skeleton in the corner, bowed to it as if it had been a young lady, patted it on the cheek, and sat down. Then the other one got up and picked up the same skeleton; the one

who had just been dancing made the music, and the scene was repeated.

"I shouted to them; they looked a little surprised, and answered me.

"They said their candles were nearly out. As soon as they found that they were lost they concluded they must stay there all night; so they stopped right where they were, entered the chamber, and made themselves as comfortable as possible. The accommodations were not very good, but one of them said, 'Now that we are in for the night, I guess we will stay it out.'

"They gave me some money, sent me out for a couple of bottles of wine and something to eat, and told me to come again in the morning. They sent money enough to pay the driver. I bought a dozen candles, took them their overcoats from the carriage, so that they could use them in case they wanted to lie down on the ground, and they had a merry time of it all night.

"They promised not to disturb anything, and I knew they were gentlemen, and would keep their word. They did not sleep any, but kept carousing all night. They were ready to come out when I went there in the morning; and though they said they had plenty of fun, I don't believe they would care to stay over night in the catacombs again."

In some of the catacombs many persons of distinction have been buried. The place where the Christian martyrs were concealed has been regarded with such veneration that a great many people have considered it a high honor to be buried there. Sometimes people who had died in France, Spain, and other distant countries, were brought to Rome to find a sepulchre in the catacombs; and sometimes their funeral ceremonies were conducted with great pomp. Among the noted men buried in the catacombs were the Popes Leo I., Gregory the Great, Gregory II. and III., Leo IX.; also the Emperors Honorius, Valentinian, and Otho II. In most of the places now opened to visitors there are no graves of persons of distinction, though there are several of the second and third class.

**VAULTED CHAPEL IN THE CATACOMBS.**

**LOST IN THE CATACOMBS.**

The place where we emerged from the catacombs was some distance from where we descended into the earth. It was in the same field, and through an excavation which promised as little as the one by which we descended. The light of the Roman sun seemed much brighter than when we left it, and it was some minutes before ~~our~~ eyes were accustomed to its dazzling rays.

## LIX.

### THE PARISIAN RAG-PICKERS.

THEIR NUMBER AND EQUIPMENT. — THEIR KEEN-SIGHTEDNESS AND SKILL. — THE PLEASURE OF THE BOTTLE. — SEEKING COMFORT UNDER DIFFICULTIES. — UNWHOLESOME MAGAZINES. — WHERE AND HOW THE CHIFFONNIERS LIVE. — DISMAL AND NOISOME ABODES. — A SOUP LOTTERY. — QUAIN SCENES IN CHEAP BOOK-SHOPS. — TASTING ROAST CAT AND STEWED PUPPY. — ROMANCE IN DIRT-HEAPS. — A HIDEOUS HAG ONCE A FAMOUS BEAUTY. — PENITENCE AND REFORMATION THROUGH FIRE.

EVERYBODY who has been in Paris — and who has not? — remembers the rag-pickers, or chiffonniers, as they are styled, who frequent the streets after nightfall, searching the city through for the means of subsistence. One sees them so much, and in every quarter of the French capital, that he imagines there must be several thousand of them. The entire number, however, does not exceed six hundred, one half of whom are women and children. Though rag-pickers in name, they are something more in fact, since they gather up every article of the most trifling value — old corks, fragments of bone or glass, coal or wood, scraps of paper, ends of cigars, and all sorts of rubbish that can be sold for the fraction of a sou.

Everything is organized and licensed in Paris, the chiffonniers not excepted. After once entering on their calling, they usually remain in it for life. Many of them begin as children in their ninth or tenth year, and continue, while their limbs will bear them about, and their eyesight is good enough to detect the objects of their quest. They are usually so soiled and begrimed that it is hard to distinguish the young from the old, unless they be small children, and even these have the look of premature age.

They set out on their rounds between nine and ten o'clock in the evening, with a large willow basket strapped to their back, carrying in one hand a stick about a yard long, terminating in a hook, and in the other hand a lantern fastened to a piece of wire, so that they can swing it over the ground, and discover if there be anything they want. They pay particular attention to the little heaps of rubbish, made by the citizens before their doors, from the miscellaneous refuse of the household. After these have been raked by the rag-pickers, they are carried away by the scavengers' carts. The pickers-up of unconsidered trifles never waste any time or space. They understand the exact distance from one point to another, always moving in straight lines, and taking in everything at a glance. Their vision is like that of hawks. They very rarely miss anything, or confound one object with another. They know bone from wood, and coal from glass, though it be half buried in the mire, and transfer every desirable fragment to their basket by means of their hooks with unerring accuracy, and by a single curve movement. It is astonishing how quickly and thoroughly they can hunt through one of the little dirt-piles. After quitting it, it is as valueless as the notes of a western wildcat bank, or a second-hand tombstone.

They never encroach upon each other's domain, for they have their particular districts marked out, and generally visit them unaccompanied, darting about in silence, without the least indirectness, dawdling, or delay. They are certainly among the most industrious and indefatigable of laborers, if not the tidiest and most fastidious. They go forth in all sorts of weather, night after night, month after month, and year after year; patient, plodding, never discouraged while there is the slightest chance of finding a bit of leather or scrap of paper in the entire capital. So dexterous are they by long practice in the use of their hook, that they very seldom employ their fingers.

The night-wandering gypsies have the highest expectations from the gutters, where they are often delighted by securing

a prize that yields them a whole centime, — one fifth of a cent, — and when they discover what will sell for a sou, they deem themselves blessed. There, cigar stumps, remnants of shoes, and broken bottles, are sometimes found, and are enough to cheer the heart of the rag-picker for weeks after fortune has ceased to smile upon his nocturnal gleaning. At long intervals a whole bottle dawns upon his vision, and he is as much rejoiced as an American would be if he should stumble upon a treasure of gold buried in his cellar.

The pleasures of the bottle have a new interpretation with the chiffonniers of Paris. The phrase has a literal, not a figurative meaning with them, and I have heard them speak of finding half a dozen bottles in one week, as Ponce de Leon might have spoken of discovering the fountain of eternal youth.

I remember to have bound one of the guild to me in eternal gratitude by presenting him with a few empty wine bottles, as he passed my lodgings one stormy night. He regarded me as a gentleman of munificent income; he went away, I am persuaded, with a semi-conviction that I owned the Bank of France.

One would hardly think that the poor devils of the hook and basket would attempt to have any comfort in this life. But they do; for they are French, and must have dissipation and distraction, however humble and homely it be. After midnight, they visit the cheap wine-shops, where they can purchase as much wine as they want for two or three sous. They smoke their pipes there, and have very pleasant chafs, manifesting a gayety in their rags and dirt that only a Gaul can feel. They even get mildly tipsy sometimes, but usually start off with their baskets before daylight, make another round, and then sell their collection to the rag and refuse merchants who are their regular customers. The contents of their baskets, holding some two bushels, will bring from twenty cents to one dollar in our money, the average rate being from forty to fifty cents.

The merchants have large magazines in the quarters

frequented by the chiffonniers, and employ scores of men and women to assort and arrange their unwholesome purchases. The air of the magazines is vitiated and poisoned by the exhalations from mouldy leather, greasy rags, filthy bones, and repulsive rubbish generally. How those whose duty it is to attend to this obnoxious business escape contagion is by no means clear. It may be they are so defiled and encrusted with dirt themselves, that they cannot receive any harm from what they handle, though if they were neat in habit, or if their pores were open, they could not fail to be made sick unto death by breathing such tainted air. They are advanced in years, or infirm in body, having belonged, most of them, to the rag-picking profession when they were younger, and in sounder health. They prefer the more active, open-air duties, but are forced by circumstances and their condition into this lower grade of offensive industry. For twelve hours of labor a day, they are paid about thirty cents, and on this, in some unaccountable way, they contrive to keep their wretched bodies and souls together.

I ceased to wonder how the rag-pickers lived when I discovered where and under what surroundings they lived. Live indeed? Theirs is a satire upon life. It does not deserve the name of subsistence, or even vegetation, for subsistence and vegetation are at least natural and salutary. Few strangers in Paris ever see such miserable quarters as are the damp, dreary, and ill-ventilated cellars of the Quartier Monftard, in the neighborhood of the old Barrière des Deux Moulins, in which the chiffonniers reside. In those narrow and dismal streets, reminding me of the streets in the old Spanish towns, the sunshine is shut out, and the fresh breeze of heaven is unknown. In those vile dens, the unfortunate toilers herd together, frequently sleeping ten or twelve in a small apartment, regardless of age or sex, paying three or four sous a night for their detestable lodgings. Some of the aged and less impoverished couples pretend to keep house; but it is after so sorry a fashion that their homes would be unwelcome to a respectable beast.

The majority of the rag-pickers sleep where they can, and take their meals in the dismal cook-shops, eating whatever is given them, and asking no questions. Worthless dogs that have come to tragic ends are there served up for beef, and cats, whose nocturnal serenade has been suddenly brought to a close by the hurling of an unappreciative brick, are placed upon a rude table and labelled as mutton. Customers who work hard, and earn but three or four dollars a week, are not fastidious. Whatever satisfies the cravings of hunger is pronounced good, and where very little is charged, very little must be expected.

I busied myself one day in investigating the quarters of the chiffonniers, because I always feel an interest in the human family in its least favorable conditions ; but what I saw did not induce me to repeat the experiment.

One of the cook-shops that I entered had a very remarkable way of feeding its patrons, combining the excitement of chance with practical advantage. The proprietor of the place purchases from the restaurants such scraps and fragments as are left upon the tables and in the kitchen, puts them in a large pot full of water, and submits them to a long boiling. The result, quite a savory soup, is placed on a table, and anybody, by paying two sous, has the privilege of thrusting a long iron fork into the kettle, and of eating whatever he can bring up from the bottom. Sometimes the handler of the fork is rewarded with a very tolerable piece of beef, mutton, chicken, goose-liver, or some genuine delicacy that may have been ordered at a fashionable restaurant in the Boulevards. Even if the fork come up without the hoped-for prize, the adventurer is entitled to a plate of the soup, relished none the less because the eater has had the boldness to risk his sous for something more substantial. This culinary game is called the fortune of the fork (*hasard de la fourchette*), and is much enjoyed by the chiffonniers. I felt a curious interest in it myself, though I lacked the relish of hunger, and consequently the personal sympathy properly belonging to the entertainment.

The rag-pickers gathered about the table on which the large kettle stood, watching with eager eyes the fellow who handled the fork, and made a dash for the invisible morsel he so craved. When he brought up nothing, he showed no disappointment, but laughed with the throng; and when he was lucky enough to lift upon the tines what is called in Paris a *bonne bouche*, they applauded him with hands and voice, as if he had obtained a grand victory. The rude and dingy cook-shop, with the soiled and tattered rag-pickers in the centre, and the burly proprietor in the background, made a picture which Doré would have been pleased to draw.

The soup had an appetizing odor, and I could not doubt that what appealed so much to one sense must be grateful to another. I told my companion, a young New Yorker, that I thought of tasting it; whereupon he offered to bet me the price of a dinner at the Café Anglais that I durst not obey my thought. I called at once for a plate of the *potage*, and really found it excellent, twenty times better than much that I have eaten in first-class hotels at home. The effort of my friend to thwart my humor by talking to me of broiled horse, roast cat, boiled parrot, and stewed puppy, had no effect. I finished the soup with satisfaction, and at the dinner which I had won expressed my regret that the *Julienne* we had there was not so good as the mysterious mixture in the *Quartier Mouftard*.

The *chiffonniers* are reputed to be extremely honest. As evidence of this, they are very seldom arrested for any violation of law, and, according to the French code, the finder of any article of value is considered guilty of larceny unless he makes some effort to restore the property. In a great and luxurious city like Paris, many such articles must necessarily be lost, and they are very likely to fall into the possession of the rag-pickers. The representatives of this order are constantly discovering objects which they must feel a strong temptation to keep. Still, they do not yield to the temptation, but deposit what they find with the commissioner of police, who gives a receipt, and takes the name and address of the finder. The thing found is carried to the Prefecture,

where it is held, with many other articles, for twelve months; and if, during that time, no one claims it, it is returned to the finder on the presentation of the receipt. In no other city can you feel half so certain of regaining what you have mislaid, or left, or dropped in some public place. I have known of watches and pocket-books (with something in them, too) restored, time and again. I have even recovered lost umbrellas, without the least trouble, and have been handed small pieces of money which I had left upon the tables of restaurants, several days after I had dined there.

Every week a list of articles found and deposited at the Prefecture of Police is published in the official journal, some of which, one would imagine, could not be very readily lost. Among the articles the most frequent are bank notes, portemonnaies, watches, jewelry, rings of keys, lorgnettes, canes, shawls, gloves, &c. But it is somewhat singular to note, as I have noted, in the list, casks of wine, barrels of brandy, sets of false teeth, wigs, baskets of newly-washed linen, petticoats, hats, and even babies, who have been accidentally left in omnibuses, railway cars, or the public parks, by absent-minded nurses or self-absorbed mothers.

The great majority of the rag-pickers are, as would necessarily be inferred, ignorant, and of the humblest origin. Some of them, however, are persons of education, who have fallen from their natural position through defect of their own, or adversity of circumstances.

I recollect a rag-picker — he must have been nearly fifty years of age — who passed nightly along the Grands Boulevards, and who, when not surveying the ground with his lantern, walked erect, and with military precision. I was told that he had been well born, was of an old and influential family, and had served with distinction in the army in Algiers. Cashiered for some irregular conduct, his family disowned him, and he began a course of dissipation, which soon left him without friends, money, or self-respect. He came to this country in the hope of being able to reform; but his habits of intemperance adhered to him, and after numerous disreputa-

ble experiences, and after several arrests on charges of stealing, he returned to Paris.

He could get no employment there of the kind he wanted, and after trying divers methods of obtaining a livelihood, he settled down, socially and mentally, into a rag-picker. Oddly enough, in this position he became industrious and moderately abstemious. Two years ago he was accounted one of the most energetic of his tribe, and often earned, with his lantern and his rake, fifty or sixty francs a week, which is much above the average. Having reached the lowest level, he seemed quite satisfied; and they who had talked with him said he never murmured at fortune, and very rarely referred to his antecedents. His health and strength were so well preserved, that he had continued in his grubbing occupation twelve or fifteen years longer than is customary with his class. This appears to be one of the few instances in which as men descend socially they rise morally.

Among the *trilleuses*,—the old women who arrange and assort the contents of the *chiffonniers'* baskets for the rag-merchants,—I recall, just before the Franco-German war, one of the ugliest hags it has ever been my fortune to see; and my observation of hags has been extensive, varied, and profound. One of Rembrandt's ancient females was youthful and beautiful to her, who attracted me, somewhat after an inverted fashion, by her positive hideousness. Seeing her one day in the *Cité Doré*, I inquired of a gendarme respecting her. He expressed his surprise that I did not recognize her, adding, "Everybody knows her. She is called the Belle of the Bottomless Pit (*Belle d'Enfer*).” He then gave me her history; and thus it ran:—

She was nearly seventy; forty years before, had been one of the handsomest and most courted of the *lorettes* of Paris. Everybody admired her lovely face and exquisite figure. Her fame as a beauty had extended to all the capitals of Europe. She had any number of wealthy lovers, and not a few young noblemen of high rank in her train. She lived like a queen. Her horses, and carriages, and toilets were

the envy of the most fashionable ladies; and when the name of Annette Gariteau was mentioned, as it constantly was, eulogies on her charms were upon every lip.

On retiring one night, her bed-curtains caught fire, and she was dreadfully burned. Not a single trace of her beauty was left, but in its stead a frightfully disfigured face, and a shrivelled and crippled form. For some weeks it was thought she could not live; and when she did recover, she was so disgusted with herself, she tried to commit suicide by drowning, by poison, and by charcoal. They all failed, and she then fancied it was the wish of Heaven she should atone for her past errors by living until nature summoned her. Since then she has been very pious, never neglecting her religious duties in the smallest particular. She became a rag-picker because she considered that the humblest of callings, and because she thought that in it she would best serve her purpose of penitence, and render her reformation clear as noonday in the eyes of all who had known her in her pride of iniquity.

That was a queer story, and would hardly have been plausible, or probable, except when told of a French woman. I heard it repeated several times afterwards, and have no reason to doubt its correctness. The tale made a deep impression on me; and now, whenever I see some deformed and miserable creature, I try to forget her deformity and misery by fancying that she may be another Annette Gariteau.

## LX.

### UNDERGROUND IN POLITICS.

TRICKS OF POLITICAL LIFE. — MUD-THROWING AND PROMISCUOUS ABUSE. — TERSE REMARKS OF PRESIDENT LINCOLN. — GENERAL JACKSON AND THE RUSSIAN MINISTER. — EDITORIAL WARFARE. — EASTERN AND WESTERN CUSTOMS. — HOLDING A COW'S TAIL TO WIN AN ELECTION. — TOM CORWIN AND THE LEFT HANDED FIDDLER. — DEFEATED BY A QUART OF BEANS. — STORIES OF NEW YORK POLITICS. — THE OLD FIRE DEPARTMENT. — THE TARGET COMPANIES. — THE GROWLER'S GUARDS AND THEIR MELANCHOLY FATE.

POLITICAL life in America, especially at the present time, contains a great many elements of a subterranean character. Time was when it was considered honorable to seek an office, or to accept one when offered. Respectability has not, it is true, entirely passed away from politicians, but very nearly so. In the time of George Washington, and of a few presidents who succeeded him, a politician was very much more a patriot than in this latter half of the nineteenth century. Washington was elected president with little, if any, of the abuse that has been showered upon the more recent presidents. As the country grew older and more populous and prosperous, politics became less and less reputable. A great many hard things were said of Presidents Madison, Monroe, and others; and during the days of General Jackson, political campaigns had assumed a good deal of savagery.

From the time of Jackson the modern system of political warfare seems to date, and with few exceptions it has grown steadily worse with each succeeding campaign.

A good story is told of President Jackson and his interview with a Russian minister.

The minister had been but a few weeks in this country  
(853)

when his attention was called to an article in an American newspaper, reflecting very severely upon Russia and its government. The minister was indignant; such things could not be allowed in his country, and he supposed it was only necessary to call the attention of the president to the offensive article to secure a suppression of the paper and the punishment of its editor. So he called upon the president, and after waiting a little, was ushered into the presence of the chief magistrate.

After the ordinary salutations were ended, he drew the paper from his pocket, and exhibited it to President Jackson. The latter read it, smiled, and said he very much regretted its appearance.

The minister expected that the president would immediately order that the offending editor should be arrested and imprisoned, and also expected that a severe punishment would be inflicted. He even went so far as to intimate that he and the government he represented should expect prompt and perfect justice. President Jackson was not familiar with Russian practice, and consequently needed an explanation of how things of this sort were managed in the land of the Muscovites.

The minister informed him, and again called attention to the offensive article. The president summoned his secretary, and told him to bring a quantity of newspapers which had been received that morning.

The secretary obeyed, and the newspapers were spread before the Russian minister. Jackson pointed out article after article ten times as abusive of himself as the article complained of had been of the Russian government. He then explained to his visitor that this was a free country, and men could say pretty much what they pleased. The only redress of a person assailed was through a suit for damages, or a prosecution for criminal libel. The minister retired much disgusted with America and the system of American politics.

The presidential campaigns from the days of Jackson until the present time have not been, all of them, as savage as the

one in question, but they have been quite enough so for all practical purposes. The private and public life of every candidate for the presidency has been thoroughly ventilated by his opponents so far as his misdeeds of any sort are concerned. Even the most harmless occurrences have been magnified, and twisted and turned in every direction, until they were made to assume a terrifying appearance. The reader of *Pickwick* will remember the deductions of Serjeant Buzfuz from the apparently harmless message, "Chops and tomato sauce," and what horrible meanings were concealed in the injunction, "Don't trouble yourself about the warming-pan." Those who remember the presidential election of 1852 will bear in mind the terrible crime of which General Scott was guilty when he confessed to sitting down to a hasty plate of soup.

Disconnected words, either spoken or written by presidential candidates, have been found almost criminal in the eyes of their opponents, and in some instances have had much to do with the defeat of a candidate. If a man wishes to find out how bad he is, how his heart is deceitful above all things and desperately wicked, let him secure a nomination for a high office. In the first place, he will run a risk of being obliged to do a great many things to which he would not otherwise stoop; and in the second place, whether he does them or not, he will have the credit of them; and once he is fairly nominated and in the field, he will find, if he is at all sensitive, that a perusal of the daily papers which oppose him will give him a very lively sense of his own unworthiness. I have often thought that if the pious people who conduct camp meetings, and endeavor to get up revivals, could only induce their ungodly hearers to run for office, and read the opposition papers while so running, they could convince them of their total depravity, and frighten them into a religious reformation a great deal quicker than in the ordinary way.

I have known many men who were candidates for office, and who in private life seemed to be very decent individuals, but when I read the papers, or heard the speakers that op-

posed them, I often wondered how these aspirants for office could have the impudence to show themselves in public.

There is a scriptural phrase in which the Psalmist confesses that he said in his haste, "All men are liars." If he lived at this day, and paid any attention to politics, he would make the same assertion, not in haste, but in the fullest deliberation. Men engaged in politics, who would not ordinarily be guilty of a falsehood, seem to consider it all right to tell any sort of untruths about their opponents.

In the campaign of 1872 there were enough falsehoods told about the opposing candidates and their supporters and friends to furnish the requisite capital with which to start a new establishment like the one over which his satanic majesty is supposed to preside as chief ruler. Some of the falsehoods were by insinuation, or by distortion of facts, while others were the genuine article, without the slightest foundation, and were given to the public without any compunction of conscience on the part of those who originated them. A funny thing about the whole business was, that many of the men engaged in the campaign could be very savage at each other in politics, and at the same time could meet on friendly terms.

I remember that in my younger days, while living in a small town in New England, I used to read the rival political papers of the county. The editors assailed each other in the most bitter manner, and also assailed their respective parties. I innocently asked, one day, if these men ever saw each other. On being told that they met frequently, I immediately imagined that their meeting must be something like that of the encounter of two rival tom-cats, and I fancied, that if they met often, and met in that way, there would speedily be nothing left of them.

I confessed to a good deal of surprise on ascertaining that the men, personally, were very friendly, and not unfrequently sat down to a social meal side by side, and ended it with a social glass of brandy and water. I thought, on learning this, that this case must be an exception to the general rule, but have long since been undeceived.

Stories of political intrigue might be told in sufficient number to fill a large volume. No man knows — unless he has had actual connection with politicians, or has been familiar with politics — the amount of intrigue and chicanery in every branch of political life. When a man aspires to office, there are many men and many interests to be considered and conciliated. Compromises must be made with other aspirants for the same office; subordinates must be won over, sometimes by threats, and sometimes by compromise. One man must receive money, another must receive something else, and the third must have a remembrance for his friend, or a relative of his friend, or a friend of a relative of his relative's friend. The ramifications are as numerous and as intricate as the roots of a tree, and generally a great deal more so.

If a man wants a taste of tophetical existence, he can find it quicker in politics than in anything else, particularly if the race is a close one, and the men with whom he comes in contact are not over-scrupulous; and I never knew that politicians, as a class, were troubled by any nice sense of honor.

The American public seems to be made up of two classes — those who want office, and those who do not; and it is sometimes difficult to determine which class is the more numerous. Whenever an office, no matter how low its character, happens to be vacant, there are numerous applicants for it. President Lincoln used to state this circumstance rather pointedly by saying that he was in the condition of a hog of the feminine persuasion that had more pigs than teats. He also stated, one day, that he had been trying to satisfy a whole army of aspirants for a certain office, and found himself in the predicament of an ambitious hen that undertook to sit upon and hatch a barrellful of eggs. He had spread himself as much as he could, but for the life of him he could not cover and warm all those eggs.

The cool effrontery of aspirants for office is sometimes amusing. President Jackson at one time was visited by a man who had done him some service in the election campaign, and wished to be rewarded. He desired to be appointed

minister to England, and would take nothing else. Jackson told him that that place was already filled, and then he consented to take a second-rate mission. There was none which could be offered, and then he consented to a consulate. Finding he could have no consulate, he was willing to become a postmaster; and so he came down, until he was willing to accept a subordinate clerkship; and he then rose to leave. Before closing the door, he turned back, and asked the president if he had not a pair of old trousers that he could give him.

President Pierce, in his younger days, when practising law in New Hampshire, defended a fellow charged with horse-stealing, or some other trivial offence, and managed to get the man clear. After the trial the innocent equine abductor disappeared, and neglected to pay his lawyer's fee. Pierce had almost forgotten the incident, and one day, soon after his inauguration, received a letter from the fellow, who was then living in a western state. He called to mind the successful defence the lawyer had made, and also referred to the fact that the latter had never received his fee. He wound up the letter by saying, "You are president now, and if you will give me a fat office, I will pay up that old bill."

In the local politics of different states of the Union different customs prevail. In the New England States it has never been the practice for a man to nominate himself for office, and to go openly into the field, and struggle to obtain it; but in some portions of the Western States, it is considered entirely proper for a man to announce himself as a candidate, and to take the stump in his own behalf. The method has many advantages as well as disadvantages; but the former are more numerous than the latter. Some of the best political debates ever known have been those wherein the candidates have been in the field side by side, travelling together, and holding discussions in the presence of the men whose votes they desired to secure. A great many interesting stories — some of them of a comical character — have been told of campaigns of this sort.

There are certain offices in the region of which I speak,

where the candidates do not nominate themselves, strictly speaking, though it is entirely allowable for them to make every effort in their own behalf. When the candidates on the opposing sides have been put up, they arrange for debates or discussions on the political questions. They travel together generally in the same carriage, keep on the best of terms, and constantly strive in every way to create the best impression, and make the most out of their discussion. Their efforts are not entirely confined to debates upon political questions, but upon securing the good will of everybody, and especially of those who influence more votes than their own.

At one time two candidates for a county office were traveling together, and stopped at night at the house of a man who was said to have the control of the votes of his township. It was also currently understood that his wife influenced him; so the two candidates set about securing the good will of the woman of the household. The one who was unsuccessful afterwards told how it happened.

"It was late at night," he said, "when we got there. We saw that she was sleepy, and concluded it was best not to talk too much, for fear of tiring her out. We went to bed together, and I made up my mind to be out early. When I woke, hang me if Jones wasn't gone. I got up, dressed as quick as I could, and went into the kitchen. Nobody was there, and there was no fire burning.

"I went out into the shed, brought a good supply of wood, and kindled a fire. Then I saw the water pail was empty, and I went to the well and brought a pail of water. Some potatoes were ready to be cooked; so I put them on the fire to boil. I looked around for something more to do, and would have set the table if I knew where they kept the dishes.

"Just then a sandy-haired urchin crawled out of the room, and I asked him where his mother was. He said she was out in the yard milking, and I went out there to see if I could do any good. When I got there I saw it was no use. There she was milking away as fast as she could on one side of the cow. A calf was trying to get at the cow on the other side,

and there stood Jones keeping the calf away with one hand, and holding the cow's tail with the other, so that she could not switch the old woman in the face. He was talking sweet to her, and I knew my case was fixed, anyhow. And that's how I lost the county."

Tom Corwin said that he once lost an election by running against a fellow who could fiddle with his left hand. "I could shoot at a mark, climb a greased pole, and do anything of that sort that anybody else could do, and I could play the fiddle after a fashion. Generally I had the crowd with me; almost always had it, in fact, until I came to run against that chap. The way of it was, when we could get a crowd of people together, this chap would say, 'Gentlemen, my opponent, Mr. Corwin, may be a very nice man. You may tie him up in a sack, and he will run; you may tie his hands and throw him into the river, and he will swim; he can shoot and ride in a circus; he can sing songs, preach, run a saw-mill, and do lots of other things; but, gentlemen, he can't fiddle with his left hand;' and then he would bring out that confounded fiddle, and he had the laugh on me in such a way that I could never get round him."

A candidate in Oregon once lost his election in a curious way. There were two men in the county who controlled most of the votes, and like the man to whom I have previously alluded, these individuals were controlled by their wives. The candidate whom I will call Lane determined to visit them, and cultivate the good graces of the women. At the first house he visited — that of Mr. Smith — he found that Smith and his wife were deeply interested in agriculture. So he talked potatoes and beans, and corn and turnips, and everything else, until they were perfectly delighted. He manifested a very great interest in agriculture, and dwelt enthusiastically on the subject of beans. Mrs. Smith had some pet beans, some that she had cultivated with a great deal of care, and Lane was delighted with them. He would certainly have some of those beans in his garden, and begged a quart of them for seed purposes. Of course Mrs. Smith was pleased to give him the

beans, tied them up with great care in a small sack, and he went on his way rejoicing. He was certain that he had captured the Smith family.

Brown, the other farmer, lived about twenty-five miles away, and he, too, was great on agriculture. Mrs. Brown had a garden of which she was deservedly proud. She took great pains with it, and she walked in it, talked in it, and stood in it, in sun and in rain, until she was about the complexion of an old saddle. Lane, when he discovered the lay of the land, renewed his eloquence on agriculture. Really he did not know much about it, and he made a few slips, like asking when they shook their pumpkin trees, and whether cucumbers grafted on a hyena flourished well in that climate; but altogether he got along very well. Mr. Brown and Mrs. Brown were delighted with Lane; he was sure to have all the votes they could control.

Lane reserved his best card for the last. Just as he was leaving he took from his saddle-bags the quart of beans which Mrs. Smith had given him.

"I am just going," he said, "and I have kept this for my farewell. The fame of yourself, Mrs. Brown, and the fame of your garden, are known throughout the country. It has often been mentioned to me, and when I was in Washington last year the president spoke about it. He gave me a quart of seed beans that were raised from some which were sent to him by the King of Madagascar. He told me to keep half of them for my garden, and give you the other half. I have already taken out a few for my own use, and I have the honor of presenting you with the remainder."

As he said this he delivered the precious package into Mrs. Brown's hand. Of course she was happy, and of course Lane was sure of her influence, and went away satisfied.

All might have gone well, had not Mrs. Smith paid a visit to Mrs. Brown on the following week. Of course the two ladies compared notes. The former discovered that the beans she had given to Lane had been given away the next day, and the latter discovered that the message of the president was a

myth, as also its accompanying document ; and when the election came off Lane was badly defeated.

Probably there is more underground life in politics in New York city and state than in any other part of the country; principally for the reason, not that men are any better or any worse, but there are more of them, and their bad qualities come out with more readiness. Everybody knows the story of the great frauds upon the treasury of the city of New York, and how they were conducted. Bad men obtained official positions, and used them for purposes of robbery. Good citizens paid little attention to politics, and allowed the others to do pretty much as they liked. This is about the whole story, briefly told. For many years the ballot-boxes and all the accompanying machinery have been in the hands of bad men, except at various intervals, when the outrages became too great for endurance. The overthrow of the so-called Tammany Ring was accomplished through a spasm which seized upon the honest portion of the public. How long it will last, or how long it will require to break it up, it is difficult to say.

New York is bad enough at any time, but it has now fewer bad features, leaving out the recent wholesale robbery, than at any time during the ten or fifteen years immediately preceding the late war. There was a time when the worst element of the population had almost complete control. At the elections it was dangerous for respectable men to visit certain polling-places, and vote a ticket in opposition to the one supported by the great crowd of thieves and their friends. Frequently the polls would be seized, and the voting would be conducted without the slightest regard to justice. Repeaters were allowed to vote ten or twenty times apiece, and sometimes a district would return a vote more numerous than all its inhabitants.

The modern practice of "counting in" or "counting out" a candidate had not then been invented, and it was necessary to have an actual number of votes deposited in the ballot-boxes; hence the various organizations of voters supported and paid for by the candidates for office.

One of the most effective voting associations in New York, in the days that are past, was the volunteer fire department. The fire companies were kept together through the influence of officials, for whom they voted and fought. The first step of an aspirant for political honors was to secure the friendship of a fire company. If the district was a large one, he secured the friendship of all the fire companies, and he could then consider his election pretty nearly a certainty. The companies did not contain, it is true, a very large voting element themselves, but they had many outsiders to look to them for support, and do as they commanded.

Growing out of the fire department was the organization of target companies, more numerous than the firemen themselves, and generally working in harmony with them. The target companies of twenty years ago were one of the greatest nuisances with which the city was infested. In the spring and autumn, they made excursions to places in the vicinity of New York, where they shot for prizes. The shooting was not very effective, but the prizes were certain to be obtained by somebody.

A great many fights grew out of these excursions, but they rarely had the good fortune to diminish the numbers of the excursionists. The prizes were of various grades, all the way from a leather medal upwards, the highest being awarded to the man who made the best shot, and the lowest to the poorest marksman. The politicians were required to pay the expenses of the excursions, and also to pay for the prizes; so that the marksmen themselves had nothing to do but to go to the target, and shoot.

The manner of obtaining a prize was decidedly cool. Whenever a candidate for office was nominated, he was sure to be made a mark for all the associations. He was not invited to contribute, and allowed his own choice whether he should contribute or not; but he would receive a note, telling him that the Excelsior or the Manhattan Target Company would go on an excursion on such a day, and he could send his prize to a designated place. It was taken for granted that he would

send a prize, and generally he did so; and in this way all these concerns maintained their existence, and carried terror to the hearts, and depletion to the pockets, of many aspiring politicians.

The outbreak of the war broke up nearly all these organizations, but some of them, though happily not many, have been revived since. The abolition of the volunteer fire department likewise injured their prosperity, but there are still too many of them for the peace and good-will of the city.

One of the firemen of the olden time told me, not long since, of a target company in his neighborhood, some twenty years ago, that was known as the Growler's Guard. He said it was organized mainly from workmen employed in a large foundry, and from members of a neighboring fire company. The foreman of the foundry was a noted growler. He found fault with everything and everybody. Nothing ever suited him, and it was a common saying, that whenever he expressed his satisfaction at anything, he was not in his right mind. When the company organized, he was chosen its captain; and out of compliment to his peculiarities, some one of the party proposed that the organization should be known as the "Growler's Guards."

At their next meeting they adopted a regulation that no member, under penalty of expulsion, should ever express himself satisfied with anything; an expression of satisfaction was to be deemed a sufficient reason for the expulsion of the offender. They carried out their agreement faithfully. They arranged to have their meetings in a rear room of a grog-shop. They began by finding fault with the room; then they found fault with the furniture, found fault with the light, with the drinks, the waiter, the cigars, the boy who brought the drinks, and then with the proprietor. The result was, at the end of the first meeting, a fight.

The proprietor of the grog-shop said he would be satisfied with an apology, and somebody was about to make it, when it occurred to him, that if he apologized, it would be considered that he was satisfied at something; and therefore he might be

expelled. Consequently he would not apologize. Another fight was the result, and as the rum-seller was a skilled fighter, he supped on the ear of his adversary.

They tried again to hold a meeting on somebody's premises, but their fault-finding got them into trouble; and their next meeting was held in the open air. They finally decided to give an excursion, and met at a certain place, at a certain time. When the music arrived, they found fault with it, because it had not come an hour before the time it was ordered. They found fault with the band, separately and collectively, with the instruments, and with the music, so that the leader of the band determined to go home. They wanted to retain the music, but according to their constitution and by-laws, they could not apologize; so they induced an outsider to apologize for them, and thus they retained their music.

They marched to their shooting-ground, growling at the policemen and the crowds which lined the sidewalk, the result being that several heads were broken. At the shooting-ground a considerable crowd attended them. They continued their growling until a fight occurred, and the whole excursion broke up in a grand row. The Growler's Guards never met again — at least under that name.

## LXI.

### BURIED TREASURES.

CAPTAIN KIDD. — HIS HISTORY. — HOW HE MADE HIS FORTUNE. — HIS MELANCHOLY FATE. — JOINT STOCK IN THE ADVENTURE GALLEY. — SEARCHING FOR TREASURES. — STORIES OF THE SEA-COAST. — TRADITIONS. — ADVENTURES OF A TREASURE-HUNTER. — BILL SANBORN, AND WHAT HE DID. — JIM FOLLETT'S DOG. — A PRACTICAL JOKER. — A MESSAGE FROM THE SANDS OF THE SEA. — BILL SANBORN'S DREAM. — FINDING THE CHEST. — A SUPERNATURAL VISITOR.

A NAUTICAL ballad, with which many persons are familiar, narrates the adventures of the celebrated Captain Kidd. It is composed in the autobiographical form, and its first line runs as follows:—

“My name was Robert Kidd, as I sailed, as I sailed.”

Evidently the distinguished pirate travelled, like many other robbers, under an alias; and it is interesting to know that his name was Robert Kidd *as he sailed*, for he certainly was not Robert, but William, Kidd when on shore and away from his marine wanderings. It is to be noted that he draws particular attention to his alias, by repeating the words *as I sailed*; obviously wishing to state his case plainly, and guard against any imputation that he called himself *Robert* when on shore, or when his ship was at anchor or becalmed. It must have been very inconvenient for the man of tender conscience to change his name from William to Robert whenever his ship was in motion, and from Robert to William again when from any cause she stopped. It made things lively for him if he ever got into one of those peculiar squalls of the Mozambique Channel, where for two or three days you have a puff of wind one minute and a dead calm the next, so that your sails are alternately filling and flapping, and flapping and filling, about as fast as you can count. But, throwing speculation aside, it

(866)

is sufficient to say that William Kidd was born about the middle of the seventeenth century, and followed the seas from his youth. About 1695 he was known as one of the boldest ship-masters sailing out of New York, and he became so famous that he attracted the favorable attention of the colonial government.

About the close of the century in which our hero was born, the depredations of pirates upon British commerce were so extensive that it was determined to send out privateers to attack the freebooters. The owners of these privateers were reimbursed for their outlay by the sale of the goods and ships captured from the pirates, and they calculated that they could make a great deal of money, provided they had a fair catch. One company, in which several noblemen were shareholders, asked the governor of New York to recommend a suitable person to command a privateer; and in consequence of his recommendation, Kidd received a commission, signed by the king, and addressed to "the trusty and well-beloved Captain Kidd, commander of the ship *Adventure Galley*."

The vessel thus put in charge of the enterprising William (not Robert) carried thirty guns, was a fast sailer, and had a plentiful supply of provisions, and a crew of about one hundred men. She sailed from Plymouth, England, in April, 1696, and cruised off the American coast for several months. She occasionally entered New York and Boston, where the crew was recruited until it included more than a hundred and fifty men. With this increased force Kidd finally sailed for the East Indies and the east coast of Africa. While on the voyage, he concluded that it would be much more profitable to turn pirate — at least so the story goes; and finding that his crew were not averse to the project, he became a freebooter of the most enterprising character. He captured many ships, and after filling the *Adventure Galley* with gold and diamonds, and all that kind of portable property, he returned, in 1698, to New York. According to tradition, he buried a large part of his treasure on various parts of Long Island, Staten Island, and the banks of the Hudson River, and then boldly sailed

into Boston harbor, under the impression that his royal commission would save him from any charge of piracy. But, unluckily for him, the Earl of Bellamont, governor of Massachusetts and New York, was a stockholder in the Adventure Galley, and was disappointed at the failure to declare a dividend. He had heard of Kidd's indiscretions, and this knowledge, added to the chagrin naturally attending the failure of the enterprise as a financial speculation, caused him to arrest the gallant captain, and send him to London for trial.

At this day there are many persons who believe Kidd was innocent of the charge of piracy, and they unhesitatingly say that he did nothing more than carry out his orders. On his trial, which was most unfairly conducted, the charge of piracy was abandoned, as it was found impossible to prove it, and he was arraigned for killing one of his crew, — William Moore, — in consequence of the mutinous conduct of the latter. It was shown on the trial that Moore addressed insulting language to his commander, and was knocked down by Kidd. The blow, which was delivered with a bucket, proved fatal, and the decision of the court was against the prisoner, on the ground that a bucket was not a proper weapon with which the commander of a ship should enforce discipline. Had he prodded him with a sword, or perforated him with a pistol, he might have been acquitted; but this assault with a bucket was too much. Times have changed since then. At the present day we have the spectacle of the successful defence of murderers, on the ground that the weapons they used were not murderous. I may instance the case of Foster, a conductor on a street railway in New York, who killed Mr. Putnam with a "car-hook." One of the strongest points made in his favor was, that a car-hook is not a murderous weapon. Had Kidd been tried in New York subsequent to 1870, he would have escaped the notoriety he obtained.

There was an interesting performance at Execution Dock, in London, on the 24th day of May, 1701. William Kidd and the executioner performed a duet, which resulted in the death of the former, after an acrobatic exercise of some

fifteen or twenty minutes at the end of a rope. As a warning to the rising generation, and for the amusement of the elders, the ruins of the ex-pirate were left in chains at the end of a gibbet, where they swung in the wind for several years. Pious fathers used to take their sons to look at the pleasing spectacle, and counsel them never to turn pirate, and come to such a rope's end as befell the once well-beloved Kidd. Evidently the warning was effectual, as none of the London youths of that period were able to secure the command of an Adventure Galley, and sail to the Indian Seas. The suppression of piracy as a joint stock operation became unpopular, as it was not found to be profitable.

Many of the incidents narrated in the touching poem, "My name was Robert Kidd, as I sailed, as I sailed," are altogether apocryphal. According to history, Kidd left seven hundred and thirty-eight ounces of gold, eight hundred and forty-seven ounces of silver, and several bags of silver ornaments and precious stones. These were secured by the Earl of Bellamont, but whether they were ever handled by the unfortunate shareholders of the enterprise is not known. The probability is, however, that they were all required for the expenses of the arrest and trial of the pirate.

According to popular belief, the quantity above named was only a small fraction of the wealth acquired by Kidd; and down to the present time people have been searching localities on the New England coast and along the Hudson River, in the hope of finding some of Kidd's abandoned wealth. Tradition has been exhausted, and the chief reliance has been, especially of late years, upon dreams and the revelations of spirits. Almost every year somebody dreams of a locality where Kidd's treasures have been found, and he frequently gets wrought up to such a degree that he sets about digging for a fortune. Thousands of dollars have been expended in these researches, and they have invariably resulted in nothing. It is safe to say that nobody has yet found a dollar buried by Captain Kidd, and it is equally safe to predict that nobody ever will find one. The writer of this knew, in his

boyhood days, of several enterprises of this sort, and though he never dug for Kidd's treasures, he was acquainted with several persons who had been in the business. Some had abandoned it in disgust, and some still clung to the hope that they would one day be successful. They were waiting for dreams and revelations that should indicate the precise spot where they could dig for the iron-bound chest, which invariably contained the wealth they sought. An oaken chest, with hoops of iron, was somewhere concealed, that should one day be theirs.

One garrulous old fellow used to be full of mystery about the matter. His stories were a little incoherent, but I am confident that he firmly believed them, and thought he was telling the truth. He was as superstitious as an Arab, and believed in all sorts of ghosts, hobgoblins, and disembodied spirits in general. One day I happened to see him when he was bewailing his ill luck a night or two before. He had a violent cold, and had swallowed a prodigious quantity of rum and molasses to drive it away. When I asked how he caught it, he became very solemn, took another "drain," as he called it, and then proceeded to a confidential talk.

"Now, boy," said he, "I will tell you all about it; but you must first promise not to reveal my secret."

Of course I made the required promise.

"This was the way of it," he continued.

"One night last week, I dreamed that a spirit with a bright light in its hand came to me, and told me to follow. I followed, and it led me to a place about a hundred yards from the river, where it set down the light, and told me to dig. There was nothing to dig with, but as I looked at the ground, I saw a pick and shovel. I went to work with them, and when I struck the first blow, the spirit went away. I dug and dug, but without getting tired. It seemed that after I had been digging two or three hours, I struck a chest. I could hear the pick hitting on it; and by and by the point of it went through the oak, and I could hear the money rattling. Just then I waked, and found it was daylight.

"Next night I dreamed the same thing again, and then I knew there was something in it. The second time I dreamed it, I tried hard to remember where the place was; and the next day I went up and down the banks of the river, in hopes of seeing it. But I couldn't find it, and what to do I didn't know. It was a revelation, sure, but the revelation wasn't clear enough, and I knew that something else was coming. Night before last it came."

He spoke the last sentence very solemnly, and as he did so, he moved his hand towards a box that stood near his arm-chair. I thought he was about to open it, and show me some of the wealth of the great pirate; but he only produced a fresh bottle of rum, and took another drink. Smacking his lips, he continued.

"Night before last it came. I was out by the swamp after dark. I had been looking for the place, and was just then going home, and thinking I would try it again next morning. I was walking along, thinking, and had my head down, when, all at once, I stumbled over something that made me look up again. And there, not twenty feet away, was the light — just such as the spirit carried in my dream, only it wasn't so bright."

I was about to say, "Will o' the wisp;" but I knew that if I did so, I should put an end to the story, and so I kept silence.

"I couldn't see any spirit, but of course that didn't make any difference, as I knew the light would take me to the spot. I didn't say a word, you may believe, but I looked at the light; and it hung there, looking at me. It didn't move for a minute, and then it began dancing along — not dancing, but sort of waving, like — and moving away from me. I followed it over bushes and logs, and through water up to my knees, and sometimes nearly to my waist, and never once took my eyes off of it. I must have gone half a mile or more, when I stepped into a hole, and fell flat in the water, down among the brambles. The pain was so sharp that I said something, and when I got to my feet again, the light was gone. And that is how I got this cold."

I tried to explain that the light which he saw was nothing supernatural, but he would not listen to my "boy foolishness," as he called it; and after a slight attempt to enlighten him, I gave it up. He recovered from his cold, but kept his dream of fortune constantly in mind. I believe he tried again to follow the mysterious light, and with the same result as before. But his faith was not shaken, and to his dying day he believed he should yet find the buried wealth of Captain Kidd.

According to my recollection, every story told by this man, or any of his associates and neighbors, about seeking for buried treasures, was full of supernatural occurrences; and the failure to obtain the hidden wealth was always attributed to a failure to maintain silence. In this instance my friend attributed the disappearance of the light to his exclamation when he fell; had he remained speechless, the light, in his opinion, would have led him to fortune. Repeatedly I was told of instances where the coveted chest had been reached, and only a few more blows were required to open it. The air was full of unearthly noises, and the diggers were tossed and struck by invisible hands; but they heeded them not, and worked their best. But a blow heavier than the rest, or a sight of the chest, caused an exclamation; when, instantly, the chest disappeared, and the hole which had been dug by human agency, was filled by a supernatural one.

Along the coast of New England, from the end of Long Island to Portsmouth and Portland, there are numerous traditions and other stories of Kidd's treasures. There are those who believe that some of the pirate's wealth is hidden near Lynn and Salem; others locate it near Newburyport; and others, again, near Hampton, Portsmouth, and Kittery. On three occasions I have made summer cruises near these places, and whenever I sought one of these traditions, I generally found it. Places have been shown me where credulous persons have dug for gold and silver enough to make them the envy of all their neighbors; and there is one spot, near Lynn, where a man expended thousands of dollars, trying to make an entrance into a cave, where, as the spirits told him,

treasure of an enormous value was concealed. His money gave out before the treasure was reached; and if it was there then, it remains there now, ready for any one who has money and inclination to prosecute the search.

A party of us, one afternoon, while loitering around Newburyport, fell in with an ancient inhabitant who was a firm believer in the existence of the wealth of Captain Kidd. He knew a great deal more than he would tell — or, at any rate, intimated as much to us when we endeavored to sound him. I will call him Bill Sanborn, as a cover for his real name, which I do not feel at liberty to print. He was a genius in his way, and when we had filled him with rum, and warmed the stiffened muscles of his time-worn frame, he was as talkative as a magpie. He wandered from his subject continually, and it was utterly impossible to tie him down to the main topic of his discourse. He had a son or a grandson — I forget which — keeping a groggery in Boston. The old man had recently been on a visit to the modern Athens, and evidently picked up considerable of the slang of the family bar-room, where he passed his leisure hours. His abilities in the absorption line were extensive, and I hardly dare to say how much he drank, and we paid for, before he was in a proper condition to tell about Captain Kidd. Finally we had him properly wound up, and after singing a few verses of the ancient ballad, with a tremendous emphasis on “as I sailed,” he began.

“I might tell you a good deal about hunting for money, but I won't go and do it, because it might be doing injustice to some folks that ain't dead yet; and I don't believe in that, anyhow. There was Jim Follett and me. We struck a big thing once, and if Jim could have kept his hash-trap shut, we might have had money enough to buy all the rum in America, and keep drunk for ten thousand years. Jim is a good fellow, and likes to have a good time. He'd like to have it on his own money; but he don't have none of his own, and so he has to get other people's, which does just as well. Jim and me are pretty much alike, but I'm more like him than he is like

me. Jim's gone off to Labrador fishing now, or he would be here with us to-day, and if he'd been sucking away at that bottle, he would have been blind drunk by this time, and couldn't move from his chair no more than if he was an anchor.

"Jim and me used to sit around the store up there on the corner, when we hadn't nothing to do. The storekeeper had a dog, a little ornery cross between one cur and another cur, that hadn't no more real, genuine dog blood into him than a sea-turtle. He was a monstrous proud dog though, and used to sit up in a chair and look as serious as a country gal at another gal's wedding. When he had eat a good dinner and was a digesting it, he was pretty good natured; but if he was hungry, or had been kicked, or another dog had licked him, he wouldn't allow no familiarity, not even if 'twas the Emperor of China that spoke to him. He had a funny way, too, that if anybody tetched him round the tail, or sides, or back, he wouldn't bite that feller, but he would bite the man that was nearest to his mouth. For instance, you and me might be a setting here, and Spot — that was what they called the dog — Spot might be laying down atween us, with his head towards me and his tail towards you. Now, if you put your foot down on Spot's tail, that confounded dog would let me have it right in the leg, and the more you put your foot down, the more he'd let his teeth into me, until they met. Lots of the fellers has been chawed by Spot, and the fun of it was, that them which was worst chawed was the ones that hadn't tetched him.

"They got a new parson here once, and one day, when Jim and me was in the store, the parson happened along, and come in too.

"'Fine morning,' says he to us and the storekeeper, and of course we said 'fine morning' to him. He was a meek sort of chap, with a face like a plateful of mashed turnips, and he talked as if he thought divine Providence was easy of hearing, and could understand him if he didn't speak much above a whisper.

"The parson talked round a while, and finally he happened to see Spot, who was a setting up in a chair with his tail sticking out between the rounds, and looking as if he was just going to Sunday school, and was a saying his lesson over to hisself.

" 'Ah, fine dog that,' says the parson to the storekeeper. 'Pears to look very gentle, and very intelligent too.'

"The storekeeper just then had his back turned, and we didn't say nothing. The parson patted Spot on the head, and said, 'Good doggie, good doggie.' Spot was getting ready for a growl, and began to peel his ivories like the ripping up of an old shoe. The parson didn't notice it, and kept on patting him, and said he could always make friends with any dog that he met.

"Jim was a sitting next to Spot, and reached out on the sly, and pinched the critter's tail. Spot made one grab for the parson's wrist, and hung on like a locomotive pulling a freight train. The parson jumped around, howling worse than a cayote, and his mouth was as narrow as a hole in a cast iron letter box. Bimeby the dog dropped off, and the parson went out of the door and off for home, as if he'd just had a call to marry a rich couple that couldn't wait. Jim and me laughed, but the storekeeper was mad, because he was afraid he'd lost the parson's custom. So he talked rough to us and drove us off, and we haven't been there since.

"Jim and me was over to Hampton one time, and loafing around a week or so among the boys. There was a gal at Hampton, mighty smart gal she was, and used to sing in meeting Sundays until you'd think she'd lift the roof of the meeting-house. Some of the young fellers was trying to shine up to her, but she shook 'em all off, and went sweet on a galoot that was keeping school over in the next town. He used to come to see her every week, and he always come on horseback. The Hampton boys sort of hated him, because he was a cutting them out, and so they used to rig up jokes on him sometimes. They'd tie the door of the house where him and his gal was, and once they took a big box and put it

up agin the door, so that when he walked out of the house he walked into the box, just as though it was a front porch. They hid his saddle once, and made him ride home bare-back; and the folks where he kept school said he didn't sit down much for three or four days afterwards.

"The next night after we got there the feller come a courting, and the boys asked us to have some fun with them. The hoss was tied under a shed, and right down the road, about a hundred yards away, there was a big mud-puddle. It run clear across the road, and we could see that when the feller started for home he would have to go right through it. Jim looked the ground over, and told the boys to go and buy a hundred yards of strong clothes-line, and bring it to him.

"When they brought the clothes-line, Jim said to 'em, 'Tie one end of the line to the post of the shed, and tie it strong.'

"When they had done it, Jim says again, 'Now take the line and measure it right out to the middle of the mud-puddle.'

"They measured it, and found that the other end just went to the middle of the puddle. They brought the line back, and Jim coiled it up close to the post, and then tied the loose end to the crupper of the saddle. Meanwhile some of the rest of the boys had got an old cannon out into a field just behind the shed, and loaded it up with a good charge of powder. When everything was ready it was about a quarter to twelve, and we sat down to wait.

"The feller always started home at twelve o'clock, cause the gal's mother wouldn't let her sit up no longer. The old lady said he might stay as long as he liked, but Mary must go to bed. He didn't see no fun in courting all alone to hisself, and so he never staid after that time. Well, just at twelve o'clock we saw the door open, and heard a smack like bustin a cigar box with a hammer. Then he said, 'Good night, dearest,' and he out to his hoss, unhitched the bridle, and jumped on without looking to see if things was all right. He hit the hoss a poke in the ribs, and the critter humped himself at a gallop

straight towards the mud-puddle. The rope was unwinding easy and nice, and neither him nor the hoss didn't know nothing about it.

"When they had got almost to the edge of the puddle, Jim touched off the gun with his cigar. It sounded like a clap of thunder, and the hoss made one jump, and just as he did so he got to the end of the rope. The saddle come off, and the feller with it, and the beast went on as if he was running on a bet of ten thousand dollars, and had put up all the money hisself.

"As the feller tumbled off, he gave a yell that you might have heard fourteen thousand miles away. He thought a streak of lightning had struck the hoss, and that both of 'em was being swallowed up by an earthquake. The gal was standing in the door, and she gave a scream, and ran out and met the feller just as he got up out of the mud, and was making for the house. She got hold of him, and then she fainted, and went down into the ditch by the road-side, where there was a foot or so of water. She didn't stay fainted long; it warn't more than a minute before she was up again. Both of 'em thought it was a flash of lightning, until they got most up to the shed, and we could see them by the light shining out of the house. They was the sloppiest, muddiest looking pair that you ever set eyes on. The feller had on a claw-hammer coat, and the water was a dripping off the tails of it like the Falls of Niagara, and his white trousers was like an old map of Africa, covered all over with black ink for unexplored country. His hat was gone, and his hair was full of mud, and looked like a swab that hasn't been wrung out after washing the floor of a bar-room. If you've ever seen a hen that's been caught in a shower, and got under a cart to get dry, you'll know how that gal looked with her clothes all sticking to her, and she all ready to drop down again as soon as she found a good place. She said she never knew such awful thunder and lightning; and just as he said, 'Yes, dear-est,' they stumbled over the rope, and then they see what it was. He hauled the rope in, hand over hand, jest as you'd

haul in a halibut; and when he got the saddle, and found it tied to the rope, they was about the maddest pair that ever was in Hampton. The gal belonged to the church, and therefore couldn't swear, and the feller couldn't swear cause the gal would hear him, but he said something that sounded mighty like it. They both went into the house, where everybody had got up on account of the noise. The feller staid there that night, but he never come there no more. He seemed kind of discouraged like, and thought there was too many difficulties about courting to make it pay."

The old fellow paused here to take another drink, and then he went on with more anecdotes about Jim Follett and his practical jokes. It was rather odd, or at any rate appeared so to his hearers, that he did not see the least impropriety in giving severe pain and annoyance to those who had offended nobody, and the thought that there was the slightest injustice in practical joking seems never to have entered his head. One of Jim's performances, greatly relished by old Bill, was of the most inhuman character. One day Jim was on the train from Boston, and was to stop at Newburyport. There were but few passengers in the car where he rode, and near him was a woman with a baby. She was going through to Portland, and before reaching Newburyport she placed the slumbering child on the seat before her, and while watching it, fell asleep herself. On reaching Newburyport, Jim, in a spirit of mischief, took the child from the train, left it in the station, and quietly walked away. The agony of the mother on awaking may be imagined. Luckily another passenger had witnessed Jim's performance, and by a vigorous use of the telegraph, the mother and child were brought together a few hours later, after considerable suffering on the part of both.

Suddenly Bill recollected himself, and told us about the search for Captain Kidd's buried treasures.

"One day Jim was down setting some lobster traps, and he wanted something for bait. So he went ashore, and tried to dig clams in a little cove where there was a strip of sand in between the rocks. But there wasn't a clam to be found; and

while he was a setting down, and wondering what to do next, he thought he saw something odd in the hole he had just made. He went for it, and it turned out to be the neck of a bottle; he pulled it out, and there was one of the curiousest bottles you ever see. It looked as if it might have been the bottle that Methuselah used to carry when he was a young bummer and went off on jambarees over Sunday. 'Now,' says Jim, 'I'll take this bottle home and show it to Bill Sanborn;' and sure enough, he did. We busted it and found it empty, and I ought to have said that if there had been anything into it Jim wouldn't never have brought it home without opening it.

"No, it wasn't empty neither. There was a piece of paper in it, a sort of dried-up, old parchment like, with some writing on it. The writing looked as if it was done in the dark by a blind man who couldn't read and was drunk into the bargain. We fussed over it a long time, but couldn't make nothing out of it, and after trying a dozen times, we laid it away and went to bed.

"I fell asleep, and pretty soon I dreamed that writing all out as plain as though it had been printed. I don't remember what it was now, but it told that there was something a hundred and twenty-three yards north-north-east, half east, from a certain rock; and I dreamed the rock out so, that I thought I should know it. Then I waked and lit a candle, and tried the paper again, and found I could read it all straight.

"I waltzed Jim out of bed in no time, and we determined to start off at daybreak. I shan't tell you exactly where we went, and I haven't told you the correct distance and bearings, because I want to try it again some time. Anyhow, we went there, and after a good deal of hunting we found the rock, and found a cross like a big X cut into it. Then we measured off the distance, and took the bearings with a compass we had brought along for the purpose. It turned out that a hundred and twenty-three yards north-north-east, half east, from the rock carried us beyond high-water mark; and as the tide was jest coming in, we couldn't do nothing. We

drove a stake into the sand, though, and concluded to come back and work at night when the tide was out, so as to prevent anybody seeing us. We went and slept as much as we could, and when the night tide was going out, we come back with shovels and picks and pitched in.

"You never seen fellows dig as we did. We made the dirt fly, and we only stopped once in a while to take a drink. We kept our wits about us, and didn't speak a word, as the old folks say if you speak when you are digging for money you won't never find it.

"A little before midnight we were down about six feet, and had a hole large enough to bury one of those dog-house trunks the women take to Nahant. I struck the pick down, and it hit something that sounded hollow. Jim almost got his mouth open to say something, but I motioned him to keep still, and put the pick down again. There was the same hollow sound, and then we went at it for dear life. We dug away and tossed out the dirt, and bimeby I hit the chest with my shovel. When I did that I felt somebody push me first one way and then the other, but I couldn't see nobody but Jim, and he wasn't doing it. I slid around lively, digging all the time, and Jim, too; but it was enough to make your hair turn white to be struck as we were by ghosts, and to hear the air full of noises, but couldn't see anybody making them. They cursed us and screamed at us, but we had expected something of the sort, and besides we was after a fortune. We got some of the dirt off the chest, as it seemed to be, and with it we got some bones of a man.

"How did they get there, do you suppose? I don't know any more than you do; but I've heard tell that when those pirates buried money they left somebody to watch it. They couldn't leave him there alive where nobody lived, and boarding-houses wasn't to be found, and so they used to draw lots, and the feller that got the unlucky lot was just knocked in the head and laid on top of the chest before they filled up the hole. That skeleton belonged to the watchman, and it was him that knocked us around and made such noises in the

air. If he ever wants anybody to say he did his duty, let him call on me and Jim — that's all.

"We'd got out several pieces of the skeleton, and in five minutes more would have been in the chest. All at once Jim was took by the throat by one of them air ghosts, and at the same time a voice called out, 'Leave or die.'

"Jim dropped his pick and yelled 'murder' as loud as he could.

"In less time than you could hold a red-hot nail in your eye without winking the chest sunk down out of sight and reach, the dirt rolled in on us; and if we hadn't got out as quick as we could jump, it would have buried us. And the odd thing about it was, that the bones went in before the dirt did, and settled down jest as they were before we disturbed them. We had nothing more to do. Our fortune was gone, and it was all because Jim hadn't put a big plaster over his mouth so as he couldn't holler."

Here Mr. Sanborn took another drain at the bottle, and suddenly relapsed into silence.

## LXII.

### OUT OF PRISON.

WONDERFUL ESCAPE FROM A FRENCH PRISON. — PLANS OF ESCAPE. — A LONG LABOR. — TUNNELLING THROUGH A WALL. — INGENUITY OF A SAILOR. — LUCKY ACCIDENTS. — DISCOURAGING EVENTS. — HOW SUCCESS WAS ATTAINED. — ELUDING THE GUARDS. — REACHING A PLACE OF SAFETY.

AMONG the most remarkable efforts of prisoners to escape from their confinement was that of some French Communists, who were sentenced to incarceration upon their failure to establish their government in France, after the downfall of Louis Napoleon in the disaster at Sedan. The story, as told by one of them, is of the most thrilling character.

We were political prisoners — three hundred of us — in the fortress of Port Louis, a part of that line of fortifications which was built by Sully to defend the French coast from Brest to La Rochelle. At high tide the fortress is entirely surrounded by the sea, and communicates with the land only by a bridge. Round its circuit runs a rampart on which the casemates abut. The entrance is opposite the bridge — that is to say, facing the peninsula on which stands the little town of Port Louis. On the left are the offices of the prison authorities and the residence of the governor; on the right, the quarters of the soldiers. In the centre of the fortress are barracks, forming a square, and having an inner court; and it is here that the prisoners are confined. The soldiers are strictly forbidden to speak to the prisoners. Their duty consists in mounting guard on the terrace running along above the casemates. A road, known as the Round Road, goes round the citadel, and separates the casemates from the buildings in which the prisoners are confined. The ground floor, occupied by the prisoners, is divided into twenty dor-

(882)

mitories, of unequal size, containing from seven to thirty prisoners each.

The dormitories are lighted by windows looking out on one side on the Round Road, and on the other side on the inner court; and these windows are protected by strong iron bars. Having observed that the floor boards were badly joined, the idea occurred to us of working out with our finger-nails the nails by which they were fastened; and having done this, we discovered under our room large excavations without any outlet, which had doubtless been formed for ventilation. On lifting two of the floor boards under my bed, we were able to descend into this cellar; and then, after working holes in the walls separating the different compartments, we reached the foundation wall abutting on the Round Road. Immediately the working party had descended into the cellar, the floor boards were replaced, and were only lifted again when it was necessary for those below to remount. The only tools we had were large nails or spikes, which had been used in fixing the stand for the arms, these quarters having formerly been occupied by soldiers. We had worked out these nails with our hands; and to do so had cost us several days' labor and no little laceration of fingers. We then conceived the idea of excavating a tunnel to run from the cellar to the sea. We found that we were just on a level with the Round Road; but this road served as a thoroughfare for wagons loaded with powder, and for all the vehicles bringing provisions and other stores into the citadel. It was therefore necessary, before excavating the tunnel, to sink a vertical shaft about thirteen feet in depth, in order that the superincumbent weight of the wagons passing might not cause the road to fall in.

Digging with the nails, we loosened the earth, which we then scooped up in a tin plate which we had been able to conceal. When we had in this manner filled a dinner napkin, we formed a sort of chain, and passed from hand to hand the napkin full of earth, which was deposited in the farthest of the underground compartments and well trampled down,

so that it might occupy as small a space as possible. There were only six of us to carry on this work, for the numberless difficulties which stood in the way of our escape had discouraged the others. We followed to the last the same method of disposing of the earth and the stones, which we worked out one by one after incredible efforts. Having finished this shaft of thirteen feet in depth, we commenced the horizontal tunnel. We had in the first place to pass under the Round Road, which is twenty-two or twenty-three feet in width. As the earth was much easier of excavation than stone, we excavated our gallery with a downward slope, in order that we might be able to pass underneath the foundation wall of the casement facing our dormitory. Thanks to this slope, we succeeded so well that for a space of about forty-six feet—that is to say, until we reached the wall of the rampart—we had only to work through earth. This tunnel was just large enough for one man to creep along in it. We therefore took our turns at the excavations, lying flat on our faces. Unforeseen accidents occurred to increase the difficulties, already great, which we had to surmount. The part of the tunnel passing under the Round Road, notwithstanding the depth below the surface at which it was excavated, and notwithstanding the care we took to construct it arch-shaped, so that it might be better able to support the heavy weights passing above, threatened entirely to fall in. Heavy rains had loosened the soil, and pretty large masses of earth fell every day. It was necessary that this part of the tunnel should be propped up. How could it be done? One of our number, who had been a sailor, and who was a resolute and enterprising man, as sailors usually are, conceived the idea of supporting the earth by packing against the sides of the tunnel the stones which we had removed from the walls. This was done; and the downfall from above being thereby effectually prevented, we were able to continue our labors. A second accident, which seemed at first much more serious, then occurred, threw us into a fever of anxiety, and delayed the accomplishment of our project.

When our tunnel had attained a length of about thirty-three feet, we could not get our light to burn. We thought this phenomenon was caused by want of air, and this is what we did to remedy the defect. While one of our number was kept constantly at work excavating, another, standing in the shaft at the entrance of the tunnel, and making a sort of fan of his jacket, forced a strong current of air into the tunnel. However, after some few days, when the length of the passage had been increased by a little more than a yard, there was no longer any need of our improvised ventilator, as the light burned of itself. There doubtless occurred in this part of the earth some gas which prevented our light from burning; and this gas, having little by little become dispersed, the phenomenon ceased.

At length, after being distracted by doubts and fears, after the innumerable difficulties which every day for three months we had encountered, — difficulties which we should never have overcome but by dint of sheer energy, and thanks to that incredible patience with which prisoners only are endowed, — we reached the wall of the rampart. A few more days of labor and suffering and we shall be free. Free! The reader will understand what courage and hope that word must have given us to induce us to undertake and enable us to accomplish a work which, under any other circumstances, would have appeared to us as simple madness. Alas! it was at the very moment when we seemed to be approaching the end of our fatigues that the obstacles became most difficult to surmount. Some of our number seemed ready to abandon the task which for more than three months we had been prosecuting. All our labor was going to be thrown away. Again it was the energy of the sailor which saved us, and gradually revived the hopes of his weaker brethren. The wall of the rampart which we had still to pierce, and which is, of course, intended to resist cannon-shot, seemed to us proof against anything. It is constructed of enormous blocks of granite, jammed tightly together by smaller stones driven in like wedges, and the whole is united

into one solid mass by means of Roman cement, which has become as hard as the stone itself. We endeavored with the nails — the only tools we had, and which we had put in wooden handles — to loosen the joints of the stones. With another piece of wood we had made a mallet, and to get the wood necessary for these purposes we had broken up the musket-stand and the barrack-shelves.

But the only result of our efforts was to blunt our implements. What could we do to supply our lack of tools? Our first thought was to take away a bar from one of our bedsteads, which were of iron; and this we did. This bar which we took was two feet in length and about as large round as a man's thumb. After using one of the ends of this bar against the stone, we tried what use we could make of it as a lever. But the stones were too hard and too heavy, and our iron bar bent like a switch. What could we do now? We were not disposed to abandon at the last moment a project which had cost us so much toil; and yet we had many times emerged from our tunnel with the skin rubbed off our hands, and our faces as red as fire, having hardly succeeded, after long days of fatiguing labor, in working out a stone about as big as one's fist. At length the bright thought occurred to one of us of making the very things which had been intended to secure our confinement contribute towards our escape. We determined to remove one of the iron bars which guarded the window. These bars were five feet and a half in length, and an inch and a half thick. But, in order that the warders might not perceive that one of them had been taken away, we first of all made an imitation bar of a piece of wood, cut from one of the broad shelves, and which we colored with ink and blacking. When this was finished and dry, we succeeded in unfastening with nails one of the bars of the window. We watched for a moment when the sentinel on the rampart opposite our window had his back towards us, and little by little loosened the stones in which the bar was set. When this was done, taking advantage of one very lucky moment, we gave the bar a wrench, got it

out, and instantly replaced it by the imitation bar of wood. We then took the precaution of stopping up with bread crumbs—which we kneaded so as to look like mortar—the hole made in loosening the bar, and afterwards threw a handful of dust over the whole, that the different shades of color might not betray our device. This bar of iron became in our hands a formidable weapon. Without it we must inevitably have lost all the fruit of our labors. When we were in possession of this formidable tool, as we had now to attack stone, it was impossible for us to continue to work lying flat on our faces, as we had done when it was a simple question of burrowing in the earth. It was absolutely necessary that we should have complete control over all our movements. We were obliged, therefore, before resuming our attack on the wall, to enlarge this part of our tunnel, and to excavate in front of the wall a little chamber high enough for two men to work there on their knees, and large enough for us to use the iron bar to advantage. Of this bar we made, as occasion required, a crowbar or a ram. Then, and not till then, did we make any real impression on the wall. The scraps of information which we had been able to gather from the unguarded talk of the warders had given us a false idea with respect to the thickness of this rampart. We thought it was only about six or six and a half feet thick, whereas in reality it was more than sixteen feet. When, therefore, after indescribable labor, we had worked away the stone bit by bit, and made our hole six feet and a half in depth, we were disconcerted to see no sign that we were approaching the end of our labors. Far from being discouraged by this, however, we redoubled our efforts, and our astonishment increased as the hole became deeper. Still we worked on. The hole became ten feet deep; then twelve feet; then fourteen feet; and it was not until we had dug sixteen and a half feet into the wall, that the man who happened just then to be at work giving a heavy blow to the stone, pierced it, and after being dazzled for a moment by the sudden entry of the light, saw the sea stretching out in front of him. He immediately

stopped up the aperture, and came to impart the welcome news to his comrades. We took counsel together, and decided that our escape should be attempted that very night.

And here I must interrupt the course of my narrative for a moment in order to give the reader a few necessary explanations. "How was it," he will say, "that the officials did not perceive the destruction of the wood-work which you had been obliged to break up to make the handles of your tools, and the bar of wood with which you had replaced the iron bar of the window?" To this question I have a very simple answer to give. The officials of the prison had very little to do with us. The warders never came into our rooms except morning and evening, when they came to call the muster-roll. These visits were made at fixed hours, and I need hardly say that we were always sure to be present when they were made. We took good care, too, to work only in the daytime, for in the silence of night the dull blows struck underground would have been audible above. The warders went from room to room, calling over the muster-roll, and having seen that all the prisoners were in their places, immediately retired without troubling themselves about what might be going on. Besides, no *détenu* wishing to retain the good opinion of his comrades ever spoke to the warders; and these latter, finding themselves thus isolated, sought no intercourse with the prisoners. Again, *détention* being an essentially political punishment, we were not subjected to hard labor, and within the court, as well as in our rooms, were absolutely free. Another question which the reader will have asked is this: "How did you manage to keep your secret unknown during these four months?" Again his curiosity shall be satisfied. There was no secret, and there could not have been any. It was impossible for us to descend into our cellar and tunnel, or to remount to the surface, without being seen by those of our fellow-prisoners who happened to be in our dormitory. The dormitories being open all day long, the prisoners passed freely from one room to another, and by degrees they had all come

to know of our resolution. The majority dissuaded us, and endeavored to point out all the difficulties which stood in our way. Our project seemed to them an absolutely impossible one. They thought that, our work having lasted so long, the officials had got scent of it, and were letting us go on, because they intended to have soldiers stationed ready to shoot us when we attempted to make our escape. We allowed our comrades to talk thus, and only asked one thing of them — that they would not betray our project. This they all promised, and, as the reader will see, they kept their word. I must, however, add that we had deceived them as to the time of our departure. When they inquired as to the condition of our work, we carefully guarded ourselves from revealing the stage at which we had arrived. Several times I gave them to understand that our work would not be finished before the end of January; and on the very day when everything was finished, we had given no sign of our approaching departure until we were about to set out. We had nothing more to do but to enlarge the hole we had made in the day, and to get out through that aperture.

The rampart which we had pierced is on the left of the citadel, and therefore faces seaward. When the tide is low the sea retires and leaves the rocks dry for a distance of sixty or seventy feet around. On the night of our escape the evening muster-roll was called as usual, and we were shut up in our dormitories. Almost immediately two of our number went down to complete the enlargement of the hole, and this labor occupied them two hours. On their return we informed our companions that the moment for our escape had arrived. Their emotion was certainly greater than ours. Before setting out we took the precaution of placing in our beds our bolsters, made to look as much as possible like a man's body, and with our night-caps stuck at the top. We also spread our prison clothes on our beds, as we were in the habit of doing every evening. Our object in adopting these precautions was to deceive the warder when he came in the morning to call over the muster-roll. The stratagem suc-

ceeded, and the officials did not know of our flight until six o'clock the next evening. This was very fortunate for us, as otherwise we should not have been able to get away any great distance from the citadel, and we should infallibly have been retaken. It was the 14th of November, at nine o'clock in the evening ; the tide was out, and the rocks at the foot of the rampart were left bare. We had been able to find out the times of the tides in the almanac at the canteen. Our precautions had been all carefully taken, and, thanks to the depth of the shaft we had sunk at the entrance of the tunnel, and to the slope given to the tunnel itself, the hole which we had made in the wall of the rampart was only ten feet above the rocks.

One after another we crept through the tunnel, and then getting through the hole in the wall, we were able, while still clinging with our hands to the wall of the rampart, to reach with a drop the rocks beneath. Then, following all the bends of the wall, and keeping as near to it as possible, we passed around to the land side of the fortress. In like manner we passed along over the beach, keeping as near as possible to the little town, situated about one thousand yards from the fortress ; and thus at length, after creeping silently between the huts of the coast-guardsmen, we reached the dry land opposite a little village called Loe Malo. The tide was now coming in. It had been our intention to divide, as soon as we were clear of the fortress, into two groups of three men each, only six prisoners having ventured to escape. We, however, marched on together, and without resting during the remainder of the night, in order, as quickly as possible, to put as much distance as we could between us and the fortress. Our object was to reach some little port of Brittany, and then endeavor to take ship for England. When we were brought to the citadel the authorities had caused us to be minutely searched, and had not left any money in our possession. I had, however, succeeded in concealing a small sum by carefully sewing it into the lining of my coat. This money was of the greatest service to us, as it enabled us on

the following morning to take the railway, and thus in a few hours to put a considerable distance between us and the citadel.

After marching all night, however, through a drenching rain, if we had presented ourselves at the railway station as we then were, our appearance would have excited suspicion. We had taken the precaution of bringing with us from the prison shirts, brushes, blacking, and, in short, everything necessary to our toilet. In a place of concealment we carefully brushed up and dressed ourselves to the best of our ability; and when, at daylight, we presented ourselves at the railway station, we were clean and tidy, and appeared to have come from some place very near. I had brought a book away with me from the prison, and this I carried under my arm to give myself the look of a traveller. On our way to the railway station we saw three *gendarmes* running towards us, gun in hand. Without faltering we walked coolly on, and the *gendarmes*, as we came up, politely stepped aside to let us pass. We took the train for a small port in Brittany, and in the evening succeeded in getting on board an English vessel. We were saved!

## LXIII.

### PRIZE-FIGHTING.

**DECLINE OF THE SPORT. — HOW TO ARRANGE A FIGHT. — AN AMATEUR ENCOUNTER. — THE MANAGERS AND THE WARRIORS. — HOW THE FIGHT WAS ARRANGED. — THE LOCALITY AND THE SPECTATORS. — AN UNFORTUNATE MOUTH. — NEW USE FOR POSTAGE STAMPS. — DESCRIPTION OF THE FIGHT. — DODGING THE POLICE.**

UNTIL the whole nature of the human race is changed there will be disputes between men, and also, on occasions more or less rare, between women. The higher the development of the contending individuals, the more is it probable that the disputes will be intellectual in their character, and brain will take the place of muscle. Where the disputants are ignorant and uneducated, their contentions will be of the physical order, and brain will play a secondary part. Mr. Froude and Father Burke do not agree on the Anglo-Irish question, and their warfare has been of a very earnest character, but it has been entirely of the brain. But let the same question arise between a London cadger and a laborer from Tipperary, the intellectual would be subordinate to the physical, and the decision would rest upon a trial of strength between the high contending parties. The platform, in the case of Burke and Froude, becomes the ring where the other supporters of their national honor are brought forward; the reporter's pencil takes note of the words uttered by the intellectual warriors, and the same pencil takes note of the blows exchanged between the Liverpool Slasher and the Dublin Mouse. While Lord Clarendon and Mr. Seward were exchanging notes of twenty columns or less on the subject of the Alabama claims, Coburn and Mace prepared to settle our national question in another way; and it is worthy of remark that in neither of the

(892)

two contests did either party admit itself vanquished. Give the heroes of the prize-ring the mental power and development of diplomats and philosophers, and prize-fighting will be heard of no more. John Morrissey does not fight, now that he can keep a gambling-house and go to Congress; and whenever a New York pugilist becomes an alderman, he retires at once from the ring, and devotes himself to the more worthy improvement of the mind and pocket. He reads the daily papers, blackmails contractors, and on rare occasions he may go to church. The ways of the wicked are no longer his, because they are not altogether profitable; and, moreover, they hold out an unwelcome prospect of the State Prison. He is a man of intellect, and finds brain-work better rewarded than the labor of the fists. 'Tis education forms the common mind, and also reforms it. Give us universal education; make every man among us read and write, and inspire him with an ambition for something higher than mere physical glory, and the professional pugilist will become a thing of the past.

The decline of prize fighting in this country and England is one of the sure signs of national progress. Japan is advancing, if we may judge by a recent decree of the Tenno, which commands that actors and wrestlers shall, after three years from this time, engage in honorable employments. Two hundred years ago we were wont to regard actors and pugilists as much alike; but we long since recognized the intellectual character of the actor, and assigned him the honorable place which he deserves. Japan has confusedly caught at the essence of our civilization, and confounded old forms with the new. Doubtless her law-makers will be instructed by time and diplomats, and before the three years of probation are ended, she will rescind that part of her recent edict that condemns her Booths, her Jeffersons, her Forrests, and her Broughams to herd with her Heenans and Coburns. The ring was once an institution of England; but Parliament has laid its heavy hand upon it, and by a series of enactments has given a severe blow to the whole disgraceful business. Parliament needs now to educate the masses of the English people,

in order to complete the work. In this country the states have, one after another, made laws for the suppression of pugilism, so that those who would despoil each other's features by an appeal to their strength are compelled to make a sharp race with the officers whose duty it is to preserve the peace. The ring has fewer admirers year by year, and consequently fewer allurements. If we can ever, in this free country, compel every citizen to have an honorable employment, we shall make a long stride towards the desired end.

Though less numerous than of yore, the devotees of "science" are sufficiently abundant in New York for all practical purposes. Of great "battles," like those between Heenan and Morrissey, Coburn and McCool, Edwards and Collins, there have been none for some time, and I am informed that the prospect is not brilliant for the years to come. The last participants in a noted prize-fight were rewarded with six months of prison life, and naturally their ardor has been somewhat dampened. I do not think they are half as eager for the fray as they were, and one of them has publicly announced his intention of fighting no more. The professors of the art lament the degenerate days, and many of them realize that the march of events is going directly over and above them. Several who formerly devoted their time and talents to the instruction of pupils are now in active pursuits, such as keeping grog-shops, robbing passengers in street cars, and occasionally "cracking a crib," i. e., burgling a store. Now and then small and obscure fights are arranged; but they must be kept very secret, in order to avoid the police, and they are generally between amateurs rather than professors. The stakes on such occasions are small — from five to fifty dollars; and the combatants must be careful not to get their names in the papers, otherwise the police are likely to take them in charge. Their glory must be circumscribed to the circle of personal friends and spectators, and they cannot hope to go down to posterity through the medium of printer's ink. Full many a gem of purest ray serene the dark, unfathomed caves of ocean bear; full many a plug is born to box unseen, and waste his science on the desert air.

I have a friend who reads Buckle and Fichte, attends the lectures of Tyndall and John Fiske, and knows by heart all the brilliant passages of Macaulay and Kinglake. He is up in French and German, and I have heard him discuss Teutonic metaphysics by the hour with professors from Heidelberg and Jena, who spoke nothing but the language of Wilhelm. Rather oddly, he was a captain in one of the Zouave regiments formed here in 1861, and afterwards rose to the rank of major. In the service he became acquainted with many of the "fancy" that went to the war, and he has kept up his acquaintance with such of them as the tooth of time and their own bowie-knives and revolvers have left. During the war it was his custom to offer rewards to his men for good behavior, and he found that the most taking thing in the reward-of-merit line was a prize-fight. Sunday morning, after divine service, he used to say, "Boys, behave yourselves well this week, and you may have a prize-fight next Saturday."

The boys would give a cheer, and through the week they were as demure as an orphan asylum. Along in the middle of the week the happy combatants would be chosen by lot, and very proud were those on whom the honor fell. The men were trained till Saturday, and then the fight came off in grand style, the officers generally making up a purse for the warriors, and having reserved seats inside the ring. Then the boys were in their glory. The defeated, and frequently the successful fighter went to the hospital a week or so, and everybody was supremely happy.

Occasionally, nowadays, when a small encounter is coming off, the major backs the strongest man, and gives him an opportunity to earn ten or twenty dollars in a pounding that most of us would refuse if it brought a million along with it. He associates occasionally with the broken-nosed and low-browed fraternity, and with the same sort of familiarity that he displays when discoursing Hindoo mythology with a fellow-disciple of Ralph Waldo Emerson. He reads the *Journal of Speculative Philosophy*, and when he has perused its last line he turns to the *Clipper* and *Bell's Life*. His library is stocked

with well-thumbed works on mental and moral philosophy, and in his back yard he has a couple of bull-dogs and half a dozen game chickens. If pugilists and wrestlers could be bred like horses or goats, I have no doubt he would have a stable full of them, and take great delight in exhibiting them to his friends. No pent-up Utica contracts his powers; his study of science is the most comprehensive I ever knew.

One day the major called on me, and after exhibiting a rare volume of Sir Isaac Newton's works, which he had just purchased, he asked if I would not like to make a contribution in the cause of science. I assented, and the major explained:—

“Buck Maginnis, one of my friends, has a couple of pupils in art whom he wishes to bring forward at a private view. Buck says they are very skilful, and anxious to eviscerate each other, and that he has no doubt they will acquit themselves nobly. Several gentlemen whom I know would like to see them, and I have thought it might be agreeable to you to join us. We will make a little party of a dozen, and throw in five dollars apiece. Half the money will go for rent of the studio, and the other half will make a nice purse for the two artists. Buck says they are poor and worthy, and thirty dollars will be a great prize for them. I proposed to make it fifty, but Buck thought that would be too much, as it might induce them to kill each other, and it wouldn't be pleasant to have a dead man on our hands.”

The major further explained the nature of the affair, and in the interest of science I consented to go. The time was fixed for the following Saturday evening, and we were to rendezvous at the Metropolitan Hotel, which is conveniently near to Houston and Crosby Streets, the favorite haunts of the scientists.

The major said it might be well to leave my watch at home, or to drop it into my trousers pocket, and if I had a valuable diamond pin he would advise me not to wear it. “Not that I fear any trouble from my friends,” the major explained, “but we might fall in with a strange party that wouldn't make any nice distinctions.”

Soon after I reached the rendezvous, the major came, and

the different members of the party were made acquainted. The major said we had not long to wait, and drew from his pocket the following note:—

“DEAR MAJOR: To make everything suire Conkey has gone round to have the crib ready, and get the plugs there. Me and Conkey will bee at the hotel by half past ate.

“Yours,

BUCK MAGINNIS.

“7:30 p. m.”

Promptly on time came Buck and Conkey. They were well dressed, and rather flashily so, especially Conkey, who flourished around in a shiny overcoat, as proud as an organ grinder's monkey in a new suit. Buck was sparkling in a watch chain that might draw the Dunderberg up a marine railway without risk of breaking. The major privately informed me that Conkey was a burglar by profession, a sort of boss burglar, who put up jobs for the journeymen in the business to perform. “But I wouldn't say anything to him about it,” hinted the major, “as he is a modest man, and appears to-night in his capacity of gentleman. He is negotiating for a gin-mill on Water Street, and if he gets it he will retire from his present business, though he may keep up a sort of silent partnership in it.”

We were presented to the two worthies; they were introduced as Mr. Maginnis and Mr. Conatty, though the major addressed them familiarly as Buck and Conkey. We were careful to apply the handles to their names whenever we spoke to them, and one of our party went so far as to address Conkey as Dr. Conatty, in consequence of the information derived from the major that Mr. C. was a skilful demonstrator of anatomy, and had used the bowie-knife on several occasions with an adroitness that elicited the applause of every beholder and the vigilance of the police.

The new comers were treated to drinks,—they did not belong to any temperance society,—and while they were drinking, I had an opportunity to survey them. Their hair

was cut close, and their mustaches were brief; both their noses had been broken, and one of Conkey's eyes was somewhat discolored, the effect of a recent discussion. Buck had lost the upper half of his right ear by a bite from an opponent several years ago, and the front teeth of his lower jaw had disappeared. The deficiency was supplied by some false ones, which he wore when he entered the hotel; but in the course of animated conversation they become inconvenient, and he removed them to his vest pocket. Both were entirely civil, and there was something deferential in their manner. "I used to know you," said Conkey to one of our party after the drinks were ingulfed, — "I used to know you when you was editor of the ———. I knowed you when I first came in, but I didn't say anything, because I thought you might not like me to speak to you." This was considerate on Conkey's part, and he appeared pleased when assured that he ought not to have any such hesitation, and that his old friend was delighted, and even proud to meet him.

Very soon we started, the major taking my arm, and explaining as we went along that the affair was all fixed, and would be as private as possible. "There will be a dozen or twenty roughs there," said he, "enough for seconds, bottle-holders, and the like, and a few friends of the warriors to see fair play. They will choose a couple of umpires, or empires, as they call them, and a referee. They may want one of us to act in the latter capacity; but as it is the general custom to shoot the referee when he makes an unsatisfactory decision, the office is not a desirable one. When he decides in favor of one man, the friends of the other are apt to manifest their dissent in a most emphatic way, and it is impossible for a referee to please both parties."

At the corner of Houston Street Buck called a halt, and suggested that our party should divide into three squads, as its size might cause it to attract the attention of the "peelers," as he called the police. We divided accordingly, Buck leading our squad, the major another, and Conkey the third. We went by different routes, and were soon gathered at an

establishment where spirituous liquors are vended to such as have the stomach for them, and a very powerful stomach it must be. The place had been closed at an early hour, ostensibly for repairs; and when we reached it there was only the faintest light visible above the barred and bolted door. We were cautiously admitted, and soon after our arrival the warriors and their friends presented themselves. There was a large room at the rear of the bar, and here the fight was to take place. A stove stood in its centre, but this was speedily removed, and the floor was sprinkled with sawdust. The proprietor, known as "Dusty," busied himself preparing two large bowls of water, arranging the corners to which the debaters were to retire, bringing out a couple of fresh lemons and the necessary towels, kerchiefs, and sponges for use during the fray. In a little while all was ready, and Dusty ordered the men to strip for the contest. A mark called the "scratch" was drawn in the sawdust, and when this was done our attention was drawn from the preparations and concentrated upon the parties present.

The major and his friends were seated on chairs, ice-boxes, and barrels on one side of the room. The ends were used as "corners" for the pugilists, and on the side opposite us there was a fringe of dirty-looking fellows, with brutal faces, short necks, broad shoulders, and hair about the length of that on the back of a rat. The two performers in the art of manly disfiguration were short, strong fellows, with the same general aspect before they were stripped as the others. When their coats and shirts were removed — they wore no vests — there was a marked difference in their appearance. One was rather thin below the neck, and evidently much less powerful than the other, whose flesh was thick, and gave him almost an appearance of fatness. Probably there was a difference of twenty pounds in their avoirdupois, but Buck whispered that what the small one lacked in weight he made up in strength and science. Their names were not given; they were represented to be 'longshore-men, and out of regard to their connection with marine matters, we called the larger the Walrus

and the smaller the Sculpin. They had not arrived at the rank in the profession which entitles them to a stage name. Future years may know them by the titles with which they have been christened on this occasion—titles which may go to posterity along with the Chicken, the Mouse, the Buzzard, the Slasher, and the Benicia Boy.

Dusty unfastened the rear windows, and said that if the peelers disturbed us, we could escape by the windows into an alley, by which we could reach the street, and then “cheese it” for our own cribs. Then he took his watch, and standing at one end of the scratch, called out, “Make ready!” The warriors had been stripped to the waist, and their coats thrown over their shoulders. Each had two seconds with decidedly bull-dog features, and it was whispered that one of the seconds on each side had an honorable place in pugilistic fame. The chief second of the Sculpin was called Keno; the names of the others I failed to obtain. Keno had whipped his man on several occasions, and we deeply regretted that he could not be killed for our amusement on this occasion. It was intimated that he will appear, some time in the coming season, in a fight with another light-weight known as the Bull Dog, and that a brilliant encounter may be anticipated. One of our party proposed to start a discussion with Keno on the merits of the spectrum analysis, as applied to the measurement of the actinic rays in the beams of the moon, but refrained from so doing when it was suggested that he would be likely to view a series of stellar constellations before the end of the debate.

Dusty called out, in a powerful voice, “Make ready! Shake hands!”

Walrus and Sculpin advanced to the scratch, and shook hands over the (about to be) bloody chasm. The seconds shook hands at the same moment, crossing them over those of the principals, so that there were six fists in a bunch in the centre of the space between the two opposing groups. This ceremony over,—and there was as much etiquette in it as in the salutations in a quadrille,—the two groups retired

to their respective corners. "Time!" shouted Dusty, and the principals came forward to the encounter.

The left arm, with a doubled fist at the end, was held in front of the body, about two inches from it, and a little above the level of the elbow. The right arm, from the shoulder to the elbow, was held pretty close to the side, in a perpendicular position; while the other half was projected forward in nearly a straight line from the body. The men stood about two and a half or three feet apart, and made a variety of feints with their fists, and at the same time moved slowly from side to side, so that they seemed to be measuring off a circle. Pretty soon they struck out at each other, and quickly recovered, without doing much damage. Then they repeated it, and "closed"—that is, they were in the attitude of embracing; but instead of making a hug of affection, they pounded each other's head to the best of their ability. Half a minute of this was enough, and then they clinched and fell, Walrus being underneath.

As soon as they fell, they separated, the rule of the science being, that a "round" ends when the men drop to the ground or floor. The seconds then came forward, and those of each warrior carried their man to his corner. The carrying is literal, the men being lifted, not quite as tenderly as infants, but with as much care as possible, so that they shall not expend their strength in walking. The Sculpin always lay perfectly still, and allowed his seconds to carry him; but the Walrus usually rose to his feet, and walked to his place. I observed that in doing so, it was his custom to rest his fist, with the weight of his body upon it, in the stomach of Sculpin, thereby seriously impairing the breathing powers of the latter gentleman, and leading to a call of "foul" by the Sculpin's seconds. Dusty was master of ceremonies, umpire, and referee, all in one; and after Walrus had played this trick three or four times, Dusty intimated that a repetition of the offence would award the fight to Sculpin. Walrus was also accused of biting Sculpin on the shoulder. He denied the dental practice, but I am constrained to believe that the accusation

was not altogether an aspersion upon his hitherto unsullied character. He appeared deeply hurt by the charge, and averred that his heart bled at the thought. Possibly it did, but so did Sculpin's shoulder.

The seconds bathed their men with sponges, fanned them with towels, washed their faces, rubbed their arms and legs, and did what they could to strengthen them during their minute's rest. A freshly-cut lemon was squeezed upon the men's tongues, with a reviving effect, but no liquor of any sort was given them. It is expressly forbidden, by the rules of the prize ring, to give stimulants to a pugilist during the course of a fight. When the shoulder-hitters are in training for a grand battle, they are put on a most careful diet for several weeks, and sometimes for months. All kinds of spirituous liquors are forbidden, and the same is the case with tobacco in every form. Vinous liquors are also excluded from the list of permissible articles; tea and coffee go with them, and the only drink allowed to the patient besides cold water is a limited quantity of old ale. The greatest care is exercised over the diet, oat-meal in various forms being the principal article of food. The man is required to walk, run, box, and exercise in different ways, the object being to reduce all fat, and strengthen the muscles. When the fight comes off, the man is in fine physical condition,—able to endure the blows of his adversary for a long time, and also to give a great many blows without becoming exhausted. It is this sort of training that enables a pugilist to fight three hours or more—as is sometimes the case—and “come up smiling” at the beginning of every round. The life of the pugilist while in training is of the most exemplary sort, barring a slight extravagance of language; and it might be advisable for government to arrange a series of daily prize-fights throughout the year, as lotteries are drawn in Kentucky, so that all the pugilists in the country should be in perpetual training.

Sculpin needed more bathing and rubbing than Walrus, and his seconds were more attentive to their man than were those of Walrus. Keno had a mode of refreshing his principal that

attracted attention, if not admiration. When the latter was seated, and undergoing the chafing of hands and chalking of shoes, Keno filled his (not Sculpin's, but his own) mouth with water, and then spurted it in fine spray into Sculpin's face, very much as I have seen Chinese laundrymen sprinkle linen preparatory to ironing it. When time was called, and Sculpin rose to resume his part in the debate, Keno spurted a second mouthful over his principal's shoulders, so that they shone like a flitch of bacon. Walrus had an unknown second, who had been wounded in a recent fray, his mouth being cut and extended an inch or two from one corner towards his right ear. The gash had been sewed up, and fastened with plaster, and he was getting along very well; but it was not allowable for him to talk much, and laughing was altogether forbidden, lest it might tear his mouth open afresh, and give it the appearance of an extension-top buggy. In a moment of excitement, he dropped an involuntary exclamation that parted some of the fastenings of the artificial portion of his mouth, and rendered a surgical operation necessary. There was no sticking-plaster at hand, and the situation was serious, until one of our number came to his relief with a half sheet of postage stamps. The unruly potato-trap, as the pugilists denominated that facial opening, the mouth, was calked and fastened in a manner unknown to star-eyed science; a handkerchief was tied under the chin and over the skull of the patient, to batten his jaws well together, and he became thenceforth a dumb waiter upon his friend, the Walrus. The postage stamps speedily became soiled, and gave him the appearance of a foreign letter that has passed through half a dozen distributing offices, and been duly stamped in each.

The seconds and the pugilistic part of the spectators were evidently disciples of the Darwinian school, to judge by the frequency with which they ascribed the origin of their principals to the canine race. Their terms of endearment and encouragement were generally of this sort, and they were repeated with great frequency and energy, until they became monotonous. The use of an affectionate phrase of four words

was almost universal, and seemed equally appropriate in encouraging friends and denouncing opponents. A bystander, who was a personal friend of Walrus, took advantage of an occasion when the combatants, in clinching, fell near him, to plant his boot in the side of Sculpin, by way of helping the other. This was not the proper thing, and he received a gentle reminder to that effect. Dusty, who was standing near, and saw the operation, turned quickly around, and planted a couple of blows in the face of the interferer that knocked him into a corner, six or eight feet away, and doubled him up like a slumbering armadillo. Dusty did not look to see the effect of his blow, but continued at his duties, as though nothing had happened. The stranger rose slowly, and for the rest of the entertainment he was as quiet as an oyster, and formed one of the most demure wall-flowers ever seen.

With rounds varying from twenty seconds to three or four minutes in length, and ending in knock-downs, clinches, and falls, the fight went on for nearly an hour; when we suggested that they had better stop it, and allow the contestants to divide the money. Neither of the twain was badly hurt; though Sculpin had a few gashes on his face, and a bloody nose, while the breast of Walrus presented a gash that might have passed for a sampling cut in a side of beef. We had seen all we wanted, and were ready to go home, satisfied that pugilism is a brutal and brutalizing business; and the sooner it is forever ended, the better for the human race. We left the place as quietly as we came, Conkey going ahead to see that no policemen were waiting to take us in. The affair had been managed so cautiously that there was little fear, though you can never tell what the police will do; and a night in the station-house is not a cheerful subject of contemplation. Three or four years ago, a party of members in an up-town club (since dissolved) arranged an entertainment of this sort, and at the appointed time started for it. They told some of their friends where they were going, and after they had started, the friends thought it would be a good joke to have them

"pulled" by the police. Word was sent to the police headquarters, and the friends then decided to go down town, and witness the pulling operation. Now, it happened that the fight did not come off, and the first party, after waiting a few minutes at the rendezvous, dispersed. The second party arrived there just ahead of the police, and were waiting on the steps, and talking rather loudly when the latter came. The result was, that the police took them in, marched them to the station-house, and kept them until next morning. They were let off with a reprimand and the consciousness of having been shorn while in pursuit of wool. They tried to keep the joke secret, but it could not be kept, owing to its superlatively excellent qualities.

## LXIV.

### DIAMOND AND OTHER SWINDLES.

THE GREAT DIAMOND SWINDLE OF 1872. — HOW IT WAS ORGANIZED. — MAGNIFICENT PLANS OF THE SWINDLERS. — PLANTING A DIAMOND FIELD. — HOW THE FRAUD WAS EXPOSED. — A NEAT SWINDLE ATTEMPTED IN SAPPHIRES. — HOW IT WAS DISCOVERED. — A MYTHICAL COPPER MINE. — FATE OF THE SWINDLER.

THE great diamond swindle of California will probably go down in history as one of the most magnificent frauds of this or any other age. There are some facts about the matter which have not yet been given to the public. When the operators first started their "plant," they went to New York, and endeavored to enlist capitalists in that city. A friend of mine was thrown into contact with them, and from him I learned the points. They wanted half a million dollars for their claim. He looked at the diamonds, which appeared to be genuine, and he was allowed to apply the usual test of rubbing with steel files and with emery. They stood the test, and he offered to put ten thousand dollars into the scheme. Another friend (a friend of my friend) came forward, and as he had some money to spare, he was allowed to investigate the business; the twain were prepared with more files and emery, and they rubbed more of the diamonds.

The test was going on satisfactorily, when my friend, whom I will call Sharpley, happened to lay hold of a stone that yielded to the hard substances against which it was brought. Sharpley tried another side of it, and again it yielded. He was handling a piece of common crystal, and not a diamond, and his eyes were beginning to open. He became inquisitive enough for a son of Paul Pry, and the result of his question-

(906)

ing was, that he didn't put his money into the speculation. Straightway he sought his friend, and actually found him arranging to draw the check that would have made him a twenty thousand dollar stockholder in the great diamond mine of Arizona.

Sharpley talked to him like a Dutch uncle, and with some difficulty induced him to withhold the money for the present. I say with difficulty, for Sharpley's friend had become as enthusiastic over the diamonds as a damsel of sixteen over her first beau, and was determined to go in anyhow. He half suspected that Sharpley wanted to keep others out so that he could get more stock for himself, and subsequently, when the stock was all taken, he upbraided Sharpley for keeping him out. He does not upbraid much now, but, on the contrary, quite the reverse. When the exposure came out, he thought how his twenty thousand dollars had been saved, and remembered that Sharpley had been the cause of its salvation. He sent a basket of the best champagne to Sharpley's office, and it was while drinking a glass of the beverage that its recipient told me of his diamond experience.

"It was one of the best laid plants I ever saw," said Sharpley, "and if it had not been for stumbling on that piece of crystal, I might have been taken in. They tried to explain to me that the crystal got in there by accident; but as they had previously told me that every stone in the collection had been examined by an expert, I knew there was a lie somewhere. They had a few rubies, which they claimed were found in the same locality, or near them. I looked at them, and was allowed to take one of them to a jeweller, who pronounced it genuine. That night I overhauled my encyclopædia, and studied up the character of diamonds and rubies.

"I found that the diamond consists of crystallized carbon, while the ruby, sapphire, and all that class of gems, are crystallized alumina. Next morning I went to one of the best geologists in New York, whom I happened to know well, and asked him if crystals of carbon and alumina could be found in the same locality.

"'Most certainly not,' was his reply. 'Such a thing may be possible, but I doubt it very much.'

"'What would you say,' I asked, 'if a man showed you a diamond and a ruby, and told you they were found side by side?'

"'I should ask him if he knew the man that put them there; and if he insisted that they were natural deposits, I should change the topic of conversation for fear of saying something to wound his feelings.'

"I left the professor," continued Sharpley, "and made up my mind to have nothing to do with the speculation, although I confess I was greatly puzzled. Apart from the statement of the geologist, and the discovery of the crystal which first caused my suspicions, everything appeared right enough. The parties were respectable, polite, intelligent, and wanted a good price for their property, or rather for half of it, as they only desired to obtain money to work their claim. They would not reveal the locality of the discovery, as it was upon unsurveyed ground, and they desired the passage of a bill by Congress to confirm their title to it. The *mesa*, or diamond-bearing ground, was minutely described, and was very much like the diamond-bearing localities of Brazil and India. Professor Janin, a scientist of repute, had been there, and staked his reputation on the genuineness of the discovery. He was sworn to secrecy, in order that there should be no jumping of the claim by the adventurous fellows who abound on the frontier, and to keep off everybody, in fact, until the proper title was secured, and the company was ready to go to work. Several persons who had investigated the matter as extensively as they could, were convinced of its correctness, and were ready to invest.

"Furthermore, the operators were anxious to get the claim to their land, and spent money to get it. General McClellan, Samuel Barlow, and others went into the operation, and you may be sure they don't risk their money unless things appear pretty certain. McClellan, Barlow, and the rest, whom I will call the New York party for the sake of convenience, offered

four hundred thousand dollars for the half interest, and had the money ready to put up. I surely expected the 'planters' would take this and clear out, as they would then make a handsome profit on the speculation. But they refused it, and, as they could get no more, they took up their bags of diamonds and went away. This again made the thing look genuine, and I was more puzzled than ever. I began to wish I had put in my money, and it was then that my friend, whose champagne I am drinking, blew me up for dissuading him from investing. I soothed him, and we determined to keep our mouths shut, and wait for what would turn up.

"Well, to shorten up the story, the planters went to San Francisco and got Ralston, and the rest of them to go in. When the company was organized, the New York party began to regret not having taken the thing at half a million, and they felt so bad about it that they asked the Ralston crowd to let them in on the bed rock organization. They urged the time, money, and influence they had used to get the grant from the government, and begged so hard that Ralston's party finally gave them a chance. They won't tell how much they lost, but I think there were five of them stuck for about twenty thousand apiece. There were other small fry, but they were not of much account.

"Now, there is another thing that hasn't come out yet, but I am sure it will one of these days. There is a rich deposit of diamonds on this continent of North America, and some of the stones which have been exhibited came from it. Some of the diamonds used in getting up this plant were bought in London, and came from Brazil and South Africa, but there were others that certainly came from no diamond fields yet known. At least that is what some of the experts say, and if all the parties interested in the purchase of the Arizona mines, — I do not mean those who sold, but those who bought the half interest from the swindlers, — if all these parties were catechized searchingly, I have reason to believe that some of them would or could tell something that would be quite as startling as the original story of diamonds in Arizona.

They had already taken steps to secure this new locality before the Arizona swindle was exposed, and had it not been for the sudden death of a gentleman connected with the negotiations, the business would have been completed ere this. The negotiations were hindered by his death, and it may be months before they are completed; but you can certainly look for a revelation some time in 1873 of great interest concerning diamond fields of wonderful wealth."

"Why," I asked, "did not the Arizona swindlers get up their speculation on the real diamond fields of which you speak? They could have made more money, and avoided the stigma of dishonesty which they must bear as long as they live."

"Simply because the swindle was much the easier thing. The real fields are practically inaccessible, except to a large and well-armed party, and under the sanction of another government than our own. A concession to hold and work them must be obtained, and this would take a long time. I will say this and no more—that they are north of the Isthmus of Darien, and are not in the United States. You may guess about their locality as much as you like, but for the present I can say nothing more. You see it was much easier to get up an excitement about Arizona or Colorado, and turn it into money, than to wait and work on the genuine enterprise. Men are not generally inclined to dishonesty unless they can make something by it."

So endeth what I have to say about the diamond swindle.

Some other transactions of a kindred sort have come to my knowledge, and they may properly be told in this connection. A few years ago I was interested in the study of crystallizations, and made some experiments in the laboratory of a chemical friend. We tried a long time to get up rubies and sapphires, and followed the processes of Ebelman and Gaudin as closely as possible. Artificial crystals of alumina have been produced, but they have always been so small as to require a microscope for their discovery, and any attempt to color them has failed. In the course of our experiment we

**DREAMS OF A DIAMOND SWINDLER.**

came in contact with a scientific gentleman of considerable repute. He assisted us in some of our efforts, but we never succeeded in them, not even producing the smallest crystal. Finally, we gave up the enterprise, and turned our attention to something else.

Three or four months later I met this scientist, Professor Blank, in the corridor of the Astor House. He was delighted to see me, and said he had called two or three times on business of importance, which he could only explain at his rooms.

We made an appointment for that evening, and he went away.

I was on hand at the appointed hour, and, after carefully locking the door, the professor became confidential.

"You remember your experiments to produce sapphires," he said, "and you also remember that I took great interest in them. When you were disheartened and gave up, I did not abandon hope, and at last I have been rewarded. I have produced a perfect sapphire by following another process from yours. You used alumina and boracic acid; I have been using the same things, but have added another acid, and an oxide that gives the color to the stone at the same time that it facilitates the crystallization. Here is the result."

As he spoke he opened a table drawer, and from a small box produced three beautiful stones. Apparently they were sapphires of correct shape, color, and density, and worth a great deal of money. They reflected the gas light, and for a short time I saw a fortune before me. When I had examined them thoroughly and placed them on the table, the professor continued: "Now, these are sapphires made in my laboratory — just as Nature has made them in hers. They are of the same material as the natural sapphire, and a man can sell them for genuine stones and not be guilty of any fraud."

I assented to his proposition.

"Here is a fortune in my secret; but to make the secret available, it is necessary to proceed with great caution. The instant it is known or suspected that the stones are made by an artificial process, the market will be ruined. I have

thought the whole thing over, and determined upon a plan. We will form a small company, the fewer men in it the better, and fit up a laboratory in connection with a tin shop, or something of the sort. The shop will be a blind to prevent suspicion, and the laboratory can be in the rear, where we will pretend to have a new process for soldering tin. When the stones are made, we can put them on the market slowly, and sell them just fast enough to prevent getting up a panic."

He went on with the details of his scheme, which was plausible enough, only it was a trifle too large. Had he been an adventurer, I should have suspected him at once; but here was a scientific gentleman, whose name was on the title page of a book that had been received as an authority, and, so far as I knew, his reputation was without blemish. I was captivated by the brilliancy of the enterprise, and readily consented to join him and bring the matter to the attention of some of my friends. He wanted about twenty thousand dollars for a share in the secret, and as capital wherewith to set up and stock his proposed laboratory. To wind up the evening and leave me fully convinced, he opened a crucible, which, he averred, he had that afternoon taken from the furnace and laid away to cool. From the black mass of slag at the bottom he extracted a couple of sapphires, smaller than the ones he had previously shown me, but as perfect in every way as the others. My mind was nearly but not quite made up. I asked the privilege of taking one of these latest sapphires, and also one of the others, to show to a friend whom I wished to join me in the speculation.

The professor consented, with the injunction that I must not reveal the secret of their manufacture, and that I should be very cautious about exciting the suspicion of any outsider as to their artificial character. "We must be very careful," said he, "not to let the dealers know that the stones are not dug from the ground, like all others in the market. They are in every respect the same, but the question of demand and supply tells more readily on precious stones than on anything else that men deal in."

Next morning I jumped into an omnibus and rode down town. I went to a lapidary on John Street, with whom I had a slight acquaintance, and at once showed him my sapphires. He looked at them just an instant, and asked what I wanted to know about them. I asked what he called those stones.

"Well," he replied, with a smile, "they are very good imitations of sapphires."

"Imitations!"

"Yes, imitations; I ought to know, for I made them myself."

A gigantic flea at that instant—a flea as large as an elephant—entered my right ear, and jumped about like a school-boy exercising across a gutter. The lapidary continued, that he made the stones to order, and three others at the same time, about a month before, but declined to tell me for whom they were made. They were made of strass, a fine article of glass, consisting mainly of potash, oxide of lead, borax, and silex. Nearly all artificial gems are made of strass, and the colors are obtained by adding certain oxides while the substance is in a state of fusion. Diamonds, sapphires, rubies, and amethysts, made of strass, may deceive a novice, and even be made so skilfully as to require a careful test before deciding on their character; but you can no more sell them for genuine to a regular dealer than you can make a butcher buy a poodle under the belief that it is a bull-dog.

I returned the gems to the professor that evening, with the brief explanation that my friend was averse to a speculation on account of a lack of funds, and that an unexpected development had rendered it impossible for me to invest. He did not press for an explanation, and we separated with mutual regrets.

Another time a man who had been for several years on the Pacific coast came to New York, and lived a month or two at my hotel, without any appearance of business. I formed an acquaintance with him one day at the table, and found that he was a good talker, and well informed on mining matters. Our acquaintance ran on a week or so, and one day he invited

me to his room, and showed me some specimens of copper ore. They were of wonderful richness, and while I was looking at them he explained that he knew where there was a vein six feet wide and a half a mile long of just such ore. He said it in the most careless way imaginable, and remarked that he thought he had about as good a thing as there was going.

I thought so, too ; and after a few minutes' conversation we separated. Nothing more was said for several days, when finally he asked if I knew anybody who would like to join him in working the mine and sharing the profits. There was more than he wanted for himself, and he would like to be relieved of the trouble of looking after it. The mine was on the Colorado River, in Lower California, and was a very easy one to work. I took some of his samples of ore, and showed them to a speculating friend, who said, " This is a wonderfully rich ore, and there is no end of money in it, if he is talking the truth. It is worth looking into, but we must be cautious."

Ten of us formed a company, and agreed to pay him a hundred thousand dollars for a half interest in the mine, if it turned out as he represented. He described it minutely, over and over again, and his story appeared perfectly plausible. He was ready to go there with any of us, show us the property, and satisfy us that he had told the truth. We sent one of our number to California with him, and at San Francisco a couple of gentlemen, to whom we had written, joined the twain, and made a party of four to go to the copper mine. All the way he talked about the mine — from New York to San Francisco, and from the latter city to the Colorado River. Several copper mines had been opened in that region, and he spent a day escorting the party among the reduction works of these companies. Up the banks of the river he led them about twenty miles from the last of these mines, and then acknowledged that the whole thing was a deception, and that he had no mine to sell.

The two Californians proposed shooting him on the spot; but the New Yorker had a prejudice against shedding blood, and persuaded his friends to let the scoundrel escape. He

did not return with them, and he never reappeared in New York; but he did turn up in San Francisco, where he sold for ten thousand dollars (and obtained the money for it), a quarter interest in a mine to which he had no more title than I have to a township in the moon. He was a plausible wretch, and could look you straight in the eye while telling a lie as big and as plump as the swelled head of an Irishman the morning after a wake.

I believe he was subsequently mistaken for a coyote, and shot by a miner whose claim he had been endeavoring to steal and sell. The miner regretted the mistake, or, at all events, said that he was sorry that somebody else had not made the mistake, and made it earlier.

### PERQUISITES.

**CURIOSITIES OF COMMERCIAL TRANSACTIONS. — PAYING COMMISSIONS IN EUROPE. — FUNNY EXPERIENCES. — SPREAD OF THE CUSTOM IN AMERICA. — HOW CONTRACTS ARE OBTAINED AND PAID FOR. — COMMISSIONS TO TRADESMEN AND OTHERS. — CURIOUS FEATURES OF THE PIANO TRADE.**

AMERICAN travellers in Europe frequently express astonishment at the commission system which prevails there among all classes of people. From the moment you land on European soil till the moment you leave it, you are the subject, or rather the object, of commissioners of every possible variety. I do not refer to the parties who expect and require you to pay money for direct services, but to those who make money out of you in an indirect way. You step on the dock at Liverpool or Havre, and an officious porter takes you in charge, and hands you over to a cabman. You pay the porter for his services, and think that the money you give him is all he receives. Not a bit of it. The cabman gives the porter a commission on the money which you pay for your ride, and very often this commission is a heavy one. Instances have come to my knowledge wherein the porter or servant engaging a carriage was paid twenty-five per cent. of the fare; and I once looked from a door-way in Rome, and saw the cabman give my *valet de place* exactly half the money which the former had received from me; and I had paid him only a few cents above the regular tariff. The couriers, or travelling servants, receive a commission on the hotel bills of the tourists whom they accompany, and also a commission on nearly all their bills of whatever sort. If you make purchases in shops, it will very likely make a difference of five or ten per cent. in

your bills whether you are accompanied by a courier or valet. Some of these fellows are constantly urging you to go to shops where you are likely to buy something, and very ingenious are the devices by which they wheedle you, or endeavor to wheedle you, into buying something. The shrewdest of them pretend to be your friends, and take your part with a great deal of vigor. I have in mind a valet that a party of us hired, one day, to show us the sights in the vicinity of Naples. We thought he was a capital fellow, as he was exceedingly earnest in his efforts to save us from the grasp of the swindlers. There were many sights to be seen, and consequently many fees to be paid; and he took especial care that we did not pay too much. A custodian would demand four francs for admitting the party to the special curiosity in his charge. "Two francs is the proper charge," our conductor would say; and if the custodian persisted in his outrageous demand, our guardian would threaten to erect a dormer window on him. We, of course, would pay the two francs, and rejoice that we had not been defrauded. We learned, next day, that one franc would have been sufficient, and that the extra franc was divided between the custodian and our valet. He made a nice day's work of it, as he received, in addition to his hire and commissions, a present of five francs from us for his fidelity. When we returned to the city, he took us to a coral store, but declined to enter, as he feared the proprietor would take advantage of us on account of his presence, and charge an extra sum, on pretence of expecting to pay commission. We learned afterwards that this was one of the tricks of the trade. It made us more willing to purchase, as it threw us off our guard; and no doubt the storekeeper and the valet had a laugh over the circumstance when the latter received his commission. For ways that are dark, and for tricks that are not in vain, commend me to a courier or a *valet de place* in Europe.

Sometimes this universal practice of giving commissions leads to funny experiences on the part of travellers. In 1867, the year of the Exposition, it was my fortune to be in

Paris, and to see the capital in its gayest and most prosperous times. Every Parisian, in whatever business engaged, was counting upon making a fortune, or, at all events, upon laying a broad and solid foundation for it. Prices were exorbitant; trade was brisk, and money was plenty. For had not the foreigners come from all parts of the globe, with abundance of cash, which they were scattering as the farmer scatters the grain he sows? The police came to the relief of the much-defrauded public; but though they regulated the cabmen and other public personages, they could not regulate the shopkeepers. Merchants would coolly demand a hundred francs for an article worth no more than twenty, and when you taxed them with an attempt to swindle, they explained that they must live, and that rents were very high. One day I found a small spot of grease on my hat, and stepped into a hat store close by the Grand Hotel. The shopman examined the hat for at least a minute, and then sent for the foreman of the work-room. The latter came, and the twain held a solemn consultation, that resulted in a proposition to eradicate the obnoxious grease if they could have three days' time, and at an expense of twelve francs. I declined, and walked out. The same afternoon, at a small hat store in the Latin Quarter, the stain was removed inside of ten minutes, by the use of a hot iron; and the whole work cost but half a franc.

There were lots of Americans in Paris at that time, and the most of them did not know enough French to swear in, much less to make a purchase, or order a breakfast. They used to fall upon such of us as knew the language, and compel us to act the part of valets in accompanying them on shopping tours. Very soon we were utterly sick of this amusement, and used to invent all sorts of excuses to be rid of it. One day I had some fun that lasted me a week at least, and was a standing joke, which several of my friends enjoyed hugely. A gentleman and lady of my acquaintance induced me to accompany them to a shop on the *Rue de la Paix*, where I was to act as their interpreter in some projected purchases. I was the go-between in the transaction, and faithfully ren-

dered the English of the patrons into the French of the shopkeeper, and *vice versa*. The purchases amounted to nearly three hundred francs; the goods were wrapped, and the money was paid over. My friends were taking a final glance into the show-cases on one side of the shop, while I was looking at something on the other side, and holding, by accident, my open hand on the counter. The shopman slipped a twenty-franc piece into my hand. His action surprised me for an instant; but I speedily comprehended the situation, closed upon the coin, and then took a sly glance at it. "*Dix francs encore*," I demanded, in a whisper, and shook my head. There was a look of expostulation on the face of the merchant; but I repeated my demand, and received the extra ten francs. We left the shop, and I kept the occurrence to myself until evening, when I narrated it, in the *café* of the Grand Hotel, to a little group which included the gentleman whom I had accompanied. He was boasting of the cheapness with which he bought his articles that day, and recommended the shop as the most honest one in Paris. Then I came out with my story, and produced the identical money received from the dealer in *bijouterie*. The champagne which was bought with those thirty francs proved to be a very good article, but somewhat high priced, though no more so than the like material which my patron was obliged to purchase as soon as my commission was expended. He did not hear the last of that affair for some time, nor did I.

The foregoing is a prologue to a few remarks — rather a long prologue, I admit — upon the fraud of this custom of giving commissions in America. How long it has existed here, I do not know. Quite likely the fellow who negotiated the sale of Manhattan Island for twenty-four dollars, in the days of Hendrick Hudson, received a commission for his services; and it may be that the ministers who surrounded Ferdinand and Isabella, and persuaded them to listen to the daring Genoese navigator, and favor his project for a new route to the Indies, received a commission from Columbus as soon as the money for equipping his fleet was secured from the king and queen.

History records that the Mayflower was very poorly equipped when she sailed with the Pilgrims for Plymouth Rock, and that the contractors who furnished her did not comply either with the letter or spirit of their agreement. If the matter could be investigated, I have little doubt we should find that the contractors were obliged to pay a commission to somebody, and that they found it so heavy as to take away all their profits, and compel them to the dreadful alternatives of being dishonest or losing money by the operation. At any rate, this is frequently the case nowadays, and I have known a man to be pressed so sorely by the commission-seekers that he found a contract, originally supposed to be very fat, to turn out so lean as to be no better than a skeleton. Particularly is this so with matters connected with the city government in New York.

In the days of the Ring, a man would seek, we will say, a contract for paving a certain number of streets. He would pay a member of the Board of Aldermen to introduce a resolution authorizing the said pavement. Then a committee would be appointed to investigate the matter, and the committee would need something to help support their families, and also to secure a favorable report. Next it would be necessary to interview a sufficient number of the members to make a majority, and then the resolution would go through. The same course would be followed with the Board of Assistant Aldermen before the resolution would become a law of the city, and enable the pavement to proceed. And when the work is finished, there is trouble about getting the money for it. First comes the inspector, who is to pronounce upon the work, and say whether the terms of the contract have been met. His salary is small, and his expenses are large. He is the head of a numerous family, and is required to contribute to the success of his political party; and such success requires money. A judicious salve of greenbacks spread over the contract enables him to see as he should see, and he reports favorably. Then come the Board of Audit, Supervisors, and the like. They may not all need money; but there are

certain members and *attachés* who are poor, but dishonest, and are struggling manfully against the floods and storms of this wicked and weary world. Delays are dangerous and vexatious, and to secure expedition and favorable action, there is nothing so good as money. And then there is the work of getting the money after the payment has been ordered, and very often somebody in the financial department of the city and county of New York will demand and receive his commission. Then there are outside bills to persons of influence, and when one has been settled, another and another will make its appearance.

I have made no fancy sketch. This is the history of many a contract—probably of most of the contracts—with the city government of New York in the past twenty-five years. And it is for this reason that such exorbitant prices are paid for paving, street cleaning, and all other city work; and it is for this reason that many contracts which appear exceedingly profitable on their face, really furnish little or no profit. I have known several men who had large contracts on which they actually lost money, and I have in mind one who was driven into bankruptcy by a contract out of which he expected to make a large amount of money. He had calculated upon a shave of fifty per cent., and made his terms accordingly. But his actual proceeds were only twenty-two per cent. of the face of the contract, and even for that amount he was compelled to wait so long that he could not meet his outstanding bills, and became a financial wreck. Other city governments may be bad, but I think none of them are equal to that which has its scene of operations on Manhattan Island. I leave out of the case altogether the forgeries and raised bills of the Ring operators, and consider only those contracts which may be classed as strictly legitimate.

There is a good little story which is told of a noted hotel-keeper, whose name I will not mention, though there are dozens of New Yorkers who can give it, and can vouch for the correctness of the narrative. Some years ago there was a foreign embassy here, and the city government showed many

attentions to it. Our Boniface obtained from the Board of Aldermen an order for a grand dinner to the embassy, and a splendid affair it was. The bill was about three times what it should have been; but Boniface was a good fellow, and agreed to divide with the aldermen if they would put it through. They did so, and, what was more, they ordered the immediate payment of the money. It was paid; and Boniface sent word to the members who had befriended him to come to the hotel at a certain hour, next day, and he would do the handsome thing. They came promptly, every man of them, and were assembled in one of the parlors. Boniface was among them, with a greeting for everybody, and he poured out his wine in the most liberal manner. He was a good talker, and kept them amused with his wine and his stories for a full hour or more. But time was pressing, and some of them hinted that they had better end the business, and separate.

"Don't go yet," said Boniface; "take some more wine."

They took it, and hinted that they came for the divide.

"Take some more wine, boys; I'm going to do the handsome thing."

"But that divvy, Bonny," urged one of the party. "We can't stay longer, as we have a meeting this afternoon, and it is almost time for it."

"Boys," said the hotel-keeper, "I've just ordered a basket of this wine for each of you, and you will find it at your houses when you go home."

"Hang the wine! We want that money, and that's what we came for."

"Now, boys," said Bonny, seating himself in an arm-chair, and smiling till his mouth resembled the entrance to a railway tunnel, "I suppose you'd call me a d—d skunk, if I went back on you, and didn't hand over a cent."

"Of course we should," said half a dozen, almost in unison; "but we don't think you'd do that."

"Well, that's just about the size of it," he replied. "I've got the money, and mean to keep it. You may have all the

wine you want, but I'm not going to corrupt you with money, and you may call me what you d—n please. Have some more wine, boys; have some more wine."

The boys were in no mood for drinking just then. They went away sorrowing, and they all cursed him in all the epithets known to the language. It is even said that they offered liberal premiums to anybody who would invent fresh forms of swearing, so that they could speak their minds fairly. Common profanity wouldn't do.

Few persons have any idea of the extent of this commission business in ordinary affairs. I mean those unconnected with politics. It would be difficult to name any branch of business where commissions are not paid to somebody. Lawyers give commissions to those who send them clients; doctors pay those who recommend them to patients; grocers, butchers, bakers, and candlestick makers pay commissions to those who send them patronage; tailors, milliners, haberdashers, confectioners, florists, bar-keepers, taverners — in fact, nearly all persons who buy, or sell, or fill orders, are obliged to pay commissions to somebody. Railway companies, steamship companies, and dozens of other corporations — reputed to be without souls — pay commissions, and will continue to pay them to the end of time. Even undertakers are not exempt. I know of two cases wherein they have paid for the business which came to them, and have heard of several others. One that was told me a few weeks ago was as follows: A woman in a fashionable boarding-house died suddenly, and her husband asked the landlady to send for an undertaker. She did so, and the job proved a good one, as the bereaved husband was possessed of considerable money, and wished to do the thing up in style. He told the undertaker to make the funeral a swell one, and not to stand on expense. The undertaker obeyed orders, and the affair was the envy of the remaining boarders in the house. A day or two after the payment of the bill, the landlady called at the coffin shop, and quietly hinted that a death in a house is a sad thing, especially in a boarding-house. The undertaker assented,

and without further parley drew a check for fifty dollars, which consoled the unhappy matron, and turned her sorrow into delight. When another boarder dies she will not forget this slight testimonial of the undertaker's respect and esteem.

Many a nice young man about town is clothed free of expense by fashionable tailors who have an eye to business, and know it is to their advantage to keep the much viewed swells in fine garments. Grocers, butchers, bakers, and all men of their ilk, pay commissions to house servants much oftener than their employers imagine. The custom has become very general in New York in the past few years, and in some households the wages of the servants are the smallest part of their incomes. On New Year's day the grocers send presents to the servants, generally a bottle of whiskey or gin to each cook or kitchen maid, and the result is, that, in a good many houses, the servants below stairs, on the first day of January, are quite as drunk as the majority of the visitors and entertainers in the parlors above. At the railway and steamboat landings, the hackmen frequently pay commissions to the policemen who allow them good places in the line, and do not press them to move on. Policemen, by the way, make a great many commissions—when their consciences are flexible—from gin-shops, gambling-houses, and other establishments which may as well be nameless, and in the same way hotel clerks and hackmen are enabled to add materially to their regular incomes. The hotel clerks come in for commissions on the tailors, and the same is the case with others who come in contact with strangers. For example, there is a tailor in New York who is understood to have friendly relations with one of the consulates,—I don't mean with the consul, but with some of the subordinates. When a foreign traveller drops into this consulate, and says, "I want some clothes, you know, and I want to know, you know, where I can find a good tailor, you know," some one is moved to say, "My dear fellow, you know, go to ——'s; here's his card; awful nice tailor, you know; will just suit you, my boy." The traveller

goes, and remarks to the tailor that they told him at the consulate that this was the place. Is it anybody's business if somebody gets the handsome thing done for him?

There is one trick in the business which has been adopted by many people, but the point of it is rarely seen by the victim. It is that of giving a letter of introduction by way of holding a tighter grip on the party to be skinned, and also of avoiding a dispute as to the validity of the claim for a commission. Jones, from the country, is stopping at the Bangup Hotel, and asks the clerk to direct him to a good, respectable gambling-house, or something of the sort, as he is a stranger in town, and doesn't know the ropes. Clerk tells him, for instance, that Heenan's or Morrissey's is just what he wants, and draws from his pocket a card, on which is printed the name of the clerk of the Bangup. Then he writes on the back thereof, "This is my particular friend, Mr. Jones: treat him kindly; show him every attention, and charge it to me." "Be sure and hand him this card," the clerk enjoins; "otherwise he won't know you, and won't show you any more attention than anybody else." Jones delivers the card, is treated politely, and often leaves a hundred dollars or so in the house, and is satisfied. So also is the clerk when he receives his share of the proceeds.

A few years ago there were two hotels, one in New York, and the other in a western city, which were run in a sort of half-way partnership. Suppose you were a patron of the New York concern, and were about going to the other city: mine host of Manhattan would say, "Let me give you a letter to my cousin," and forthwith he wrote a warm letter, in which you were represented as a particular friend,—you will always find a "particular" in the letter,—one of the best of men, a gentleman in the true sense of that word, and one whose acquaintance would be an honor of which the President of the United States and the Emperor of Russia might be proud. You would be deserving the highest respect, and should receive the very best the house could afford.

You took the letter,—I have seen several of them,—and

went to the house named in it. I never knew anybody who received any special courtesy in consequence, but he generally found his bill from twenty to fifty per cent. higher than it would have been had he brought no introduction. The two hotels played that game a long time before travellers found them out, and it was astonishing how long it took to discover the trick. A friend of mine once arrived here from the hotel at the other end of the line. I met him at the dock, and urged him to go to the house where I lived. "No," said he, "I have a letter from —— to his cousin here, and I am going to that hotel. Just look at that letter." I read the document, which was one of the most fulsome things you ever saw, and would clearly entitle my friend to canonization. He went to the hotel, was politely received, crammed into a room under the eaves, and about as large as a cigar-box; could not get moved lower down, though they promised every hour that they would transfer him on the next; and after staying there four days, left in disgust, with the additional affront of a bill, in which there were all real and several erroneous extras at the highest possible or impossible rates. The real wording of that letter should have been, —

"This is one of our patrons; stick him in anywhere, and charge him all you can."

I presume the business that pays more commissions than any other is that of making and selling pianos. In the first place each large establishment usually keeps a man to write its advertisements and look after its business relations with the press and advertising mediums generally. One manufacturer, a shrewd foreigner, is understood to employ one of the musical critics, who not only prepares pamphlets and advertisements, but devotes his criticisms as far as possible to the interest of his master. Then, most of the distinguished pianists who come here are each paid by some one of the manufacturers to toot for his piano. If you look at the programmes of these piano concerts and recitals, you will generally see a line announcing "The Muggins piano is exclusively used at this concert, and recommended by Herr Ivorypounder." One pianist, now in this

country, was brought here by a piano maker who guaranteed forty thousand dollars for a six months' tour; and another foreign pianist, now here, has a similar guarantee of twenty thousand. It is safe to say that half the noted foreign pianists are imported by the piano makers, and that half the rest are engaged and subsidized by the makers soon after they get here. Then, most of the concert tours are backed by the piano men; and I know several instances in which they have been directly organized by them. They may lose money on the tour itself, but they make money out of the extra sales of pianos. Then they are obliged to pay commissions to music stores and to music teachers who recommend their wares and effect sales, and frequently to persons totally unconnected with musical matters, such as upholsterers, carpenters, and friends of the families where pianos are bought. I know an instance wherein a man who was paying attention to a young lady received two hundred and fifty dollars from a piano dealer for turning the attention of his loved one from the instrument of Stiggins to that of Wiggins. He accompanied her to the store, where she made her purchase; her papa sent his check next morning, and in the afternoon her dear Charles Augustus called for and obtained his commission. And he is not the only society man, by a long way, who makes something out of the piano dealers.

The daughter of a wealthy citizen not long ago wanted a piano, and the wealthy citizen told her to select one. The house was undergoing some repairs and alterations, and the carpenters and upholsterers were at work there. Maria was taking music lessons, and appealed to her teacher for advice; the latter recommended a Muggins, and in the course of a week or so the piano was bought and sent home. The teacher was suddenly called out of town, and did not visit Muggins until ten or twelve days after the purchase. When he asked for his commission, Muggins told him it was already paid.

"To whom?" was the question, with emphasis of astonishment.

"To Reps & Co., upholsterers."

"What right had they to it?"

"They came here next day after the piano was sent home, and said they were upholstering the house, and were consulted about a piano. They recommended mine as specially adapted to the house, and said it was bought through their influence. I paid them the commission. Since then the carpenters have been here, and now you make the third applicant. I am sorry it has happened so, but take a check for fifty dollars, and whenever you influence another sale, let me know at once."

The music teacher was badly sold, as it afterwards turned out that Reps & Co. did not know a word about the piano till they saw it in the house. Had he been as sharp as some others of his profession, he would have notified each of the piano makers, as soon as Maria broached the subject, that he was trying to sell his piano, and then, no matter whose make she selected, he would have obtained his honestly earned commission.

## LXVI.

### BORROWING AND BORROWERS.

HOW THE BUSINESS IS PROSECUTED IN NEW YORK. — THE NUMBER OF BORROWERS. — THEIR DIVISIONS AND SUBDIVISIONS. — HOW THEY OPERATE. — THE STORIES THEY TELL. — THEIR ENERGY. — ABILITY TO READ CHARACTER. — SUFFERINGS OF THEIR VICTIMS. — FRAUDS UPON HORACE GREELY. — DEVICES TO AVOID THESE SWINDLERS. — ANNUAL AMOUNT OF THEIR SWINDLES. — HOW A MAN CUTS HIS EYE TEETH.

MONEY is the motive power of the world. In executive capacity, it is an angel or devil. By it civilization must be measured, and all accomplishment wrought. A material blessing, it is the parent, too, of such an amount of spiritual comfort as may not be reckoned. Money will buy everything but health and affection ; and, through its aid, the one is protected and the other provoked. No marvel that men worship money ; it is the strongest of secular deities, the firmest of supporters, and the staunchest of friends. Nobody can live without it ; it is life itself. Every one must and will have it in certain quantity, either by fair means or foul. Every community is composed of borrowers and lenders, and the former are always in stupendous majority. They who have most lend least ; and, consequently, borrowers are brought to depend on the class widely removed from prosperity.

The number of men who subsist upon others by persistent fleecing can scarcely be estimated. They abound in this country, especially in New York, which may well be called the haven of the hard-up, and the blissful seat of the professional borrower. All roads lead to New York ; all swindlers and adventurers journey thither in expectation of finding victims. Their anticipations are generally realized, and

they bless the stars which have guided them to monetary Manhattan. They come by every boat and train, from every state and nation, with devices, plans, and pretexts for genteelly defrauding that colossal goose known as the Public.

Fortunes are so much more easily and quickly made here than in any other city, that the borrower, whatever his calling or his clime, is tempted to visit us because confident of his reward. Europeans often wonder at the carelessness of Americans in respect to money, and are astounded when told that, in this Western land, the chief requirements for procuring loans without security are falsehood and effrontery. They cannot understand how it is possible for hundreds and thousands of men to live by politely robbing others, and yet keep up an assumption of honesty and respectability. Aware that such things could not be in the old world capitals, they are surprised at the opposite order of affairs over here.

It would be extremely interesting to know the amount that this community is swindled out of annually, not only by its own citizens and people, but by foreigners of every grade. I venture to affirm, that there are almost always here from twenty to twenty-five thousand persons whose principal business it is to filch from the purse of whomsoever they can. Borrowing is their exclusive profession. They have reduced it to a science, and arranged it as an art. They have a certain genius for imposition, a dramatic power of misrepresentation, a fecundity of invention which would have inured to their great advantage in some honest calling. But of honesty they will have none; preferring to wheedle, falsify, and plunder by the niceties of manipulation and the subtleties of deception. These professional borrowers are of divers degrees and countless types, though their end is continuously and persistently the same.

The normal mind would suppose that borrowing is the hardest way to get money; that earnest and honest work of any kind would be much the easier of the two. But the mind of the professional borrower is abnormal. Having no clear conception of truth, justice, or advantage, it sees life at

an extremely obtuse angle. It may have been healthful at first, but it becomes diseased by continued violation of integrity, and finally ceases to have cognizance of its own operations.

Money is often called, and generally seems to be, a vulgar commodity, which generous souls ought to be above considering. The mere possession of money may not be, and indeed it very rarely is, either refining or ennobling; but to be without it, begets unhappiness, opens the door to temptation, provokes a tendency to disesteem, if not to degradation. Nothing is so demoralizing as to be under material obligations that cannot be discharged; and when these obligations are voluntarily and continually assumed, he who assumes them grows to be, ere long, a sycophant and a slave.

“Beware of debts!” is an excellent motto for secular guidance, and its conscientious follower will, in the long run, thank his stars for its adoption. To owe is to be owned, to surrender individuality, to lose independence, to forfeit self-respect. The debtor soon parts with his sensibility, and waxes callous. His course winds downward; at every turn he is forced to do greater violence to his natural self and the cause of truth. Eventually, he becomes a worse offender than those the laws punish; for he is an enemy to society whom society has no power to confine.

The metropolis is infested with so many and such different borrowers, and they are so much a part of the community, that they may be divided and subdivided into classes.

The first class is composed of those who, being in business, draw largely on the future at a venture, but with the expectation of paying in due season. They are usually hopeful, even sanguine, though less prudent and conscientious than they should be, and more considerate of themselves than of others. These men turn their confidence and audacity to profit, provided fortune favors them; but if she be adverse, they go down, and drag their lenders with them. They rise again, however, in new fashions for borrowing, and once more challenge circumstances to do their behest. If they

win at last, they boast of their energy, perseverance, and courage, and despise men who have been more conscientious and less lucky.

The second class have legitimate callings, but substitute credit for capital. They borrow largely without concerning themselves in regard to liquidation. They are not positively, though they may be considered negatively, dishonest. They will pay if they can conveniently; but if they cannot, they refuse to fret, resigning their financial burdens to those compelled to bear them. They have the support of an easy selfishness, and when their creditors complain, they invite them to be patient, and wait for the day of judgment.

The third class shift from one occupation to another, and in every shifting are liable to deterioration. Half the time they are out of business, but they are always going into something new that promises admirably. They dwell in to-morrow, and defer the fulfilment of all their engagements to that uncertain fragment of time. They borrow right and left, careless of whom, never reckoning the amount they have taken or the covenant they have made. They will pay if they are dunned; but if not, they will scatter their obligations with their breath. After a certain range of experience in effecting private loans, they learn that many persons would rather suffer loss than ask for a return of money, and they take advantage of this sensibility. They fortify their want of principle by affirming that a debt is not due until demanded, and they always pretend to forget what it would be unpleasant to remember. They are poor in performance. They invariably want extensions, and regard to-day as if it were non-existent. Catch them with a full purse, and represent your right to a part of its contents, and you may count upon payment long deferred.

The fourth class are constitutionally dishonorable—the impersonation of selfishness. They have no intention of paying, even at the time of borrowing, and never will pay so long as they can avoid it. They talk a good deal of their integrity, for the express purpose of imposing upon their

hearers. They consider every man a potential creditor, and try to influence him to that end. They are good for what they pay cash for. Their word ranks with their bond, and both are worthless. They can be depended upon to meet their obligations only when compulsion is employed.

The fifth class are still worse ; for they not only regard borrowing as a virtue, but they deem payment a vice. To defraud anybody seems to give them a positive pleasure, and they never felicitate themselves so much as after a successful swindle. They are earnestly opposed to discharging any and every obligation, however sacred the circumstances under which it is contracted. They are among the very few of their kind who would rather throw away money than pay a debt with it ; and a creditor whom they have been obliged to satisfy, they reckon ever after as an enemy. By some perversion of understanding and derangement of morals, they have come to believe that the world's goods belong to the most ingenious swindlers, and that they are entitled to such distinction. This class seldom have any position, commercial or otherwise, but prey upon the public without mercy.

The sixth class, so far as known, have never done anything but borrow. They are the most professional of professionals. Their only idea of property is to get whatever they can without an equivalent. Work is hateful to them, and fraud delightful. They struggle hard for the reward of dishonesty, and receive it with a feeling akin to enthusiasm. They have never had the slightest credit ; and how they contrive to dupe their fellows, year after year, is one of the mysteries of humanity. Physiognomy and manners proclaim against them ; and yet they accomplish such results through dishonesty as upright men would vainly strive for by honorable means. Continual practice renders them perfect in the art of cozening. They are able to espy a loan in a face as a banker is to detect alloy in coin. They appear to have an intuitive knowledge of the contents of an unseen pocket-book, and of its owner's special weakness, which they proceed at once to play upon ; they can get money out of a

hunks, and have been known to raise the wind in the dead calm of a millionaire.

These principal classes include subdivisions too numerous and diverse to mention. Borrowers change their grade as they advance in meanness and recklessness. They may begin in the first rank and fall to the lowest. They will do this year what they would not have done last. They are always liable to sink, even below the level they occupy. They require a broad field for operations, because the proper victims cannot be gathered twice by the same hand. They droop their crest as they accumulate infamy, and exercise more and more hypocrisy and deeper and bolder falsehood as their career continues.

Borrowers roam the island of Manhattan from morning to midnight, invading every place and penetrating every corner. They can no more be shut out than the Atlantic Ocean; they are all-pervading, persistent, and resistless. They will climb to the apex of Grace Church, or walk to High Bridge in a driving storm, for the sake of a trivial loan, when they could not be hired to do honest work for ten dollars an hour. They never know dejection; if they did, they would be philanthropic enough to make a case for the coroner. They rob the credulous and cajole the weak with a zest and cheerfulness which can only spring from a serene consciousness of doing evil. While the good suffer and the deserving starve, they enjoy themselves and grow round with plenty.

Professional borrowers have a knowledge of human nature equal to Shakspeare or Cervantes; and in physiognomy they laugh Lavater to scorn. They often ask loans without getting accommodation; but this does not prove their insight at fault,—only their love for experiment. The demands they make upon the unwilling are tentative efforts to be treasured up as warning in the future. They would never go to the wrong man were not the right one absent. They cannot always have things as they want, and so they take them as they must. The merest novice makes no approaches to the Astors, or Stéwarts, or Vanderbilts; their reputation

has gone before them, and he can discover at a glance that not a single dollar can be torn from their financial souls. Such an absolute incapacity for procuring money gleams from every lineament of the rich, that the rudest savage would recognize it on instinct.

If borrowers preyed upon the prosperous, they would do little harm ; but, unfortunately, they find their victims among those who have not locked up their hearts and thrown away the key. The man who lends is primarily a good fellow ; and that he should be driven into scepticism and cynicism by deliberate swindles, is deplorable indeed. Such shattering of faith is a sin against the race ; and if a professional borrower did not aspire to total depravity, he would hesitate before committing it. But he stops at nothing, except it be the vision of a debt discharged, or the ghost of an unredeemed due-bill.

Hundreds of our citizens, strange as it may appear, are in perpetual dread of borrowers. They are aware that their countenances and their hearts are against them, and that, resolve as they will, they are in danger of being wheedled. They are angry with themselves whenever they succumb to the blandishments they have suffered so much by ; and still, when assailed by a direct petition for a loan, they yield without protest.

Plausible swindlers seem to keep in memory every over-amiable man who will open his purse for the telling of a piteous tale or specious story. They are ever on the trail of such a member of the tender-hearted tribe, and they inevitably run him down. Go where he may, they invariably find him out, and, with wheedling tongue, lick up his substance.

The kind and gentle Horace Greeley was, until the last day of his life, the victim of impecunious cheats. He was opposed, on principle, to giving them a penny ; and yet, in practice, he was a perpetual purveyor to their imaginary needs. For many years, I doubt if any energetic applicant for a loan ever left the presence of the great journalist without carrying his point. During the last twenty-five years of

his life, Mr. Greeley must have lent to entirely irresponsible persons, without the slightest expectation of getting anything back, not far from fifty thousand dollars. Every week he would berate himself for his encouragement of such "confounded loafers," as he styled them, and express his determination to reform his loose and lavish habit. But with the new week would be resumed the open-handed generosity, from the impossibility of saying "no" even to the most transparent impostor.

While entering the Tribune office, the editor would often notice a borrower lying in wait, and tell him beforehand there was no use of asking for money; that he could not get another penny under any circumstances. The cozeners, however, knowing his man, would follow him into the sanctum, and in less than a minute Mr. Greeley would be seen opening his pocket-book, and be heard to say, "Now, take that, and don't come here any more; for I'm going to turn over a new leaf."

Of course the new leaf was never turned over, unless in a backward direction. The journalist's reputation as a succorer of suckers was so firmly established that he drew them from every quarter, and could not shake them off.

Hundreds of other New Yorkers have acquired much the same kind of fame, and are exposed to the same sieges, with similar results. Fearing borrowers as Captain Cuttle feared his landlady, they seek their places of business furtively, and go home by back streets. Not infrequently they lock themselves in private rooms and hide in out-of-the-way corners, to escape itinerant chevaliers of industry. While honorable gentlemen are thus skulking to avoid borrowers, unscrupulous debtors walk composedly through the crowd, and stare their creditors out of countenance — thus showing the outward advantage that dishonesty possesses over uprightness and fair dealing.

Some persons have been victimized so often, that they have hung up placards like these in their offices:—

"No money lent here in sums less than ten thousand dollars."

"All applicants for loans are expected to furnish mortgages on real estate in the city."

"Gentlemen desirous of borrowing are referred to the Rothschilds, in London, Paris, and Frankfort."

"First-class collaterals required on all loans."

"Rates of lending to-day, five per cent. a minute, and nothing received as security except double eagles."

"Persons who are hard up are politely, but firmly, requested to go to the devil."

The effect of these announcements is reputed to be excellent. In numerous instances they prevent professionals from revealing their chronic wants; in others, they abash fellows who had made up their minds to arrange for a loan; and in others again, they cripple the hopes formed of a successful swindle.

I have been told, by a person who tried the experiment, that these manifestoes have saved them thousands of dollars a year, and an infinite amount of annoyance besides. Such placards certainly have a fine extinguishing effect upon the flaming ardor of the social highwaymen so superabundant in Gotham.

The length of time that a borrower (outside of business) has been plying his vocation may be determined by the amount he asks for. When he is rather new to the trade, he wishes usually to be accommodated with a loan of five hundred dollars, and, if that sum be inconvenient, he thinks he can get along with something less. He has been known to accept thirty or forty cents on the dollar of his original proposition, and generally it is not safe to offer him any sort of compromise.

After a year or two of genteel swindling, the borrower fixes his demand at from one hundred to fifty dollars, but can

be induced to take twenty-five dollars as a sort of instalment on the obligation, which he fancies the community has, in some mysterious manner, incurred.

Ten-dollar swindlers have, for the most part, seen much dishonorable service, and are among the most numerous of their nefarious guild. They are to be found everywhere, — in the street, at the hotels, at the theatres, at the races, even at private parties sometimes, — where they make the stereotyped excuse that they have left their porte-monnaie in another coat, and that they would be profoundly obliged for a trivial loan until the day following.

The petty impostors, who solicit loans from five dollars to fifty cents, have usually met with so many rebuffs that they make their approaches with a diffidence that usually undoes them. They mention five dollars with an infirmity of voice, evincing that they have no expectation of obtaining it, and drop down to three, two, or one with a precipitancy revealing their familiarity with disappointment. As a last resort, they inquire dolefully for postal currency representing half a dollar; and it is seldom they fail to get it, through sheer commiseration, from the person besought.

One of the most transparent and impudent orders of swindlers are those who tell you they are in a certain strait, and could be easily helped if they would apply to their father, brother, or some other near relative. But they are too proud, they take pains to inform you, to demean themselves in that fashion, and therefore they have recourse to a stranger on whom they have not the slightest claim. This mode of borrowing, an insult to the lowest intelligence, deserves to be answered with the boot; and yet, as it involves a certain sort of flattery, it frequently meets with a practical response.

It is estimated that, independent of all regular or mercantile transactions, the denizens of New York lose from five to six million dollars annually by swindlers claiming to be philanthropists, reformers, scholars, business men, and gentlemen in temporary distress. These miscellaneous borrowers have pretexts of every kind, all of them appealing to the best part of our common nature, if they were only true.

The sole difference between professional borrowers and beggars is, that the former always promise to pay, and the latter never promise, though one can be as much depended upon for settlement as the other.

Such recurring calamities as visit these unblushing negotiators of loans might have been gathered from the multitudinous woes of the Greek tragedies or the grand operas. The borrowers are very seldom unprovided with a dead mother, or an unburied wife, or starving children, or a dishonest partner, or a stolen pocket-book, or a deferred remittance, or an absolutely necessary journey, or a remarkable mishap of some sort. They infest the principal hotels at the busy hours of the day, and employ their best energies in introducing themselves to the pockets of the boarders. Nearly every public house appears to have its special haunters, and one ingenious story will serve their purpose for a month or more. Borrowing has long been systematized here, and every season is marked by new inventions and pathetic fictions to delude the generous and unwary.

The audacity of the professional borrower is grand and exalted. He will stop your carriage in the park, and invite you to a pecuniary desperation; will make known his financial embarrassment as you are walking out of church with the present or future Mrs. — on your arm; seek a private interview, with a monetary purpose, before you are up in the morning.

If you were to be hanged, — of which there is no danger in New York, whatever crime you may commit, — he would steal up behind the sheriff, as the latter was drawing the black cap over your eyes, and ask you if you could not spare ten dollars, now that you were going to a country where national bank-notes are not current.

Most New Yorkers understand so thoroughly the trick of courteous cozening, that, whenever any man they do not know intimately seems anxious to see them, they are convinced that he is in quest of a loan, and in nineteen cases out of twenty their convictions are just. Neither friendship, nor

love, nor detectives can trace a fellow to his lair, or scent out his sanctuary, like a borrower. He will pursue his game round the world, and shame a sleuth-hound from the start.

"Lost in the great city" is often a sad truth; but it may be converted into a fiction if a man in need of money have his attention called to the pocket-book of the person supposed to be lost. You cannot so bury yourself in this Babylon of a new world that the borrower will not bring you to light. And, if you have had experience, when a stranger flatters you, you will understand, from the degree of his compliment, the exact amount of the loan he expects to obtain.
